LONDON

CAPTAIN E. ALTHAM, *Secretary, Editor and Chief Executive Officer, Royal United Service Institution.*
 EDWARD N. da C. ANDRADE, *Quain Professor of Physics, University of London.*
 SIR T. W. ARNOLD, *Professor of Arabic, University of London.*
 JOSEPH BARCROFT, *Professor of Physiology, Cambridge.*
 VERNON H. BLACKMAN, *Professor of Plant Physiology and Pathology, Imperial College of Science and Technology, London.*
 REVEREND J. S. BOYS-SMITH, *Fellow, St. John's College, Cambridge.*
 CLOUDESLEY BRERETON, *Late Divisional Inspector for Modern Languages to the London City Council.*
 MARGARET BRYANT.
 S. A. COOK, *Lecturer in Hebrew and Aramaic, Cambridge.*
 THE LATE SIR THEODORE COOK, *Formerly Editor of The Field.*
 A. S. EDDINGTON, *Plumian Professor of Astronomy, Director of the Observatory, Cambridge.*
 H. J. FLEURE, *Professor of Geography and Anthropology, University College of Wales.*
 T. C. HODSON, *Reader in Ethnology, Cambridge University.*
 JULIAN HUXLEY, *Fullerian Professor of Physiology in the Royal Institution.*
 DR. W. S. LAZARUS-BARLOW, *Formerly Professor of Experimental Pathology, Middlesex Hospital Medical School, University of London.*
 CAPTAIN B. H. LIDDELL HART, *Military Historian and Critic.*
 H. M. J. LOEWE, *University Lecturer in Rabbinic Hebrew, Oxford University.*
 ROBERT LYND
 C. A. MACARTNEY, *H.B.M. Acting Consul for Austria, 1921-6. Intelligence Officer, League of Nations Union, 1926.*
 S. H. MELLONE, *Lecturer, Manchester College, Oxford.*
 SIR L. CHIOZZA MONEY, *Parliamentary Secretary to the Ministry of Shipping, 1916-8.*
 G. T. MORGAN, *Director, Chemical Research Laboratory, Department of Scientific and Industrial Research.*
 J. H. MORGAN, *K.C., Professor of Constitutional Law, University of London.*
 R. H. RASTALL, *University Lecturer, Economic Geology, Cambridge.*
 F. M. STENTON, *Professor of History, University of Reading.*
 D. F. TOVEY, *Reid Professor of Music, University of Edinburgh.*
 ABRAHAM WOLF, *Professor of Logic and Scientific Method, University of London.*

NEW YORK

ISAIAH BOWMAN, *Director of the American Geographical Society.*
 CHARLES R. BROWN, *Dean of the Divinity School, Yale University.*
 HENRY SEIDEL CANBY, *Editor of the Saturday Review of Literature.*

 SAMUEL W. REYBURN, *President, Lord and Taylor, New York.*
 GRANTLAND RICE, *of the Herald Tribune, New York.*
 JAMES HARVEY ROBINSON, *Formerly Professor of History, Columbia University, New York.*
 ADMIRAL W. L. RODGERS, *of the United States Navy.*
 CHARLES H. SABIN, *Chairman of the Board, Guaranty Trust Company, New York.*
 DAVID E. SMITH, *Professor Emeritus of Mathematics, Teachers College, Columbia University.*
 ELMER A. SPERRY, *Chairman of the Board, Sperry Gyroscope Company.*
 CLARENCE G. STOLL, *Vice President, Western Electric Company.*
 DEEMS TAYLOR, *Editor of Musical America.*
 E. R. WEIDLEIN, *Director, Mellon Institute of Industrial Research, Pittsburgh.*
 FRANK C. WHITMORE, *Chairman, Division of Chemistry, National Research Council, Washington.*
 C. C. WILLIAMSON, *Director of Libraries, Columbia University.*

EDITORIAL PREFACE

FORMERLY prefixed to encyclopaedias were general dissertations upon the body and divisions of knowledge, its life and advancement, its inspiration and utilities. D'Alembert's stately and vivacious discourse, introducing Diderot's *Encyclopédie*, "war-engine" of information and ideas before the French Revolution, filled more than forty pages. More voluminous, and considered more luminous by some at the time, were the prefatory essays by Dugald Stewart and others to early editions of the present work. This elaborate fashion has fallen out of use in all countries for an evident reason. Any attempt to give a unifying impression of the total sum, and a distinct sense of the countless components, of modern knowledge, as presented in many thousands upon thousands of ensuing pages, has long since passed beyond the power of man. The editorial introduction is still a necessary part of the archives of an institution like the *Encyclopædia Britannica*, now in its 160th year of existence and renewing itself at definite periods from one generation to another. But the preface must devote itself to a statement of the spirit animating this newest design; of the scope of its contents and what is most notable in their character; and of the methods whereby the whole has been framed.

Complete reconstruction now appears. The Fourteenth Edition is a "new model." Why this has been required by the duty of the task must be explained. Demanding a re-survey of all the realms and fields of information, to ascertain and embody the changes of twenty years, that task was found to be more extensive and intensive than had been imposed by the passage of any equal interval in the records of the *Encyclopædia Britannica*. A fresh system of construction was advisable. The system adopted required a large corps of Associate Editors each of them charged with the more or less autonomous organization of a main department. This method, never before brought into play on the same scale, is the vital principle of the "new model." At the same time, it was resolved to employ for the Fourteenth Edition, and upon a scale never attempted by any encyclopaedia before, every modern resource of illustration, including colour-printing. The scope and detail of this latter development are explained towards the end of the present *Introduction*.

THE ENGLISH-SPEAKING WORLD

THIS Edition, then, is the Fourteenth of the series which began with the modest issue of six-penny numbers ("or 8d on fine paper," said the Edinburgh printers) in December 1768 when George III. was King. The talk was all of Mr. Wilkes and of floods higher than could be remembered, spreading in many counties "like a sea." "Luckily," wrote Horace Walpole, "America is quiet."

The Thirteen Colonies, with Canada, were still an integral part of the Old Empire, and the English-speaking

world was undivided. The numbers of those native to the mother-tongue or well acquainted with it were then about 14,000,000; they are now about 200,000,000. Recent years have enhanced their position and responsibilities among the peoples of mankind, and in several respects transformed their relations. Two-thirds of them belong to the United States and to Canada across the open frontier.

Even the earliest issues of the *Encyclopædia Britannica*, in a language already transoceanic, never were strictly insular in scope. Like the Authorized Version and Shakespeare; like Bunyan, the Spectator, Robinson Crusoe and Gulliver's Travels; like Locke, Blackstone, the great novelists, Gibbon and Adam Smith as they came out in their turn—the several eighteenth-century editions passed more and more across the Atlantic in those boxes of books so eagerly awaited by many active-minded Americans. We know from an incidental remark in one of Burke's speeches, that, when the *Encyclopædia Britannica* first came out, nearly as many copies of Blackstone's Commentaries were demanded by the Thirteen Colonies as by all Britain. George Washington possessed a copy of the *Encyclopædia Britannica*'s Third Edition, which began to appear just when the United States was established and the French Revolution was imminent. Shortly after the middle of the nineteenth century the English readers overseas became more numerous than those living in the old islands. Now, the former are not far from being three times as numerous. Only by means of this expansion, especially during the last two generations—that is, well within the life-time of many persons who

will use these volumes—has the English tongue become so mightily predominant amongst the languages of western civilization. So recently as the 'Eighties of the last century the total number of its speakers rose to one hundred million. They have doubled in little more than forty years.

The *Encyclopædia Britannica* has remained through these changes the organ of general reference for the whole world-family. By the compulsion of that enlarging tradition, it must embrace fully the especial interests—geographical, historical, social, economic—of the multiplied communities of English-readers in three continents where once that language was unknown. Increase and change, advance and diversity, amongst that heavy majority of inheritors of the mother-tongue dwelling beyond its mother-island—that is one reason for the extent of re-construction and readjustment now shown.

MASS AND MINUTENESS OF PRESENT KNOWLEDGE

YET not the chief reason. Knowledge has its frontiers and boundaries, its networks of finer demarcating lines. But they are not drawn nor limited by race or speech. The collective knowledge possessed by mankind is like a universal and indivisible Mind and is of necessity more important for encyclopaedic purposes than that of the 200,000,000 English-speaking people alone. From some points of view, incomparably more important.

To refresh our sense of this salutary truth, we must glance at the origin of modern encyclopaedias and at the rapid evolution which alters their appearance and substance in each successive generation; more than ever in ours. Their ancient and mediaeval history will be found elsewhere under their heading. From the Renaissance and the Reformation; from the art of printing and revival of the classics; from wide discovery by land and sea and sky; from an epoch of double and triple revelation concerning man and the Earth and the heavens—we date the New Knowledge and the new spirit of enquiry. Again from Bacon and Harvey and Galileo, onwards through the great seventeenth century to Newton and Leibnitz, we have a double process still unceasing—now represented by incomputable accumulation of knowledge, with intense minuteness of research into its smallest elements. The telescope and microscope became efficient auxiliaries. (One day, spectroscopy would follow.) Thenceforward, human thought, reborn to free imaginative quest but bringing to bear vigour and penetration of attack on all appearances and all assumed voids, equipped itself by degrees with those instruments of vision and precision which to ordinary persons at present seem numberless in array and miraculous in exact ingenuity. In this second quarter of the twentieth century, the magnitude of amassed knowledge is such that the intellect of a Bacon or a Leibnitz by indefatigable pursuit through a long life could not hope to master more than a fraction. Many are the main divisions, myriad the subdivisions, endless the intricacies. But the methods of further wide conquest, and of still

more delicate and piercing analysis, are being brought always to further degrees of power and finesse.

EARLIER AND LATER ENCYCLOPAEDIA-MAKING

HENCE encyclopaedias, containing the digest of all libraries, are more and more necessary. They were and remain an indispensable arm of intelligence to experts. No less have they become so to the generality. It has been surmised, indeed, that up to two hundred years ago an ability as majestic and elastic as that of Leibnitz, if devoted only to the object of acquiring all information as then existing, might have succeeded in grasping and retaining the whole of it. This conjecture we may well doubt when we remember for example the folios of Tilletmont and Moréri, of Bayle's Dictionary and d'Herbelot's Oriental Compendium, to name only some French compilations; and the Alps of printed matter piled up by that time in other modern languages. Assuredly, soon after that era, it was no longer possible for any mortal brain, however sovereign in capacity, to entertain the most fleeting dream of attaining by superhuman exertion to "know everything." That frequent foible of scholastic ambition in the middle ages was for ever past. Now, it is as impossible for any single mind to know exhaustively any group of studies; or, independently of reference, any single study. For absolute mastery of one sub-section of one subject an unflagging half-century may not suffice. Further on, we shall see that the makers of encyclopaedias, for their part, are confronted with difficulties of increasing severity by this unbounded extension, with closer intensiveness, of thought and practice. With endless aggregation of knowledge and microscopic scrutiny of its particulars goes the multiplication of man's practical contrivances.

From the middle of the eighteenth century, encyclopaedias became a habit and a stimulus and a familiar part of the civilized apparatus. Developing from English incentives—but in Zedler's *Universal Lexicon*, over sixty volumes still respected, German erudition was already more solidly regimented than elsewhere—Diderot and his collaborators made their *Encyclopédie* a renowned historic force. An armoury of challenging ideas as well as a general storehouse of ascertained information, it was full of nimble description and temporary theory. The political obstacles and dangers surmounted were, let it be granted, extreme; the accomplishment heroic; the immediate social effect unprecedented then, and beyond emulation by any later work of this kind. None the less, the purely encyclopaedic affairs of comprehensiveness, proportion and arrangement were small by comparison with present work of that character. Voltaire said that the *Encyclopédie* was half marble, half wood; d'Alembert likened it to a harlequin's coat.

THE ENCYCLOPÆDIA BRITANNICA IN THE NINETEENTH CENTURY

WITHIN little more than a generation after Diderot's death in 1784, the *Encyclopædia Britannica* began

to acquire an international primacy amongst works of reference. We must glance at its former editions and supplements since 1768 onwards. The five editions in the half-century from 1768 to 1817 need not detain. The work, though counting a good and growing minority of American readers, and progressing in size from three volumes to twenty, was still mainly an insular matter. The island already was the home of steam-power, machinery and the industrial revolution. English books, as yet, were published in a language not by any means foremost in extent of use amongst the tongues of western civilization. It did not reckon yet as many readers as either French or German claimed. After Waterloo, Britain stood out as the foremost nation in power and finance and trade; in machine-industry, technical invention and decisive insight into the future of the physical sciences; in political and economic ideas; and also in originality of literature and art. Shakespeare inspired Dumas to pioneer, in 1829, the triumph of romanticism in Paris. Scott and Byron had a wider active influence in the world, especially in France, than Goethe. The exhibition of John Constable's pictures in Paris, in 1824, opened across the Channel a new era of landscape painting. Deeper powers, hardly to be understood abroad, were Wordsworth and Turner expressing in poetry and colour the atmospheric and almost incommunicable mysteries of island imagination at that great time.

Archibald Constable was then the "great Napoleon in the realms of print." He had become proprietor of the *Encyclopædia Britannica*. His munificent impulse inspired a six volume Supplement (December 1816 to April 1824) which was much more than insular. It enrolled eminent foreign contributors as well as brilliant talents at home. Continued and enlarged ever since, this example of wider fellowship gave the *Encyclopædia Britannica* its impress of world-thinking.

During the next half-century or so (from 1823 to 1875), the Sixth, Seventh and Eighth Editions were successively current. The chief contributors were always a strong band; Lord Macaulay as conspicuous in the later ranks as Sir Walter Scott in the earlier. But while, in a long period, the whole spirit of thought and enquiry had changed, there was no fundamental change of plan in this encyclopædia. In the mind of man, former conceptions of life and the universe were beginning to be revolutionized by the cumulative effect of innovating thinkers and workers in many fields. The external activities of man had begun to be revolutionized no less, by industrial mechanism and engineering, by railways and steamships, by the telegraph, by the progress of applied science in every line. Charles Darwin, to name only one of the innovating workers and thinkers, may appear in the ultimate perspective, for all the quietness of his personality and methods, a more potent figure than Shakespeare, Kant, Napoleon or Goethe. And Karl Marx was Bismarck's contemporary. But even in the Eighth Edition, which remained more or less in use up to the last

decade of the nineteenth century—that is, up to a date forty years after the publication of the epoch-making "Origin of Species"—the traditions of style and arrangement derived from the eighteenth century were not radically disturbed.

ROBERTSON SMITH AND THE NINTH EDITION (1875-1889)

A CHANGE came with the Ninth Edition, still celebrated. It keeps a name of monumental impressiveness and never can be disregarded by any historian or student of the state of civilized knowledge and thought in the latter part of the nineteenth century; especially during the fateful period in politics from the Franco-German war in 1870-71 to the accession of William II. as German Emperor in 1888. The forces of public control in that period were on the whole what may be called orthodox. But in every field of life and thought, small, trenchant minorities—foreshadowing as usual large movements of the future—challenged all orthodox positions. The massive Ninth Edition, with all its qualities, had an inherent disadvantage in the slow intermittent method of publication by volumes at intervals. From inception to completion this Egyptian achievement occupied about eighteen years. Much in the basis was antiquated when the apex came to its point. The editors indeed were conspicuous in ability and fortunate in circumstances of "time-space" belonging to a bygone age. If Baynes who began the work was no ordinary man, his assistant and successor William Robertson Smith, was, in this kind of duty, a great man—an organizer of thorough intellectual team-work on a scale of combination seldom equalled. His own articles on Biblical themes and Oriental origins were learned and bold. In a manner recalling Diderot's old troubles, a battle of belief ended by his removal from his professorial chair. Apart from this controversy on the Higher Criticism there was nothing very perturbing in the weighty volumes appearing at their uncovenanted times. The aim was exhaustiveness in the treatment of main subjects rather than extension of headings to cover as many subjects as possible—the proper object of modern encyclopædias for general use. As a result the imposing and, as it were, "many-mansioned" structure was most notable as a collection of treatises so full and excellent that many of them were, as others might have been, reprinted as books.

Thus there were three serious defects in this grand achievement when at long last it stood complete. The first volumes, prepared in the early 'Seventies, were old-fashioned when the last volume appeared in 1889. To terminate this old and obsolete system of production would some day be the next step in the making of great encyclopædias. The Ninth Edition was unwieldy in use. Book-like treatises, admirable to peruse with time enough, were not so convenient for reference in emergency. Above all, the treatment of science by experts for experts, was far beyond the understanding of the

vast majority of users. On this plan, many newer interests of mind and life could not be adequately reflected.

THE ELEVENTH EDITION (1910-11) AND ITS SUPPLEMENTS

YEARS were to pass, and the twentieth century entered upon, before the worst of these difficulties—protracted, intermittent publication—was overcome by the resources of Anglo-American effort. This association properly corresponded at last to the position of the *Encyclopædia Britannica* as the principal organ of reference for the English-speaking world as a whole. Mr. Horace E. Hooper, a man of genius, was an American who loved England, cherished the traditions of this work, and brought enthusiasm to its service. Coming to London, he first gave the Ninth Edition, for all its massiveness, a far larger vogue than it had ever approached before. He did this by allying it for some years with *The Times*. He initiated in 1902 a Supplement in no less than 11 volumes, Sir Donald Mackenzie Wallace and Mr. Hugh Chisholm being joined in the Editorship with President Arthur T. Hadley of Yale. Thus, he constituted the Tenth Edition.

Then, after thirty years since the last enterprise of the same magnitude had been undertaken, an entire renovation was planned. Executed under Mr. Chisholm's editorship, the Eleventh Edition appeared at the end of 1910 and beginning of 1911 under an arrangement with the Cambridge University Press. By a stroke of insight and resolution, unprecedented in this field, involving large expenditure and nevertheless perfectly successful, all the 29 volumes were published nearly simultaneously. This meant a public advantage hardly to be measured. The work was more nearly an organic whole. It represented, approximately, the latest state of knowledge in most divisions at the date of its appearance. Before treating of it further, we may note briefly that the addition of a three-volume Supplement prepared immediately after the World War, under the editorship of Mr. Hugh Chisholm with Mr. Franklin H. Hooper as American Editor, and mainly devoted to that upheaval of the world, constituted the Twelfth Edition in 1922. In that year Horace E. Hooper died too soon (and too soon Hugh Chisholm was to follow him) but the great system and spirit of English-speaking co-operation remained. Without that, it would have been impossible in post-war circumstances to continue the work on its former scale.

Another three-volume Supplement prepared under the Editorship-in-Chief of the present writer and in intimate colleagueship with Mr. Franklin H. Hooper, as American editor, came out in 1926, and was added to the 29 volumes issued in 1910. Thus was formed the Thirteenth Edition. The purpose of this final Supplement was to reflect, as fully as the available space enabled, all the new knowledge and evidences characteristic of the latest extraordinary phase of the world of knowledge and the other world of activities.

This effort was found to be of great experimental uses. It brought out with unexpected force several considerations. Separate matters needing to be dealt with under their own headings had greatly increased in number; information concerning every main subject had been similarly augmented in one decade and a half; even in so short a period many former standpoints of intellect had been for ever displaced; familiar conceptions of life and the universe were very widely altered. Plainly another reconstruction of the whole *Encyclopædia Britannica* was imperatively required. That formidable undertaking could be confronted the sooner because the final Supplement had encountered in advance, and solved in broad principle, the new problems of comprehensiveness and proportion in encyclopaedia-making at the present day.

"SPACE-TIME" AND "RELATIVITY" IN PRACTICE

THE late Lord Bryce said that every successive undertaking of this kind is "a sort of landmark in the history of knowledge." It is an enduring part of the records of its era. It must exhibit more or less the ideas and circumstances of a given generation; the range of mind in the period, and the play of actual life in all its outward forms. Behind the millions of details dealt with, it must show what were the prevailing affirmatives and the "obstinate questionings," what different ways and modes of *Weltanschauung* were striving for ascendancy. Here enters the duty of explaining more particularly why this Fourteenth Edition, appearing so close to the fourth decade of the twentieth century, is very distinct in design; and by what new means the construction has been effected.

We saw above that most of the territories of knowledge had been re-surveyed beforehand and their relative areas demarcated anew. Owing to this preliminary advantage, and to the system of co-editorial organization subsequently employed, it became possible to do in one way what had never been done. The Fourteenth Edition, by division of labour amongst the distinguished corps of co-editors administering the new system, has been produced in less than three years. This contrasts with the seven years employed on the Eleventh Edition and the eighteen years on the Ninth. The advantage here is conspicuous. All the volumes, animated through and through by freshness of mind, are abreast of the most recent information and research. Severe philosophers have dreamed of an ideal encyclopaedia taking a century to complete. That would lose the vital function. Its earlier portions would wither as the later came forth—a process like lighting candles in a long row and beginning when half-way to quench an early wick for each new one kindled. Or, alternatively, this kind of ambition may remind us of Andrew Marvell:

"My vegetable love would grow

Vaster than Empires, and more slow."

Ersch and Gruber's cyclopean compilation for strictly learned readers was founded more than a century ago

and having reached nearly 170 volumes is still unfinished. Dr. Merz in his *History of European Thought* makes a very practical observation upon this ponderous, interminable endeavour: "The promoters of it were evidently not sufficiently impressed with the two very essential conditions which make a work of this kind useful—*viz.*, that it must be finished, however imperfect it may be; and that it must be completed within a limited time, on account of the revolutions, and smaller changes, in thought and knowledge."

An equal factor with that of the time to be occupied upon this undertaking was the question of space, in the printer's sense, to be filled. It was judged reasonable to confine this Fourteenth Edition to twenty-four volumes. Nothing could be more facile and agreeable, given unlimited endowment and sufficient disregard of ordinary needs, than to produce in one decade an encyclopaedia running to a hundred large volumes—or even to a thousand and more according to Chinese precedents. But in practice it has been discovered that, beyond a certain point, usefulness for frequent reference diminishes as the stretch of volumes extends. In these matters, modern life allows less leisure to search and creates more need to find. The larger the number of volumes the easier is the task of editorial staffs and contributors. But by the extreme tribulation of those colleagues the modern general reader gains much. The plan of largely increased comprehensiveness within a given space enforces utmost compression without sacrifice of essentials or lucidity. In the process, each department of knowledge stresses valiantly its own paramount claims to latitude by comparison with the rest. Many devoted contributors cry humanly like Thackeray to Macvey Napier, "You are cutting away my flesh and blood." But the provision of a hundred volumes or more would not, in the last adjustment, solve these relative questions.

At first notion, twenty-four volumes each of some thousand pages in double columns, may seem an ample allowance for any human purpose especially when one considers that the twenty-four volumes contain thirty-five million words, the equivalent of 500 ordinary octavo books. The real fact, of course, is that a separate encyclopaedia for history, or for religion and philosophy, or for the physical sciences, or for international biography, or for law alone, not to speak of literature, might run to as many volumes, without containing one dead word. To attempt within the same limits, at this advanced stage of the twentieth century, a digest of universal information, as now assembled and differentiated—with its extent outranging the view of any one intelligence at any one moment; with its infinity, to speak figuratively, of molecules, atoms, particles and "wavicles", with its many divisional labyrinths themselves holding maze within maze—to attempt this was to face a task so redoubtable that no former method of organization could cope with it. The system of editorial association adopted has been men-

tioned at the outset. How it has worked, we shall see presently. But, first, compare in broadest terms the existing outlook of mind with that of twenty years ago. Then, the work on the last standard Edition was approaching its close; the general contents and arrangement were already determined.

TWENTY YEARS AGO

THE Eleventh Edition was begun in 1903 and finished, so far as the writers were concerned, in 1910. We may assume safely that its general standpoint cannot be dated later than 1908. It discussed some paramount subjects, like "Atom," in terms that are now ancient. "Cosmogony" was mainly mythological. "Electron" received only a few lines. There is no article on "Isotopes"; nor on "Quantum Theory" nor on "Brownian Movement." Turn to the biological side. The general article is confined to a couple of pages. "Hormones" have no heading and are only mentioned in a few sentences here and there. Not only is there no separate article on Biochemistry; it is not mentioned in the index. Einstein's earlier work on Relativity had been published but he is not mentioned even in the Index. These are but a few illustrations taken almost at haphazard. There was a very little about the "Cinematograph." At that date there was, of course, nothing about "Broadcasting." "Flight and Flying," as then treated, are but a record of the first infancy of these subjects. There is no separate contribution headed "Aeroplane." The themes of motors and motoring were then small and simple beside what they are now. It was the same and more markedly with "Wireless." A few pages about it came under the head of "Telegraph"; and nowhere is there any anticipation of "wireless" telephony. There was an excellent article of four pages about "Matter." Nothing at all, to anticipate a little, is more characteristic of the present Edition than that "Matter"—though everything concerning it receives more elaborate and subtle treatment than formerly—appears as a cross-reference guiding the reader to the pertinent articles written by contributors amongst the greatest of living experts; including many whose international pre-eminence has been signalized by the Nobel Prize. On the side of scientific thought and practice, generally, the difference between the Eleventh Edition and its present successor is like an advance not of twenty years but of a hundred. Between ordinary ideas in the first decade of the twentieth century and those in its second quarter the intervening World War made a gulf, if we reckon with psychological effect in all spheres as well as with external convulsions. But, far hence, even the World War may seem subordinate by comparison with the revolutions of scientific thought in our time.

CHANGES IN TWO DECADES

I. Thought

THE map of the intellectual world, more than that of the political, is changed beyond recognition. On every

side we see new mechanisms and agencies with consequent new social activities and habits: in many ways we are farther from the youth of our grandparents, even from the youth of our parents, than were they from the middle ages. This is ordinary evidence to the physical eye. But let the eye of the mind turn to inward views. In every direction new prospects and vistas stretch out. Studies amongst the most ancient are transformed, as, for instance, may be seen at once from contributions to the Fourteenth Edition by scientists like Professors Eddington, Michelson and Sir J. H. Jeans. In all the physical sciences, interacting more and more, the marches of experiment and perception during the last couple of decades are known even by every layman to be very wonderful. Many authorities pronounce that ideas in this sphere have been more profoundly altered than ever before in any equal period.

The new views concern every notion of form and substance and movement; the nature and working of matter itself; electromagnetic action as a pervading principle; the constitution and play of the atom; the origin and laws and effects of radiation; the relations and mutations of elements; above all, the deliberate, intermittent emission and absorption of energy throughout what we call the universe and space. These views by an astonishing succession of intellectual and experimental achievements have largely and for ever removed former acceptations of human thought. The mental habits of two thousand years and more are overturned by several propositions:—(a) the electric theory of matter; (b) the theory of relativity instead of former notions of absolutes and “iron laws”; (c) the conceptions of Time as an operator as well as a recorder—of Space as a process as well as a volume—of Time-Space as a blend, and, inseparably from this, the suggestion of Energy-Matter as another blend; (d) the perception of “Things” as “Events”; (e) the strange quantum laws showing that the sources of energy are not in continuous smooth flow, as lately supposed, but work by strictly measured jets and pauses, or shall we say (though it is illustrative, not scientific) by rhythm like heart-beats and poetry. None but an expert dare go in passing beyond simple mention of these mysterious “quantum laws” of inter-atomic action now held to determine, by delivery or reception of absolutely regulated amounts of energy, and those only, all the radiating vibration of what we call matter. Perhaps laws behind or beneath all other laws. But Professor Andrade remarks in another volume of this edition: “The explanation of matter in terms of electric charges was the great achievement of the first quarter of the present century. The next period bids fair to be one in which electric charges and radiation will be explained on a common basis as different manifestations of something more fundamental.” So, Professor Eddington writes (in *The Nature of the Physical World*) that “An ideal shines in front of us, far ahead perhaps but irresistible, that the whole of our knowledge of the physical world may be unified into a single science.”

Sir J. H. Jeans adds (in *Astronomy and Cosmogony*): “Clearly our physics and chemistry are mere fragments of wider-reaching sciences.” Geology and crystallography, popularly supposed to be amongst the more immobile studies, are animated in contrasting ways by the new insight into modes of action and formation. Chemistry, made inseparable from physics, connects itself by the recent rapid advance of biochemistry, with the secrets of Life; and none can set narrow limits to the practical possibilities of work in this direction.

Though biological sciences have not been as much as the physical transformed by single propositions, their course in the last twenty years has been that of revolution by gradualism. This results from the restless perseverance of research into the composition and behaviour of living matter; into its cells and tissues; into what we may call its internal administration and regulation; into its preservative needs and destructive hazards; into former suppositions concerning sex, heredity, growth, longevity and the possibilities of influencing all of them by scientific intervention. The rediscovery of Mendelism at the beginning of this century led to the throwing of great light upon the cell as the tenacious but susceptible unit of life; upon heredity and sex; and the possibilities of modifying “nature” by intellect. Methods of micro-dissection have been so far more perfected that objects $1/5,000$ part of an inch long can be manipulated and even dissected inside the living cell. Evolution is the assumption of all science; and Darwinism, after re-examination, is accepted by all biologists. There is a sudden awakening to the social and economic—let us say the immensely “practical”—value of biology. The world of human concerns has no more urgent need than that of more trained workers of every nation in this field. Attention was drawn not long ago to various analogies respecting form and behaviour between physical atoms and some kinds of living organisms. To the interested outsider, the present atomistic view of the processes of life, biology and physics throwing cross-lights on each other, seems yet another instance of a unifying tendency in science. This is perhaps amongst the greatest things of the age. Medicine and surgery respond in saving practice. In a longer view, no doubt, the second law of thermodynamics, the decree of “running down,” still points inexorably to the final death of the universe. But only after millions of millions of years. By nearer views concerning man we are taught to look on natural death itself as a biological novelty, incident to the latest and highest organisms, which in the end may become normally a deferred and tranquil conclusion exempt from disease. Biology and psychology are indissolubly associated. In effect, ultimately, on the future of civilization this may prove not inferior to any contemporary hint.

At the same time, the progress of spectroscopic analysis and stellar photography searches the Sun; extends the census of the stars and the nebulae; enables man to analyse more deeply their chemico-physical composition and activities; their internal proceedings and the stuffs

whereof they are made; their ways of birth and being and passing. "He weighs in his hands the stars; sifts them as gold-dust." Space and Time? All our ideas, up to a few years ago, of what we called "Space" are confounded when we must regard our whole solar system as a speck amongst many thousand millions of stars. In the newer astronomical thought, largely aided by the 100-inch reflector at Mount Wilson, the whole host of stars again appears as a pygmy array by comparison with the stupefying dimensions and distances of the nebulae outside them—the giant nebulae, larger than a thousand million suns, so remote in "Space" that light from them takes over one hundred million years to reach our planet. Well may Sir J. H. Jeans speak of "the magnificent, stupendous, almost terrifying universe" revealed to present astronomy.

And so with all our ideas up to a few years ago of what we called "Time." We have noted that from the farther nebulae, light, though travelling with almost unthinkable velocity, takes over one hundred million years to reach us. By comparison with twenty years ago, the geologists have put back by aeons the origin of man; they demand a far longer antiquity for the Earth; the astronomer reckons that the Sun, at lowest estimate, is older than the Earth to a degree not genuinely conceivable by the mind. According to an idea suggested by Sir J. H. Jeans, if in fancy we considered the Earth as aged 100 years, the human race would be little more than four days old; and all its civilization and knowledge a creation of the last few minutes.

Einstein by his doctrine of Relativity seems at present quite likely to modify the whole of human thinking as Darwin did in the nineteenth century, Newton in the eighteenth, and Bacon in the seventeenth. And this by altering those very concepts of Space and Time and other main attributes of the physical world, which ordinary educated minds up to yesterday regarded as the fixed foundations of intelligence. This must modify deeply the mood of civilized intellect and its way of approaching every subject. Not only do we see Physics, the most fundamental of the sciences, revolutionized and transformed. The whole mental method and outlook of mankind are modified. With regard to any question whatever, habits of looking and assuming that had lingered for over two thousand years, have been broken in the last two decades. Long before, Lotze had pointed in this direction when he defined "a thing" in effect as "something standing in relation." "Reality contains nothing that is or could be isolated in its own pure existence and out of all relation" (*Microcosmus*, Book IX, Chap. I.). Dr. Einstein himself has written: "What is *a priori* certain or necessary respectively in geometry (doctrine of space) or its bases? Formerly—we thought—everything; yes, everything. Nowadays—we think—nothing." And one of his disciples puts it: "Space in itself and Time in itself sink to mere shadows, and only a kind of union of the two retains an independent existence." Yet every discovery suggests so much more to

be elucidated that each of the "widening chambers of surprise" brings science to another door hard to unlock. Einstein's mind, assimilating all the scientific and philosophic work of a number of remarkable contemporaries, has introduced a series of memorable simplifications. To many, the enigmas thus simplified seem more impenetrable. Not so to others. One of the great and veteran contributors to the *Encyclopædia Britannica*, Sir Oliver Lodge, writes in the present volumes (*Physics*): "All we can do now is . . . to realize that nothing like the last word has been spoken, to wonder at the genius which has so greatly illuminated and yet partly confused us, and to have faith in the advent of a great generalization." Curious, as has been noted, are some new analogies between living matter and what we yet name non-vital activities. In a word we have come again, in these twenty years, to regard the cosmos as more an organism than an engine.

II. Mechanisms and Customs of Life (1908-1929)

CONTRAST with these abstruse and chastening speculations an utterly opposite kind of picture. The outward activities of man presented a swarm of fresh forms when the collaborators in this Edition turned to the worldwide survey of what is called practical life. In ordinary human habit and its familiar appliances, there is, let us repeat it, as much difference in many ways between the present and the preceding generation as between the latter and the middle ages. In the last two decades the mastery of the air—effected by the heavier-than-air machine in the manner that seemed at first most daring and improbable—has surpassed in everyday usage a classic fable which even when this century opened seemed the vainest dream of antiquity. The Atlantic has been flown both ways. These isolated exploits may foreshadow regular services before another two decades are over. Some believe that in the end the great airships will best provide for long-distance voyages over the oceans and between the continents—especially between the several continents inhabited by the English-speaking communities. Mountain ranges and deserts have been crossed by aviators; little-known regions explored; historic and prehistoric sites alike surveyed from above. In the Old World and the New the aeroplane, already taken as a thing of course, has become the busy agent of passenger and packet traffic within nations and between them.

Air-craft are still but passing specks across the spaces of the sky, often not so conspicuous to an upward view as is a flight of birds. Far otherwise with things on the level. There, the dense increase of motor traffic by private cars, "taxis," and the bulkier public and commercial vehicles, has done more than any innovation for many centuries to alter the aspect both of crowded cities and of open roads, while accelerating the spirit of human movement and spreading manipulative skill. Wide economic interactions result. Motoring develops rubber production in the tropics, just as a hundred years ago

Lancashire manufacture and American cotton-growing were mutually impelled.

"Wireless" telegraphy and telephony were in their infancy when the last full reissue of the *Encyclopædia Britannica* was published in 1910. The former device now carries its invisible lines of communication round the globe—strongly stimulating, by competition, the transmitting capacity of cables. In mid-ocean it keeps ships, whether untroubled or imperilled, in touch with the shores or each other. World-telephony is beginning. It has happened to the present writer, expecting a London call, to find himself rung up for a quarter of an hour's conversation with Los Angeles over six thousand miles away. "Television" itself has become a real thing, starting modestly like all the other miracles of modern invention, but promising to reveal some day to each other faces and places at any distance apart. Will the time come ever, though far hence, when people anywhere without stirring shall be able to visit the National Gallery, the Prado, the Accademia, the Uffizi, the Louvre and the rest? Some experts say "Yes!" And who knows? Radio-broadcasting is now a universal addition to the conveniences. There seems no reason why London lovers of the Symphonies should not shortly listen at will to the Philadelphia Orchestra, or other music in America, as they do now to German performances, nor why American listeners-in should not simultaneously enjoy all the best music of Europe. "Loud speakers," again, as in the last great Presidential contest in the United States, carry one human voice to the simultaneous hearing of millions, and may so modify the effects of personality, by screening the orator's visible action from all but a fraction of his audience, that men of intellect, hitherto prevented from playing a due part in public life by the lack of what is called magnetism in countenance and gesture, may have a more equal opportunity with men of less able but more dramatic types. Thus, unless indeed this rational improvement be lost again by the perfecting of television, the working of free politics may be sensibly and wholesomely influenced.

We see ourselves at the outset of another potent agency—the creation of regional and national networks of electric supply whether generated by coal burned or by falling water. These volumes record the new researches looking to the conversion of crude coal, hitherto the most grossly misused mineral, into oil, and sundry chemical valuables, with a residual smokeless fuel. Success in this direction seems already fairly sure to attain that priceless gain to the comeliness and health of human conditions—a civilization industrialized and urbanized yet smokeless.

During these twenty years and more the lighter side of existence has seen a lively metamorphosis. All the associations belonging to the name of Hollywood have arisen. Throughout the world the picture-theatres are conspicuous. A more ubiquitous attraction than the living drama ever was, they entertain daily many millions of persons. They correspond with the play proper

much as newspapers of all sorts correspond with literature or at least with books. Motion pictures have become a world-institution like printing. Their invasion of Asia, for instance, is a striking aspect of the Oriental awakening. Added lately to the silent film is the talking picture. It may be that these devices, apt to become stereotyped by accelerated exhaustion of all the readier ingenuities, will find a truer artistic basis of their own. The gramophone in its crudity a trained ear could not endure; it has become an apparatus capable of bringing much nearer the finest execution of the best music.

III. More Light on Pre-History and Human Origins

FROM this latter scene of the novelties of the day, we come to a contrast amongst the most impressive. While mind stretches ever forward in understanding and invention, it reaches further and further backward in its knowledge of human beginnings. Archaeology strikes into deeper layers over wider areas; disentombs ages of history long buried and forgotten. We know more already of the remote origins of Eastern and Mediterranean civilization than was guessed by all the schools of antiquity at the zenith of their learning. Our knowledge is enriched rapidly with every season of research. We gain ever more light on early contacts of races, early working of metals, and the beginning of city-dwelling societies. As between pre-dynastic Egypt and Sumerian Mesopotamia, the long-debated question of civilizing priority remains an unsolved secret but becomes yet more fascinating as investigation on each side extends and descends. A common source may be found elsewhere. The first organized civilizations which flourished thousands of years ago ranged from the Aegean to China and Japan. The conjecture that India, after all, may have been the primal mother remains pure surmise; but the discoveries at Mohenjo-Daro, Harappa and other places in the Indus valley open up a new vista. Exploration in that quarter is only starting. In the far-removed field of Central America, the Maya problem becomes more baffling as we learn more.

Immeasurably further back go the enquiries into the means and the stages whereby man emerged a little from the brute, and rose afterwards out of a semi-brute state, continued through hundreds of thousands of years. The last two decades have told us much more of the Old Stone Age and the New Stone Age—the latter flowering so suddenly, as it will seem until we know more, into the fuller civilizations. Combining city-life with skilled agriculture, the men of a new day possessed religious systems and State-forms. Carrying the use of metals from copper-working to bronze-making, adept in pottery and textiles, they evolved from pictorial signs the art of writing and the power of record.

Anthropology overlaps archaeology. It is the study of man in a fuller sense—chiefly the study physical, mental and social of primitive man and of his surviving representatives. It considers more remote and more

recent evidence touching bodily traits, race and colour, tribal customs and sex laws, religious gropings, typical implements and the rest. Rarely can anthropology make spectacular additions to its material data. Its landmarks, rather, are books like Sir James Frazer's, throwing a flood of new light upon the meaning of assembled evidence. But in the last twenty years, special investigation in many regions has resulted in far fuller acquaintance with the outwardness and inwardness of separated primitive cultures. As a result, almost needless to say, theoretical contests respecting evolution and distribution have not been composed but accentuated.

Two illustrations may be given of the present contrast between the length of the past and our inklings of the future. Sir Arthur Keith compares the lessons of various discoveries all made well within the last two decades. He concludes that man began to appear "certainly a million years ago, perhaps more." And this is a very short term relatively to his Earth's antecedents. Man is a biological novelty—like death. Here the special study of his origins and experiences links up with all the sciences. Sir J. H. Jeans has remarked: "While the geologist has been increasing his estimate of the Earth's age up to 1,400,000,000 years or more, astronomical research has been moving in the direction of asking for at least a thousand times this period for the sun and the stars in general." Since then he concludes "all available lines of evidence agree in assigning lives of the order of millions of millions of years to the stars."

IV. "Recorded" History

WHAT we call recorded history is thus but a brief trifle beside the time-conceptions of the astronomer, the geologist and the biologist. Yet history proper is of paramount value as an account, both stirring and warning, of human personality and human movements, of interrupting disasters and resumed creativeness, during those five or six thousand years in which the play of motive and ideas has been of a kind that admits of our own intimate comprehension and even assists our own experience. Ancient Egypt and Babylonia, for instance, are by no means irrelevant to the student and administrator to-day in the same regions and in India. In history proper, whether called ancient, mediaeval or modern—though all of it is so modern by comparison with the scientist's measures of time—we have had no single book in the twentieth century equal in lasting mastery to Gibbon's *Decline and Fall*, or to Ranke's *Popes* or to Mommsen's *Roman Provinces*, or to Fustel de Coulanges in *La Cité Antique*. Yet the twenty years have been full of searching work throwing new rays into every field of historical study. The mass of available information has been much enlarged by publication of original records, by detailed monographs, by studies scattered through periodicals. Few subjects could now be approached from the same standpoint as the more eminent minds might have taken twenty years ago.

V. The World War and a Complex of Revolutions

THIS general change of mood in viewing history is largely due also to the unparalleled catastrophe which swept civilization soon after the Eleventh Edition appeared. The interval is like an abyss between two political epochs. A rending convulsion continues its influence upon the circumstances and the thought of mankind. The World War is properly named. It involved the whole world directly or indirectly. The formal neutrals were a small fraction. European strife was imminently threatened by events in the Balkans in the very year after the *Encyclopædia Britannica* of the former epoch came out complete at the beginning of 1911. The general conflict of nations broke out in the summer of 1914 and lasted into November 1918.

The first years of nominal peace continued the abnormal course of events. Into less than a decade was crowded, as never before, tumult and revolution enough for an average century or more. In Europe, one ancient and spacious Empire disappeared; three great Imperial dynasties and a number of sub-dynasties vanished from their thrones; races long subjected, and in several cases dismembered as well, were reconstituted as independent peoples; defeated Germany became a Republic; Bolshevik fanaticism, seeking the utter extinction of private property and social privilege, swept Russia like a fire. Elsewhere with boundless audacity, like the first Napoleon, a young dictator seized and still retains the control of Greater Italy. Spain, Poland, Lithuania, Yugoslavia, Chile, Turkey, Persia and some other countries are under the essentially military rule of persons or camarillas. In Turkey, a fighting dictator of iron stamp defied the decrees and broke the efforts of the victorious Allies. He then rooted out national customs and institutions hitherto sacred to conservative Islam.

The vibrations went through all Asia. In India, the former stability of a British régime conducted in the spirit of beneficent despotism was replaced by all the hopes and hazards connected with a scheme of gradually enlarging self-government for a sub-continent containing several hundred millions of people divided as nowhere else by region, religion, language, race, caste, class; and including, under British suzerainty, many native monarchies, principalities and chieftaincies by no means firmly converted to the democratic principle. In a still larger and more populous part of Asia, the Chinese Republic was nominally established in 1911, well before the World War. But that eruption had the effect of aggravating in China chaotic struggles brought only of late to a partial settlement between the domestic factions. The ascendancy of the general spirit of Chinese nationalism is, however, unquestioned and has secured from most foreign nations recognition sufficient to guarantee that this new freedom in external relations will not be reversed, whatever form the internal Government may take. This situation was not so difficult for any other country as for Japan—raised by the World

War to still higher political and commercial position among the Great Powers, but more than ever dependent on trade with the Asiatic mainland; and regarding with very intelligible anxiety the possible consequences of Chinese consolidation and protectionist tariffs.

VI. A New Era in the English-Speaking World

WORKING as deeply for change, though in ways as yet less apparent, have been the results of the European cataclysm upon the English-speaking world. Such of these effects as concern the movement for world-peace and the political emancipation of women will be better taken in a later connection. There are other consequences of outstanding historical importance. Drawn late into the World War, the United States finally determined its issue as against the Central Empires, and emerged with a relative strength and wealth not attained nor approached before by any one country. The separate sea-supremacy of Britain ceased to be. Its increasing completeness, during two centuries and a half since Cromwell, had sheltered at first the rise of English-speaking America itself, and had been the decisive influence on world affairs. At the Washington Conference of 1921-22, Britain and the United States agreed that naval parity between them should be the principle of the future. In the entire period covered by this retrospect no single historic change was of more far-reaching significance.

Political relations within the British Empire itself were transformed in theory but not as much in reality—except in one respect. The larger part of Ireland, after a violent guerrilla, was recognized as the Irish Free State, wholly exempt, like Canada and Australia, from direct British rule, but owing like them allegiance to the King. The other self-governing Dominions had been in fact, before the War, as free from compulsion by the mother country as they are now. The British system, so far as its English-speaking constituents were concerned, became an association of co-equal commonwealths regulating their mutual affairs by discussion at periodical Conferences. This is a unique experiment. The daring genius of modern British belief in voluntary partnership has been justified hitherto in repeated crises, while often centralized systems superficially more coherent have failed.

VII. "The Economic Age"

WE COME to the final part, but a very large part, of the resurvey undertaken by the makers of the Fourteenth Edition of the *Encyclopædia Britannica*. The department remaining to speak of is that of Economics. Expansion and intensity in this field are beyond anything known to the pre-war epoch. We have entered upon an age when economics, whether we wholly like it or not, are preponderant as never before in politics and in all existence. This sphere contains indeed the entire apparatus, human and mechanical, of production, transport and exchange. Economics are affected day by day not

only by every technical invention and by the progress of every applied science, but by every fluctuation of natural forces, every marked historical occurrence, every variation in political systems, every increase of insight gained through research into the psychology of human exertion; by every added instinct of democratic aspiration; every further admission of the claims of women; and even by every breath of fashion and by every fleeting movement of hope or fear amongst mankind. All the relations between employers and employed are involved; all theories of capitalism, socialism and of intermediate adjustments; all conceptions of aesthetics as applied to collective life; and all notable views of other sorts. Some of them are radically challenging to extreme industrialism and urbanization—rather regarding the use of life itself for the highest development of human faculty and happiness; enquiring keenly into what really constitutes "the greatest good of the greatest number."

Only a few salient features of the economic re-survey in the ensuing volumes can be indicated. Raw materials; processes of manufacture; engineering and machinery; power-generation; types of large scale organization in business—these had to be dealt with in the present undertaking far more variously than in any former Edition. Many new aspects of the relations between capital and labour are displayed. The new industries have their pages. Unemployment and migration in their later phases are dealt with as deeply altered problems. The economics of the World War demanded a long category of articles or additions bearing upon debts, reparations, the revolutions and restorations of currencies, upon banking, loans, tariffs. For in all these and other financial connections, the period since 1914 has been perhaps more surprising and instructive than the whole of former history.

A NEW SYSTEM OF ENCYCLOPAEDIA-MAKING

IT IS now easy to see why (in the judgment of the present writer) the circumstances required a bold departure from precedent and a fundamental change in the method of encyclopaedia-making. No one living person and no central staff can now pretend for a moment to draw out in the old way a sort of Mercator's projection of contemporary knowledge with its major and minor configurations and boundaries; with its "filling in" of details, multitudinous themselves, yet selected from the innumerable. We have in our day many-volumed compilations for separate branches of knowledge, but as they show by the reference to their sources, none of them affects to be exhaustive even in their special kinds. An encyclopaedia, proper and general, must seek to give much about every principal subject, something essential about other subjects, under tens of thousands of headings; but by no possibility, though it ran into thousands of volumes, could it contain everything about everything. Were that monstrous work within the dull power of misdirected

human effort, it would, of course, frustrate the purpose. No one could use it much, few could use it at all. The office of the *Encyclopædia Britannica* is to provide the fullest, most various digest of universal information in its articles—and its bibliographies are a guide to the rest.

The Eleventh Edition, then, could not be taken as a basis for rebuilding. An entirely new edifice was needed, starting from a new ground plan. The main proportions and measurements, external and internal, of a fresh design were soonest settled. Division of space to accommodate the competing needs of so many departments exacted, as we have seen, more prolonged consideration at the outset and much reconsideration afterwards. But when this too was determined only structural questions were settled. The vital problems remained—how to equip each department for organizing the best presentment of its own kind of information.

It was decided to abandon the tradition of wholly centralized government and to institute instead what may be called a federal system of co-operation. With due care for unifying the results of so many different responsibilities, the principle of autonomous organization was applied simultaneously to the great provinces. A corps of Associate Editors was formed, each an expert of recognized eminence. In addition, competent assistants were appointed for each of the many groups which in the schedules of modern encyclopædia-planning are called intermediate or miscellaneous. The various functions were undertaken ultimately as follows:

CAPTAIN E. ALTHAM	NAVAL
<i>Secretary, Editor and Chief Executive Officer, Royal United Service Institution.</i>	
EDWARD N. DA C. ANDRADE	PHYSICS
<i>Quain Professor of Physics, University of London.</i>	
SIR T. W. ARNOLD	MOHAMMEDANISM
<i>Professor of Arabic, University of London.</i>	
JOSEPH BARCROFT	PHYSIOLOGY
<i>Professor of Physiology, Cambridge.</i>	
VERNON H. BLACKMAN	BOTANY
<i>Professor of Plant Physiology and Pathology, Imperial College of Science and Technology, London.</i>	
REVEREND J. S. BOYS-SMITH	CHRISTIANITY
<i>Fellow, St. John's College, Cambridge.</i>	
DR. CLOUDESLEY BRERETON	EDUCATION
<i>Late Divisional Inspector for Modern Languages to the London County Council.</i>	
MARGARET BRYANT	BIOGRAPHY
DR. S. A. COOK	RELIGION (Old Testament History)
<i>Lecturer in Hebrew and Aramaic, Cambridge.</i>	
The late SIR THEODORE COOK	SPORTS AND GAMES
<i>Formerly Editor of The Field.</i>	

HARVEY WILEY CORBETT	ARCHITECTURE
<i>Architect of Bush Terminal, New York, and Bush House, London.</i>	
WARREN E. COX	ART
A. S. EDDINGTON	ASTRONOMY
<i>Plumian Professor of Astronomy; Director of the Observatory, Cambridge.</i>	
H. J. FLEURE	GEOGRAPHY
<i>Professor of Geography and Anthropology, University College of Wales.</i>	
T. C. HODSON	ANTHROPOLOGY, ARCHAEOLOGY AND PHILOLOGY
<i>Reader in Ethnology, University of Cambridge.</i>	
JULIAN HUXLEY	BIOLOGY AND ZOOLOGY
<i>Fullerian Professor of Physiology in the Royal Institution.</i>	
DR. W. S. LAZARUS-BARLOW	MEDICINE
<i>Formerly Professor of Experimental Pathology, Middlesex Hospital Medical School, University of London.</i>	
CAPTAIN B. H. LIDDELL HART	MILITARY AND AIR
<i>Military Historian and Critic.</i>	
H. M. J. LOEWE	JUDAISM
<i>University Lecturer in Rabbinic Hebrew, Oxford University.</i>	
ROBERT LYND	LITERATURE AND DRAMA
C. A. MACARTNEY	HISTORY (NEAR EAST)
<i>H.B.M. Acting Consul for Austria, 1921-26. Intelligence Officer, League of Nations Union, 1928.</i>	
DR. S. H. MELLONE	CHRISTIAN CHURCHES
<i>Lecturer, Manchester College, Oxford; formerly Lecturer, Manchester University.</i>	
SIR L. CHIOZZA MONEY	ECONOMICS AND INDUSTRY
<i>Parliamentary Secretary to the Ministry of Shipping, 1916-18.</i>	
G. T. MORGAN	CHEMISTRY
<i>Director, Chemical Research Laboratory, Department of Scientific and Industrial Research.</i>	
J. H. MORGAN, K.C.	LAW
<i>Professor of Constitutional Law, University of London.</i>	
DR. R. H. RASTALL	GEOLOGY
<i>University Lecturer, Economic Geology, Cambridge.</i>	
DAVID E. SMITH	MATHEMATICS
<i>Professor Emeritus of Mathematics, Teachers College, Columbia University.</i>	
F. M. STENTON	HISTORY (MEDIÆVAL)
<i>Professor of History, University of Reading.</i>	
DR. D. F. TOVEY	MUSIC
<i>Reid Professor of Music in the University of Edinburgh.</i>	
ABRAHAM WOLF	PHILOSOPHY AND PSYCHOLOGY
<i>Professor of Logic and Scientific Method, University of London.</i>	

As Co-editor of the whole work, Mr. Franklin H. Hooper, the head of the New York office, has been the invaluable colleague of the Editor-in-Chief, and, in addition, has been exclusively responsible for American contributions. Mr. Warren E. Cox, the Art Director, has been responsible for the illustrations as well as the articles on art. Mr. Hooper found it necessary to secure the aid of a corps of associates, each an expert of recognized eminence. Their names and functions follow:

DR. ISAAH BOWMAN	GEOGRAPHY
<i>Director of the American Geographical Society.</i>	
CHARLES R. BROWN	RELIGION
<i>Dean of the Divinity School, Yale University.</i>	
HENRY SEIDEL CANBY	LITERATURE
<i>Editor of the Saturday Review of Literature.</i>	
JOHN R. COMMONS	ECONOMICS
<i>Professor of Economics, University of Wisconsin.</i>	
DR. WILLIAM CROCKER	BOTANY
<i>Director of the Boyce Thompson Institute for Plant Research.</i>	
JOHN DEWEY	PHILOSOPHY
<i>Professor of Philosophy, Columbia University.</i>	
FRANK B. JEWETT	INDUSTRY AND ENGINEERING
<i>Vice-President, American Telephone and Telegraph Company.</i>	
CHARLES H. JUDD	EDUCATION
<i>Director, School of Education, University of Chicago.</i>	
VERNON L. KELLOGG	BIOLOGY (SCIENCE, EDUCATION)
<i>Of the National Research Council, Washington.</i>	
MARION E. PARK	WOMEN'S ACTIVITIES
<i>President of Bryn Mawr College.</i>	
RAYMOND PEARL	BIOLOGY
<i>Professor of Biology, Johns Hopkins University.</i>	
ROSCOE POUND	LAW
<i>Dean of the Law School, Harvard University.</i>	
HELEN ROGERS REID	WOMEN'S ACTIVITIES
<i>Of the Herald Tribune, New York.</i>	
SAMUEL W. REYBURN	MERCHANDISING
<i>President, Lord and Taylor, Inc., New York.</i>	
GRANTLAND RICE	SPORTS
<i>Of the Herald Tribune, New York.</i>	
JAMES HARVEY ROBINSON	HISTORY AND CULTURES
<i>Formerly Professor of History, Columbia University, New York.</i>	
ADMIRAL W. L. RODGERS	NAVAL AFFAIRS
<i>Of the United States Navy.</i>	
CHARLES H. SABIN	BANKING AND FINANCE
<i>Chairman of the Board, Guaranty Trust Company, New York.</i>	

ELMER A. SPERRY ENGINEERING AND INDUSTRIAL RESEARCH
Chairman of the Board, Sperry Gyroscope Company.

CLARENCE G. STOLL ELECTRICAL INDUSTRIES
Vice President, Western Electric Company.

DEEMS TAYLOR MUSIC
Editor of Musical America.

E. R. WEIDLEIN INDUSTRY AND ENGINEERING
Director, Mellon Institute of Industrial Research, Pittsburgh.

FRANK C. WHITMORE CHEMISTRY
Chairman, Division of Chemistry, National Research Council, Washington.

C. C. WILLIAMSON LIBRARY AND REFERENCE PRACTICE
Director of Libraries, Columbia University.

The co-ordinating work was executed by the central staffs in London and New York. In the London Office Mr. E. Ibbetson James was first lieutenant, Mr. R. W. Postgate gave special attention to the classical side, Mr. V. C. Clinton Baddeley to modern history, while Dr. Neville Whymant's personal acquaintance with lands and languages in the Far East was an exceptional reinforcement. On the organizing and administrative side, it is not easy to imagine duties more arduous, nor services more efficient than those of Mrs. G. E. Law and Miss Marjorie Hollowell.

In the New York Office, Dr. Walter B. Pitkin for the first year was first lieutenant; in the second year, Mr. Charles Johnston aided by general suggestion and in reading proofs; Mr. Frank W. Johnson in biology; and Mr. William H. Turner's services in economics and applied science were a great help to the Editors and to the usefulness of the work. To Mrs. L. P. Dudley, especially, the thanks of the American Editor are due for her highly capable services in organizing the administrative side of the New York Office.

Thousands of contributions, large and small, come under categories which no list like the above can include. In this connection many experts were consulted upon the preparation or revision of single articles and groups of articles, and thanks are due to numerous associations, libraries, universities, corporations and government departments for substantial aid or advice given to editors and contributors.

As this method of working marks a distinctive development in the methods of encyclopaedia-making, some words concerning it must be added here as part of the records of the *Encyclopædia Britannica*. Each Associate Editor made a separate survey of the area for which he was responsible; divided up that area according to his own judgment of modern requirements; and drew up a schedule of articles and writers. At headquarters these schedules were compared and a final disposition of the space available within the twenty-four volumes of about a thousand pages each

was made on paper. Needless to say, this finality in theory was subject to endless rearrangements in practice. Encyclopaedia-making is an organic process defying anything like exact mechanical regulation in advance. Nor in the full course and final stages of the work can its adjustments be made according to the old farmer's idea of verse as done "with a gauge and a chopper to measure the length of the lines." Labours such as these volumes represent are a human, indeed an extremely human, affair, involving as they do collaboration, visible and invisible, between a host of personalities rightly swayed at the outset by incompatible convictions about the relative importance of their subjects. The theme usually grows under the hand of an expert settling down to it. The allotted room is frequently exceeded, yet without waste of a word. Cogent always are the arguments in favour of compressing almost any valuable contribution except the one in question which perforce must be compressed if any assigned number of volumes is not to grow inordinately beyond the plan. But conflicting claims of this unavoidable kind, continually arising from beginning to end, and creating formidable hitches now and again, are always settled at last by the good humour of collegueship, and the reasonable recognition of necessity.

SCIENCE: AUTHORITY AND SIMPLIFICATION

A PROMINENT purpose in distributing responsibilities amongst the Associate Editors for the scientific departments was to secure as far as possible a more simplified exposition of the sciences. This aim, to a remarkable degree, has been happily achieved; it could not be carried further at this period of civilization—terminology, formulas and the diagrammatic apparatus being what they are—without reducing the *Encyclopædia Britannica*, in this very large and ever-growing area of its task, to an elementary level. We all are apt to ask at some time why the treatment of science cannot be made throughout as generally intelligible to the ordinary educated person as the articles on history or literature. The suggestion is at first sight very persuasive. When well looked into, it is found practicable up to a certain point, but beyond that encounters insuperable obstacles. Each science expressing itself in any language has, as it were, a sub-language, an alphabet, and a grammar of its own. A general encyclopaedia cannot teach these any more than it can teach Latin or Greek, French or German. You cannot begin to understand mathematics without learning the rudiments; nor chemistry, by way of ready reference to pages like these, without some antecedent grip of the clear rationale of its formulas; nor biology without some preliminary acquaintance with its elements and its vocabulary. It is impossible to make any science as readable as history for a general reader who never has received a lesson in science, nor has read any ordinary text-book.

But much has been done. In the Fourteenth Edition the history of each science has been written in plainer language; the further exposition has been relieved from superfluous complication. It was said of an article in a former Edition of the *Encyclopædia Britannica* that when it had been written by one profound *savant* there was only one other in the world who could understand it. By contrast, the sciences in these new volumes are dealt with in a manner that makes them accessible to general readers. With good attention, the clue to the meaning and importance of leading ideas can be gained by lively-minded readers uninstructed in the detail of any science. This is eminently the case, for example, in the articles treating of the nature and properties of the atom; and also in the general (and many subsidiary) articles on astronomy, geology, physics and biology, to mention only these. They may well lead many minds to that fullest awakening of imagination which even literary genius cannot by itself rouse. In 1915 a young soldier was killed on the Gallipoli peninsula at the age of 28, but not before he had won an immortal name by detecting in the relationships of the elements as they increase in complexity a law of harmonic progression no less beautiful than enlightening. Professor Millikan does not necessarily say too much when he writes: "Some day a poet will arise who will make an epic for the ages out of young Moseley's discovery."

We must at least expel the mandarin-like fallacy which still lingers in too many minds—that the study of the sciences has no humanistic value. We may be certain that Plato and Lucretius with Dante, Milton and Goethe, could they bear witness together in our time, would protest to the contrary. Bacon by himself might be taken as sufficient witness. No true humanist can now suppose that gardens, mountains and stars are enriching influences; but not botany, nor geology nor astronomy. Mediaeval alchemy, and very rightly, is amongst the accepted romances of literary convention. But the actual chemistry and biochemistry of to-day are a thousand times more wonderful in their practice and not less so in their dreams.

EXPANSION AND CONDENSATION

THE more besetting business, when all else is said, was that of enlarging greatly the number and variety of the contributions, while making the whole work more compact than the Edition of 1910. The amount of pains expended by the editorial staffs in London and New York upon the solution of this difficulty does not lend itself to an easy description. The same problem always has been more or less incidental to every work of an encyclopaedic kind, purposing to be more modern and comprehensive than its predecessors. But the old difficulty increased to an unmatched degree in the making of the Fourteenth Edition of the *Encyclopædia Britannica*. The treatises or dissertations filling far-stretching expanses of print in every volume designed

twenty or fifty years ago could no longer be so numerous. Brevity to the utmost extent compatible with clearness and sufficiency had to be enforced. But at the same time, a full solution could not be obtained by any means so simple as reducing former subjects in unvarying proportion in order to make room for so many new ones. The *Encyclopædia Britannica* cannot become an encyclopaedic dictionary on the well-known German model, such as may well be compiled in half the number of volumes. It must provide, generally and throughout, more information under a given heading than any other work of universal reference; while on certain great matters old and new—notably in the spheres of history and literature—its now secular tradition of fullness and authority must be strongly maintained. Accordingly, many important articles remain of outstanding massiveness as before.

These are the equivalent of Leibnitz's approved "little books"—then, meaning not so little neither. But such instances of just and excellent amplitude only make more exacting the task of contriving such efficient economy and retrenchment elsewhere as might make place enough for thousands of new headings either required by the progress of knowledge and practice in the last twenty years, or recommended by the advisability, for modern convenience, of extricating many things formerly embedded in the long general articles. Relief fortunately offered itself in one respect. After the lapse of years much material which once had value in itself, or was prized for the sake of some eminent writer's name, was found to be dead wood and could be cut away. In the same manner, passages of disputable assertion or of moralization or large interrupting statements of fact could be excised not only without injury, but with profit. Biographies of persons who had but small importance in their day and have none in ours could be excluded altogether; while all biographies of secondary persons who remain interesting could be shortened without any loss of essentials. The space formerly given by Victorian habit to contemporary writers and politicians at home and abroad was usually far beyond historic proportion. In several cases what would once have been regarded as impiety or sacrilege has been committed in this Edition. For instance, Lord Macaulay's article on William Pitt has been replaced by a concise and dispassionate account. With all its gleaming rhetorical energy and abundant flow it was much disfigured by political prejudices then still surviving from the party heats of the previous generation; and as written in 1858, it has been displaced by later studies and more discriminating judgment. So, in other generations, Sir Walter Scott's article on the "Drama" was preserved through half a century untouched from one Edition to another in "homage due to the genius and fame of the illustrious author"; it was dropped at last from the Ninth Edition.

By themselves, however, the space-saving resorts

thus indicated were not nearly enough. Success in combining the two principal objects, increased comprehensiveness of scope and more concise management of subjects, was attained mainly through the skill of the Associate Editors in ordering their provinces, and through the willing acceptance of a hard discipline by their regiments of writers. Authorities not inferior in eminence to any who ever wrote for the *Encyclopædia Britannica* have handled some of the largest themes more succinctly yet more lucidly than the best of their predecessors.

CONTRIBUTIONS AND CONTRIBUTORS

APART from the editorial names already enumerated, over 3,000 contributors from all parts of the world have been enrolled. It is impossible to name all the articles and writers deserving "mention in despatches." But it is proper to show by some representative selection from these how much care has been taken during the construction of the Fourteenth Edition to maintain the *Encyclopædia Britannica's* highest traditions of scholarly authority while modernizing resolutely its scope and form. Let us take some groups of studies in their contrasts.

RELIGION. Amongst the contributions on the OLD TESTAMENT, DR. STANLEY ARTHUR COOK has written an account equally new and important of *Hebrew Religion* while bringing up to our day his other well-known work on *Palestine* and the earlier *Books*. Other collaborators in this department are DR. HENSLEY HENSON, Bishop of Durham, RT. REV. WM. T. MANNING, Bishop of New York, PROFESSOR W. E. BARNES (Cambridge), DR. SHAILER MATHEWS (University of Chicago), PROFESSOR G. H. BOX (London), PROFESSOR F. M. T. BÖHL (Leyden), DR. CHARLES R. BROWN (Yale University), PROFESSOR G. A. COOKE (Oxford), BISHOP FRANCIS J. MCCONNELL of the Methodist Episcopal Church in the United States, DR. A. E. COWLEY (Librarian of the Bodleian), MR. G. R. DRIVER, of Magdalen, PROFESSOR W. A. L. ELMSLIE (Cambridge), PROFESSOR A. S. PEAKE (Manchester), PRINCIPAL WHEELER ROBINSON, DR. PETER GUILDAY (Catholic University of America, Washington), PROFESSOR THEODORE ROBINSON (Cardiff), PROFESSOR D. C. SIMPSON (Oxford). Under auspices like these, all needed revision has been carried out; while among newly written articles are *Jehovah*, *Abraham*, *Job*, *Psalms*, *Proverbs*, *Isaiah*, *Jeremiah*.

Those who have written or rehandled other subjects of THEOLOGICAL HISTORY and CRITICISM include PROFESSOR F. C. BURKITT (Cambridge), PROFESSOR J. M. CREED (Cambridge), PROFESSOR E. HIRSCH (Göttingen), PROFESSOR HANS LIETZMANN (Berlin), PROFESSOR C. H. TURNER (Oxford). These treat of the New Testament and the Creeds. Studies of note, bearing on recent controversies are *Eucharist* and *Sacrament*, and *Fundamentalism* and *Modernism*, the latter by DR. W. ADAMS BROWN of the Union Theological Seminary,

New York. The article on *Jesus Christ* is by DR. ANDERSON SCOTT and DR. STANLEY ARTHUR COOK. *Religion* and *Theism* were undertaken, the former by PROFESSOR R. R. MARETT (Oxford) and PROFESSOR G. GALLOWAY (St. Andrews), the latter by PROFESSOR W. R. MATTHEWS (King's College). The article *Judaism* has been written by H. M. J. LOEWE, and the article *Jews* by H. M. J. LOEWE, S. A. COOK, L. H. D. BUXTON, CECIL ROTH and the CHIEF RABBI, J. H. HERTZ. Two articles retained though revised must be mentioned because of their authorship and excellence—*Gospel of John* by BARON FRIEDRICH VON HÜGEL and *Theosophy* by PROFESSOR A. S. PRINGLE-PATTISON. In SIR T. W. ARNOLD's department are all the articles relating to the religious life of Islam.

CLASSICS. Much work was done on this side by PROFESSOR A. W. MAIR before his tragic death. From his own hand is the general study *Classics*. The late DR. J. P. POSTGATE's well-known article on *Textual Criticism* has been revised by his son MR. R. W. POSTGATE.

HISTORY, of all things, was thought once to be outside the bounds of encyclopaedias (the *Encyclopédie* gives about one page to the heading *France* and one column to *Angleterre*). It now rightly occupies an immense proportion of their total space; so that amongst the crowd of eminent things in this part of the purview only a very few can be indicated. PROFESSOR F. LI. GRIFFITH has revised all the pages on *Ancient Egypt*. *Athens*, *Greece*, *Rome*, and *Carthage* respectively are written, wholly or in large part, by MR. A. J. B. WACE, PROFESSOR E. M. WALKER, PROFESSOR TENNEY FRANK and MONSIEUR JEAN BABELON of Paris. The great veteran PROFESSOR EDUARD MEYER has brought forward his previous articles, *Media*, *Persia*, *Parthia* amongst others. DR. THOMAS ASHBY has devoted himself to *Sicily* and *Syracuse*. Nor from the briefest selection can we omit DR. G. B. GRUNDY's re-study of the *Graeco-Persian Wars* or his *Economics of Greek History*. *Roman Britain* is in part by SIR GEORGE MACDONALD, chief specialist on the subject since the death of PROFESSOR HAVERFIELD.

PROFESSOR ERNEST BARKER's revision of his very full and celebrated article on the *Crusades* adds the last word to that large theme. PROFESSOR J. B. BURY before his lamented death completed with mastery his treatment of the *Later Roman Empire*. PROFESSOR H. M. CHADWICK of Cambridge writes *Anglo-Saxons*, a subsection in the article on *Britain*. To the irreplaceable treatise on the *Renaissance* by JOHN ADDINGTON SYMONDS, PROFESSOR PRESERVED SMITH of Cornell University adds a note. The series of articles on the history of the Papacy have been further strengthened, especially in those sections dealing with the last three centuries, not hitherto handled in a manner harmonious with the learned and living accounts of earlier periods by DUCHESNE, LUCHAIRE and VON PASTOR. Enough to say that the *Reformation* is in the hands of MR. G. G. COULTON.

To single out from amongst the long list of contributions and contributors on other, mostly more modern, aspects is the hardest. There are all the national histories. England in later centuries is dealt with by PROFESSOR F. C. MONTAGUE, SIR CHARLES GRANT ROBERTSON, DR. HOLLAND ROSE, MR. D. C. SOMERVELL for the Victorian age and MR. R. H. GRETTON for the twentieth century. No book yet published furnishes what will be found in MR. FRANK BIRCH's group of five articles on *The Cabinet*, *Prime Minister*, *Privy Council* and *Constitution of Great Britain*; and the *Court of High Commission*. Amongst constituent Dominions, *Canada* is by PROFESSOR G. M. WRONG of Toronto.

France is by MONSIEUR P. WIRIATH of Paris; *Germany* by PROFESSOR ERICH BRANDENBURG of Leipzig; *Spain* by DR. RAPHAEL ALTAMIRA and PROFESSOR S. DE MADARIAGA; *Russia* by the old cadet leader MR. PAUL MILIUKOV and by MR. MICHAEL FARBMAN (for 1917) and MR. WALTER DURANTY (since 1917); *Italy* largely by COMMENDATORE LUIGI VILLARI; and so onward. PROFESSOR CHARLES SEIGNOBOS handles *Europe*.

UNITED STATES HISTORY is treated in detail by PROFESSORS F. J. TURNER and ALBERT BUSHNELL HART of Harvard University, H. L. OSGOOD and D. S. MUZZEY of Columbia; *Constitution and Government* by PROFESSOR WALTER F. DODD of Yale; *Finances* by the HON. ANDREW W. MELLON, Secretary of the Treasury under three administrations; *Commerce and Manufactures* by DR. JULIUS KLEIN, Director of the U. S. Bureau of Foreign and Domestic Commerce, and the military effort of the United States in the World War by GENERAL PERSHING. But the United States is not simply a nation as is France or Italy; it is also a federal union of forty-eight "sovereign" States, varying in size from Texas, larger than the entire Japanese Empire, to Rhode Island, smaller than Cornwall; and in population from New York, with more inhabitants than Holland and Switzerland combined, to Nevada with a population one-third of Luxembourg's. The story of each of these States is told, some by their Governors, as *New York* by ALFRED E. SMITH, *Maryland* by ALBERT C. RITCHIE, *Ohio* by A. V. DONAHEY and *Virginia* by HARRY F. BYRD; others by one of their United States Senators, as *Idaho* by the HON. WILLIAM E. BORAH, *Montana* by the HON. THOMAS J. WALSH, *New Hampshire* by the HON. H. W. KEYES, and *Kansas* by the HON. ARTHUR CAPPER; some by writers who are accepted authorities on the history of their States, as JAMES TRUSLOW ADAMS for *Massachusetts*, PROFESSOR CHARLES E. CHAPMAN for *California*, PRESIDENT KENNETH C. M. SILLS for *Maine*, PROFESSOR D. D. WALLACE for *South Carolina*, DR. DAVID KINLEY, President of the University of Illinois for *Illinois*—in all a company of forty-eight scholars and men of affairs well able to reinforce the *Encyclopædia Britannica*.

For Latin America, PROFESSOR C. W. HACKETT contributes the history of *Mexico*; PROFESSOR PERCY MARTIN, *Brazil*; PROFESSOR MARK JEFFERSON, *Argentina*; PROFESSOR ISAAC COX, *Chile*; and MRS. M. T. BINGHAM, *Peru*.

A sad interest attaches to the article on the *Panama Canal*, for its builder, GENERAL GOETHALS, wrote part of it on his deathbed, and the Secretary of the Panama Commission, MR. JOSEPH B. BISHOP, died shortly after completing it.

On Asiatic themes, taking them in order from Near East to Far East, we have *Turkey* by DR. ADNAN and MADAME ADNAN of Constantinople; *Syria and Zionism* by MR. LEONARD STEIN; *Palestine* by SIR RONALD STORRS, former Governor of Jerusalem and now Governor of Cyprus; *Arabia and Trans-Jordan* by MR. H. ST. JOHN PHILBY; *Persia* by SIR PERCY SYKES, SIR PERCY COX and SIR ARNOLD WILSON; *Iraq* by SIR PERCY COX; *Afghanistan* by SIR WOLSELEY HAIG; *India* by LORD MESTON; *Ceylon and Malaya* by SIR HUGH CLIFFORD; *Tibet* by SIR CHARLES BELL; *China* by PROFESSOR KENNETH SCOTT LATOURETTE; and *Japan* by SIR CHAS. ELIOT, "Odysseus" in literature, and for seven years up to 1926 British Ambassador to Tokyo. Amongst articles relating to another Continent, Africa, MR. FRANK R. CANA, to whose long services the *Encyclopædia Britannica* is uncommonly indebted, has written many. *Egypt* has been entrusted to LORD MESTON. *Morocco* is by MONSIEUR HENRI BRENIER; *Algeria* by PROFESSOR AUGUSTIN BERNARD; *Abyssinia* in part by MR. C. F. REY, who writes from personal knowledge; the *Congo State* by MR. CANA; *Nigeria, Rhodesia and Cape Colony* by MR. BASIL WORSFOLD; *South Africa* by MR. BASIL WILLIAMS. We pass across the Indian Ocean to *Australia* and thence to *New Zealand*. Their annals are narrated by PROFESSOR DARNLEY NAYLOR and MR. PEMBER REEVES.

Various articles of mark cannot be classified under the usual periodical divisions of history. *Civilization* by PROFESSOR JAMES HARVEY ROBINSON is amongst the most meditative and suggestive work in these volumes. Imperial dynasties, vanished from their thrones since the Eleventh Edition of this Encyclopædia appeared, Habsburgs, Hohenzollerns and Romanoffs—find their chroniclers and critics in MR. C. A. MACARTNEY, HERR EMIL LUDWIG and MONSIEUR PALEOLOGUE. PROFESSOR ALISON PHILLIPS has been, as formerly, one of the mainstays of the general work on the modern historical side.

Finally, the organization of the treatment of post-war history required exceptional pains and care. SIR ARTHUR SALTER and LORD CECIL contribute on the *League of Nations*; MR. ELIHU ROOT (American Secretary of State from 1905 to 1909) treats of the *Permanent Court of International Justice*, so largely his own creation; MR. CHARLES E. HUGHES, Secretary of State from 1921 to 1925, of the *Monroe Doctrine*; his successor, MR. FRANK B. KELLOGG (1925 to 1929), of

Outlawry of War; MONSIEUR JULES CAMBON of *Security*. PROFESSOR NOEL BAKER takes *Disarmament and Sanctions and Guarantees*; DR. FRIDTJOF NANSEN, *Refugees and the Exchange of Populations*; SEÑOR P. DE AZCARATE Y FLORES, *Minorities*; MONSIEUR ALBERT THOMAS, the *International Labour Organization* which he directs; COLONEL HOUSE, the *Conference of Paris*; MR. GLASGOW, *Locarno*; DR. MORITZ BONN, the *Rhineland and the Ruhr* and PROFESSOR CHARLES SEYMOUR, the *Washington Conference*. *War-Guilt* is the theme of a trilogy by MONSIEUR PIERRE RENOUVIN for the most careful French view, by DR. HERMANN LUTZ for the German, and by the present writer, who gives another reading of historic forces and human psychology. The Editor-in-Chief has also written the new article on a subject not before viewed in connection—the *English-Speaking World*; its growth from small beginnings to its present magnitude, and the dominant question of its future inter-relations.

AVIATION, civil and military, is over-soaring, we may say, amongst all the practical subjects revolutionized since this twentieth century was in its infancy. We have the contributions of AIR VICE MARSHAL SIR SEFTON BRANCKER on *Civil Aviation*, AIR VICE MARSHAL SIR ROBERT BROOKE-POPHAM on *Air Warfare*, MR. D. R. PYE and DR. ELMER A. SPERRY on *Aero Engines*, MR. A. P. ROWE on *Aerial Navigation*, SIR R. T. GLAZEBROOK on *Aeronautics*, COMMANDER C. D. BURNEY on *Airship*, LT. COL. I. A. E. EDWARDS on *Air Routes*. The life and experiments of *Wilbur Wright* are told by his brother ORVILLE WRIGHT.

NAVAL. This sphere includes *Sea Power*, *Naval Strategy and Tactics*, and the *Battle of Jutland* by CAPTAIN E. ALTHAM (Associate Editor); REAR ADMIRAL J. E. T. HARPER writes on *Navigation*; PROFESSOR GEOFFREY CALLENDER, the famous sea battles in history; SIR WILLIAM J. BERRY contributes on ship construction; CAPTAIN S. T. H. WILSON writes *World War (Naval)*; CAPTAIN ALTHAM and MR. FRANK BOWEN (Editor of "Merchant Ships of the World") collaborate on the *History of Ships*; VICE-ADMIRAL R. N. BAX writes on *Submarine Campaigns*; COMMANDER J. C. MATHESON on the technical aspects of *Coast Defence*; CAPTAIN A. H. WALKER on *Mines, Minelaying and Mine-sweeping*. REAR-ADMIRALS WM. L. RODGERS and CHARLES F. HUGHES of the United States Navy have contributed articles and given much aid in American naval matters.

MILITARY. The new series of articles, necessarily very numerous, on Military History to the end of the World War, and on post-war developments have been brought together under the supervision of the Associate Editor in this province, CAPTAIN B. H. LIDDELL HART, who himself writes the articles *World War* and *Strategy*. His collaborators include the late MARSHAL FOCH (*Army: Morale in War*), GENERAL JOHN J. PERSHING (*United States: American Expeditionary Force*), BRIG.-GEN. SIR JAMES EDMONDS (*Battle of the Marne*), SIR

JOHN FORTESCUE, BRIGADIER-GENERAL H. A. DRUM, COLONEL FULLER, MAJOR-GENERAL EDGAR JADWIN, Chief of Engineers, U.S.A., DR. G. B. GRUNDY (*Graeco-Persian Wars*), COLONEL T. E. LAWRENCE (*Guerrilla Warfare*), LT.-COL. G. LEQ. MARTEL (*Tanks*), SIR CHARLES OMAN (*The Hundred Years' War*), GENERAL SERRIGNY (*France: Defence*), PROFESSOR SPENSER WILKINSON (*War*); PROFESSOR C. H. VAN TYNE (*American Revolution*), and MR. W. B. WOOD, chosen to write on the *American Civil War* because of the succinct ability of his previous work on the subject.

ARCHAEOLOGY AND ANTHROPOLOGY. MR. T. C. HODSON, Reader in Ethnology, University of Cambridge, Associate Editor for these subjects, has introduced a more thorough system of classification and presentation. Apart from early Egypt, already mentioned in connection with the name of PROFESSOR F. LI. GRIFFITH, *Aegean Civilization* and *Prehistoric Greece* are undertaken by MR. A. J. B. WACE; *North-west Africa* and *Crete* by MR. E. J. FORSDYKE; the *Hittites* by PROFESSOR HROZNY of Prague; *Central Asia* by PROFESSOR ALBERT VON LE COQ; *North America* and *Cliff Dwellings* by F. W. HODGE of the Museum of the American Indian. *Anthropology* in general is treated by PROFESSOR R. R. MARETT; special aspects by PROFESSORS C. G. SELIGMAN and MALINOWSKI (who writes on *Marriage*); *Evolution of Man* by SIR ARTHUR KEITH; *Races of Mankind* by MR. L. H. DUDLEY BUXTON; while PROFESSOR WESTERMARCK discusses *Polygyny*, *Polyandry* and related matters.

In BIOGRAPHY many of the greatest lives in all ages are related afresh by a group of collaborators particularly apt and distinguished. PROFESSOR BREASTED portrays that first historic personality to whom we feel ourselves close, *Ikhnaton* of Egypt. PROFESSOR A. E. TAYLOR re-studies *Socrates* and *Plato*; PROFESSOR ERNEST BARKER, *Aristotle*; PROFESSOR GILBERT MURRAY, *Homer* and *Euripides*. *Horace* was undertaken by MR. E. V. KNOX; *Hannibal* by PROFESSOR GAETANO DE SANCTIS of Florence; *Plotinus* by DEAN INGE; *Charles the Great* by the late PROFESSOR H. W. C. DAVIS; *Joan of Arc* by MONSIEUR PIERRE CHAMPION; *Luther* by PROFESSOR MACKINNON of Edinburgh; *Bacon* by DR. CHARLES SINGER; *Spinoza* by PROFESSOR A. WOLF. SIR STANLEY LEATHES was persuaded to undertake *Cromwell*, with the desired result. For France, MONSIEUR EDOUARD HERRIOT depicts *Danton*; and the Editor-in-Chief felt himself fortunate in obtaining *Napoleon* from the pen of MONSIEUR JACQUES BAINVILLE. PROFESSOR ERICH BRANDENBURG consented to furnish the biographies of *Bismarck*, *Bülow* and *William II*. LADY GWENDOLEN CECIL writes on her father, the late *Lord Salisbury*; LORD ESHER on *Edward VII.*, and MR. ST. JOHN PHILBY on *Ibn Sa'ud*, now nearly overlord of all Arabia.

As for modern literary names *Boswell*—always a modern—is by one very well acquainted with him, MR. S. C. ROBERTS; PROFESSOR H. W. GARROD has written

anew on *Wordsworth*; *Dickens* is by MR. G. K. CHESTERTON; *Blake* by MR. GEOFFREY KEYNES; *Victor Hugo* by MR. HAROLD NICOLSON; *Dostoevsky* and *Tolstoy* by PRINCE MIRSKY. Many biographies not entirely rewritten are renewed. Amongst these revisions are *Alexander the Great* by MR. EDWYN BEVAN; *Caesar* by PROFESSOR HENRY STUART JONES; *Dante* by PROFESSOR E. G. GARDNER; *Chaucer* by PROFESSOR A. W. POLLARD; *Shakespeare* by SIR E. K. CHAMBERS; *Goethe* by PROFESSOR JOHN G. ROBERTSON; *Pepys* by DR. J. R. TANNER; *Shelley* by MR. ROGER INGPEN; *Bernard Shaw* by MR. ST. JOHN ERVINE; *Thomas Hardy* by PROFESSOR LASCELLES ABERCROMBIE.

Amongst the American biographies are: *George Washington* by MR. ALLAN NEVINS; *Benjamin Franklin* by PROFESSOR BERNARD FAY; *Alexander Hamilton* and *Thomas Jefferson* by PROFESSOR FRANCIS S. PHILBRICK; *Edgar Allan Poe* by PROFESSOR CHARLES CESTRE of the University of Paris; *Daniel Webster* by GAMALIEL BRADFORD; *Nathaniel Hawthorne* by PROFESSOR VERNON L. PARRINGTON; *Abraham Lincoln* by PROFESSOR N. W. STEPHENSON; *Cardinal Gibbons* by the REV. FRANCIS DUFFY; *Admiral Peary* by COMMANDER RICHARD E. BYRD; *Walt Whitman* by EMORY HOLLOWAY; *Ralph Waldo Emerson* by DR. HENRY VAN DYKE; *Admiral Farragut* by REAR ADMIRAL W. L. RODGERS; *Edwin Booth* by WALTER HAMPDEN; *Theodore Roosevelt* by HERMANN HAGEDORN; *Woodrow Wilson* and *Calvin Coolidge* by PROFESSOR CHARLES SEYMOUR; *Thomas A. Edison* by DR. E. E. SLOSSON; and *Charles Dawes* by OWEN D. YOUNG.

LITERATURE AND DRAMA. Articles upon nations ancient and modern include, of course, studies of their literary history. Some outstanding biographies in this connection have been already mentioned. MR. ROBERT LYND is the Associate Editor, and amongst his corps are PROFESSOR GILBERT MURRAY, writing on *Greek Drama*; MR. STEPHEN GASELEE on *Mediaeval Latin Literature*—a new subject in the *Encyclopædia Britannica*; MR. J. C. SQUIRE on *Modern English Literature*; PROF. VERNON L. PARRINGTON and DR. HENRY SEIDEL CANBY on *American Literature*; MR. J. B. PRIESTLEY on *The Romantic Period in English Literature*; MR. HUMBERT WOLFE on *Modern Developments in English Poetry*; MR. LOUIS UNTERMAYER on *Modern Developments in American Poetry*; PROFESSOR GEORGE SAINTSBURY on *Romance*; MR. G. K. CHESTERTON on *Humour*, and MR. STEPHEN LEACOCK on *American Humour*; MR. ARUNDEL ESDAILE, DR. E. A. BAKER, and DR. CHARLES C. WILLIAMSON on *Libraries*, and SIR ROBERT DONALD and MR. JAMES MELVIN LEE on *Newspapers*. The *Novel* is by the late SIR EDMUND GOSSE, as is also *Biography*, to which MR. GEORGE SAMPSON has added a word on modern aspects. *Ballad* is by PROFESSOR GREGORY SMITH; *Parody* and *Limericks* by MR. E. V. KNOX. MR. IVOR BROWN gives a fresh view of *Modern Drama*. DR. LION FEUCHTWANGER, a strong accession to our ranks, deals with *Modern*

Developments of the Novel. Other foreign colleagues are PROFESSOR DENIS SAURAT, PROFESSOR CESARE FOLIGNO, PRINCE DMITRI MIRSKY, PROFESSOR ROMAN DYBOSKI, who write respectively on the literatures of France, Italy, Russia and Poland; while the article on *Rumanian Literature* has been recast by PRINCE ANTOINE BIBESCO and that on *German Literature* by PROFESSOR J. G. ROBERTSON.

ART AND MUSIC. MR. ROGER FRY writes on *Cézanne*, that pathbreaking painter who, curious to say, received no biographical treatment in the Eleventh Edition, and though he died in 1906 has not been till now adequately noticed in any encyclopaedia. The comprehensive section of the main article *Painting* which treats of *Modern Painting* is written by J. B. MANSON (of the Tate Gallery); *Drypoint* by MR. MUIRHEAD BONE; *Greek Art* by PROFESSOR PERCY GARDNER; *Roman Art* by MRS. STRONG; *Mural Painting* by MR. FRANK BRANGWYN; *Chinese Painting* and *Japanese Painting and Prints* by MR. LAURENCE BINYON; *European Pottery* by MR. BERNARD RACKHAM; *Near and Far Eastern Pottery* by MR. R. L. HOBSON. Other writers in this field besides the Departmental Editor, MR. W. E. COX, who has himself contributed several articles, are MR. OSWALD SIRÉN of the Stockholm Museum, DR. JIRO HARADA, DR. A. K. COOMARASWAMY of the Boston Museum of Fine Arts, and PROFESSOR W. H. LAWRENCE of the Massachusetts Institute of Technology. Among those writing on the *Theatre* are MR. MAX REINHARDT and MR. CONSTANTIN STANISLAVSKY, the German and Russian producers respectively. The authorities on architecture include besides MR. HARVEY WILEY CORBETT (the Associate Editor), MR. TALBOT F. HAMLIN, MR. FISKE KIMBALL, HERR ERICH MENDELSON, SIGNOR CORRADO RICCI, PROFESSOR W. B. DINSMOOR, PROFESSOR C. H. REILLY, THOMAS ADAMS, PROFESSOR A. E. RICHARDSON and MR. HOWARD ROBERTSON. DR. D. F. TOVEY'S *Beethoven* is one of the very fine things in this work; worthy of it are his other studies of personalities in music; and he contributes also on *Counterpoint*, *Harmony*, *Instrumentation*, *Rhythm*, as on *Concerto* and *Chamber Music*. By the BISHOP OF TRURO is *Plainsong*; by MR. DEEMS TAYLOR, *American Music*; by MR. J. W. JOHNSON, *Negro Music*; by MR. A. H. FOX-STRANGWAYS, *Indian Music*; by MR. REINALD WERRENATH, *American Song*; by SIR H. WALFORD DAVIES, *Teaching of Music*.

GEOGRAPHY. Contributors in general geography include DR. H. R. MILL (*Geography*); SIR C. F. CLOSE and COL. WINTERBOTHAM (*Map*); CAPT. EDGELL (*Chart*); PROFESSOR PROUDMAN (*Tides*); PROFESSOR G. SCHOTT of Hamburg (the great oceans and seas); MR. E. OWER (*Anemometry*); DR. C. E. P. BROOKS (*Climatic History*); DR. F. J. W. WHIPPLE (*Thunderstorms*). Numbers of contributions to physical geography and to articles on Europe are by MR. W. E. WHITEHOUSE (*Norway*), MR. J. I. PLATT, DR. ASHBY (*Italy*), MR. R. AITKEN and MR. AUBREY BELL (*Spain and Portugal*), PRO-

FESSION MYRES, DR. M. I. NEWBIGIN, MR. S. CASSON, MRS. ALEXANDER and MR. C. A. MACARTNEY (South East Europe), PROFESSOR W. S. LEWIS (East Central Europe), PROFESSOR A. B. BOSWELL (*Poland*), MISS R. M. FLEMING (*Russia*), PROFESSOR MICHOTTE (*Belgium*).

Asia has been treated by LORD MESTON, SIR E. MACLAGAN, SIR G. MACMUNN, MR. L. S. O'MALLEY, MR. A. V. WILLIAMSON and MR. O. J. R. HOWARTH, SIR HUGH CLIFFORD, DR. J. PEARSON, MR. E. YOUNG, DR. L. D. STAMP, MME. BRESSON, DR. C. HOSE, MR. E. E. LONG (*S. E. Asia*), PROFESSOR ROXBY (*China*), MR. ROY CHAPMAN ANDREWS (*Explorations in Mongolia*), SIR P. Z. COX (*Persia*), MR. L. H. D. BUXTON (*Mesopotamia*), MR. H. ST. J. PHILBY (*Arabia*), PROFESSORS W. M. CALDER and E. ROBERTSON (Western Asia).

The African articles were prepared by PROFESSOR AUGUSTIN BERNARD, MME. BRESSON, MR. R. U. SAYCE, REV. H. L. BISHOP, MR. F. R. CANA, MR. C. F. REY.

For the Americas, DR. ISAIAH BOWMAN, Director of the American Geographical Society of New York, gave constant and valuable advice on all that relates to the Western hemisphere. PROFESSOR WILLIAM H. DAVIS on *North America*; PROFESSOR N. M. FENNEMAN on the *United States*; PROFESSOR G. C. ENGERRAND on *Mexico*; PROFESSOR PERCY MARTIN on *Brazil*; PROFESSOR MARK JEFFERSON on *Argentina*; and DR. WILLIAM H. HAAS on *Chile*. Among special articles may be mentioned that on the *Galapagos* by WILLIAM BEEBE, on the *Yellowstone National Park and Geology of the United States* by DR. W. ELMER EKBLAW; the *Philippine Islands* by DR. JAMES A. ROBERTSON; and *Porto Rico* by GOVERNOR HORACE M. TOWNER.

Again, PROFESSOR COLEMAN, MR. W. S. WALLACE, PROFESSOR RUDWELL JONES and MR. O. J. R. HOWARTH wrote articles relating to *Canada*, while SIR W. GRENFELL dealt with *Newfoundland and Labrador* and LORD OLIVIER with *Bermuda*, the *Bahamas*, *Jamaica* and *British Honduras*.

DR. HADDON and MR. E. E. LONG contribute on *New Guinea*, PROFESSOR RISHBETH on *Australia*, MR. H. J. B. DREW on *New Zealand* and SIR EVERARD IM THURN on the Pacific Islands. The *Arctic* regions were treated by DR. R. N. RUDMOSE BROWN and VILHJALMUR STEFANSSON and the *Antarctic* by MR. F. DEBENHAM. The departmental editor, PROFESSOR FLEURE, wishes to have his thanks expressed to MR. E. G. BOWEN, his chief assistant throughout; and to those other expert geographers, MESSRS. E. E. EVANS, S. J. JONES, J. E. J. JONES and MRS. NOELLE DAVIES, who gave much help. They, with MISS S. HARRIS, MRS. ORMSBY, MR. J. I. PLATT and MR. O. J. R. HOWARTH and MR. C. MARLOWE, contributed most of the work on the British Isles. The help of several Embassies and Legations and of the Society for Cultural Relations with Russia is warmly acknowledged.

Turn to PHILOSOPHY AND PSYCHOLOGY. The articles here show marked advance. SIGNOR BENEDETTO CROCE's article on *Aesthetics* is *chef d'oeuvre*. GENERAL SMUTS compacts for this Edition his doctrine of *Holism*. PROFESSOR ERNST CASSIRER of Hamburg University (leader of the Neo-Kantian Movement in Germany) writes on *Neo-Kantianism, Transcendentalism, Truth*. Some other contributors in this field are PROFESSOR S. ALEXANDER (*Primary, Secondary and Tertiary Qualities*); PROFESSOR G. S. BRETT of Toronto University (*History of Psychology*); PROFESSOR L. T. HOBHOUSE (*Comparative Ethics and Comparative Psychology*); PROFESSOR E. HUSSERL of Freiburg-im-Breisgau (*Phenomenology*, where the author writes as an originator); PROFESSORS EDWARD G. BORING and LEONARD T. TROLAND, both of Harvard (*Visual Sensations* and other articles); MONSIEUR MEYERSON of the Institut de Psychologie in Paris (*Explanation*); PROFESSOR JOHN B. WATSON, formerly of Johns Hopkins (*Behaviourism*); PROFESSOR S. RADHAKRISHNAN of Calcutta (*Indian Philosophy*); PROFESSOR E. L. THORNDIKE of Columbia University (*Intelligence Test*); PROFESSOR R. M. WENLEY (*Scepticism*).

EDUCATION. As Associate Editor, DR. CLOUDESLEY BRERETON, whose own knowledge of this subject is unsurpassed in range, has organized the full survey of a far wider field. Amongst his principal British contributors are PROFESSOR SIR PERCY NUNN (*Educational Theory*), the DUCHESS OF ATHOLL (*Elementary Education*), the MASTER OF BALLIOL (*Adult Education*), MISS TUKE, principal of Bedford College (*Women's Education*). Amongst their chief American colleagues are DR. NICHOLAS MURRAY BUTLER, president of Columbia (*Universities* in part), DR. ELLWOOD P. CUBBERLEY of Stanford (part of *History of Education*), DR. CHARLES H. JUDD (part of *Education*), DR. JAMES J. TIGERT, formerly Commissioner of Education at Washington (*United States Bureau of Education*). Other equally distinguished authorities might be added.

Next, THE PHYSICAL AND BIOLOGICAL SCIENCES, to use imperfect distinctions for lack of a more satisfactory definition.

(a) *Astronomy*. PROFESSOR EDDINGTON, the Associate Editor, writes on *Astronomy* generally and on *Star*; SIR J. H. JEANS on *Cosmogony*; SIR FRANK DYSON, Astronomer Royal, takes *Parallax*. *Star Cluster* is by PROFESSOR HARLOW SHAPLEY of Harvard Observatory; *Nebula* by DR. KNOX SHAW of Radcliffe Observatory; *Mars* by PROFESSOR W. H. WRIGHT of the University of California; *Spectroheliograph* by DR. GEORGE E. HALE, Director of the Mount Wilson Observatory.

(b) *Biology*. PROFESSOR J. ARTHUR THOMSON reviews the general subject. DR. C. S. ELTON and PROFESSOR E. S. GOODRICH, both of the University Museum, Oxford, deal respectively with *Ecology* and *Evolution*. DR. J. B. S. HALDANE writes on *Heredity*; DR. F. A. E. CREW of Edinburgh on *Sex*; PROFESSOR D. M. S. WATSON of University College, London, on *Zoology*,

DR. HENRY FAIRFIELD OSBORN and DR. WILLIAM K. GREGORY, both of the American Museum of Natural History, on *Mammalian Palaeontology*; and DR. LELAND O. HOWARD, of the Department of Agriculture, Washington, contributes articles on injurious insects.

(c) *Botany*. PROFESSOR W. BROWN and PROFESSOR R. J. TABOR, both of the Imperial College of Science, contribute on *Plant Pathology* and *Fungi* respectively; PROFESSOR F. E. FRITSCH of East London College on *Algae*; MR. W. T. SAXTON on *Gymnosperms*; DR. E. J. SALISBURY on *Ecology of Plants*; DR. M. C. RAYNER on *Mycorrhiza*; DR. WILLIAM CROCKER, of the Boyce Thompson Institute, on *Weeds*; and PROFESSOR V. H. BLACKMAN, the Associate Editor, on *Physiology of Plants*.

(d) *Chemistry*. In this division again experts are crowded. The historical introduction is by PROFESSOR H. B. DIXON; *Argon* by LORD RAYLEIGH; *Carbohydrates* by PROFESSOR W. N. HOWARTH; *Applied Chemistry* by DR. HARRISON E. HOWE, Editor of "Industrial and Engineering Chemistry"; *Synthetic Dyes* by PROFESSOR A. G. GREEN; *Stereochemistry* by DR. W. H. MILLS; *Chlorophyll* by PROFESSOR R. ROBINSON; *Valency* by DR. N. V. SIDGWICK; *Atomic Weights* by PROFESSOR THEODORE W. RICHARDS; *Chemical Warfare* by BRIG. GEN. SIR HAROLD B. HARTLEY, C. G. DOUGLAS, MAJ. GEN. AMOS A. FRIES and PROF. J. E. ZANETTI; *Flame* by PROFESSOR A. SMITHELLS; *Thermochemistry* by MR. H. T. TIZARD, permanent Secretary to the Department of Scientific and Industrial Research, London.

(e) *Geology*. The general article is by the Associate Editor, DR. R. H. RASTALL; and *Sedimentary Rocks* by PROFESSOR P. G. H. BOSWELL; *Ore Deposits* by DR. F. H. HATCH; *Origin of Continents* and *Geology of Asia* by MR. PHILIP LAKE of Jesus College; the geology of the South American countries by MR. GEORGE MCL. WOOD; *Crystallography* and *Mineralogy* by DR. L. J. SPENCER; *Petrology* and *Metamorphism* by DR. C. E. TILLEY.

(f) *Mathematics*. PROFESSOR DAVID EUGENE SMITH of New York, who has devoted a life-time to the history of mathematics, has arranged the work of this department. The articles on *Geometry* in its principles and applications, on *Forms* and *Numbers*, are chiefly by American experts like DEAN EISENHART, PROFESSOR R. C. ARCHIBALD, PROFESSOR BATEMAN, PROFESSOR E. BELL and PROFESSOR OSCAR VEBLEN.

(g) *Medicine*. DR. W. S. LAZARUS-BARLOW has been the Associate Editor for this great department to which he has himself contributed several articles. His collaborators include: SIR GEORGE BUCHANAN and SIR GEORGE NEWMAN of the Ministry of Health, dealing respectively with *Public Health* and *Preventive Medicine*; SIR HUMPHREY ROLLESTON on *Medicine* generally. PROFESSOR R. T. LEIPER on *Parasitic Diseases*; DR. GEORGE A. SOPER, Managing Director of the American Society for the control of Cancer, on *Cancer Control*; DR. C. S. READ on *Insanity*; PROFESSOR CLAUDE REGAUD of the Radium Institute, Paris, on *Radium Therapy*; DR. EDWARD C. ROSENOW of the Mayo Foundation and DR.

J. OPPIC McCALL, New York University, on *Focal Infection*; DR. CHARLES SINGER on the *History of Medicine*; SIR WILLIAM WILLCOX of the Home Office on *Poisons*. Other contributors are PROFESSOR HAVEN EMERSON, who holds the chair of Public Health Administration, in Columbia University, and DR. SIMON FLEXNER, Director of the Rockefeller Institute for Medical Research.

(h) *Physics*. In this department, more than in any other during the last twenty years, conceptions, as we saw, have been radically changed. The Associate Editor, PROFESSOR ANDRADE (who himself writes on essential themes *Nucleus*, *Radiation* and *Vacuum*, and on an always fascinating one, *Transmutation of Elements*), has enlisted a famous corps. Among them are many holders of the Nobel prize. By comparison with former full Editions of the *Encyclopædia Britannica* a new age of knowledge is represented in this group. *Atom* is by PROFESSOR NIELS BOHR; *Electron* by PROFESSOR R. A. MILLIKAN; *Radioactivity* by SIR ERNEST RUTHERFORD; *X-Rays* by PROFESSOR MANNE SIEGBAHN and the DUC DE BROGLIE; *Positive Rays* and *Isotopes* by DR. F. W. ASTON; *Conduction of Electricity in Gases* and *Electric Waves* by SIR J. J. THOMSON; the *Solid State* by PROFESSOR LINDEMANN of Oxford; *Terrestrial Magnetism* and *Atmospheric Electricity* by DR. WILLIAM F. G. SWANN, Director of the Franklin Institute; the *Kinetic Theory of Matter* and *Relativity* by SIR J. H. JEANS; *Spectroscopy* by PROFESSOR A. FOWLER of the Imperial College of Science; *Quantum Theory* by PROFESSOR WILLIAM WILSON of the University of London; *Thermionics* by PROFESSOR O. W. RICHARDSON; *Brownian Movement* by PROFESSOR JEAN PERRIN. *Electricity* is by PROFESSOR HAROLD A. WILSON of the Rice Institute, Houston, Texas. *Heat* is by PROFESSOR H. L. CALLENDAR; the theory of light-waves is expounded under *Light* by PROFESSOR C. G. DARWIN; *Fluorescence* and *Phosphorescence* by MR. ROBERT W. WOOD of Johns Hopkins; *Photo-Electricity* by DR. C. D. ELLIS; *Compton Effect* by PROFESSOR A. H. COMPTON; *Velocity of Light* by PROFESSOR A. A. MICHELSON. *Wireless Telegraphy* is by PROFESSOR E. V. APPLETON for theory and DR. ECCLES for practice; *Television* by DR. HERBERT E. IVES of the Bell Telephone Laboratories, New York; *Photography, History and Technique* by MR. GEORGE EASTMAN and DR. C. E. K. MEES. DR. EINSTEIN's own article on *Space-time* as prepared for the recent Supplement is retained. One other name is reserved to the last in order that it may stand out as that of the doyen on this side of knowledge amongst veteran contributors to successive Editions of the *Encyclopædia Britannica*; we mean SIR OLIVER LODGE, who takes *Physics* generally and *Ether*.

(i) *Physiology*. The Associate Editor is PROFESSOR JOSEPH BARCROFT of Cambridge. Amongst his chief colleagues are SIR CHARLES SHERRINGTON on the *Spinal Cord*; DR. W. B. CANNON of the Harvard Medical School on *Hunger and Thirst*; DR. A. CARREL of the Rockefeller Institute, who revises *Tissue Culture*;

PROFESSOR A. V. HILL on *Muscle and Muscular Exercise*; PROFESSOR J. J. R. MACLEOD of Toronto on *Insulin*; PROFESSOR G. H. PARKER on *Comparative Nervous Systems*; SIR J. H. PARSONS of the London Ophthalmic Hospital on *Vision*.

LAW. Amongst authorities here are a former Lord Chancellor, the EARL OF BIRKENHEAD, LORD JUSTICE SANKEY, LORD LUGARD, LORD ATKIN, MR. JUSTICE EVE, SIR FREDERICK POLLOCK and SIR LESLIE SCOTT. But in the forefront of contributors in this department is its Associate Editor, PROFESSOR J. H. MORGAN, K. C., in the World War ranking as Brigadier-General. Equally notable are some of the American law contributors, especially DEAN ROSCOE POUND of the Harvard Law School, and his colleagues PROFESSORS BEALE, POWELL and LANDIS, PROFESSOR WALTER F. DODD of the Yale Law School, SILAS H. STRAWN and FRANCIS RAWLE, both past Presidents of the American Bar Association, and WILLIAM DRAPER LEWIS, Director of the American Law Institute.

ECONOMICS, including AGRICULTURE TECHNICS AND SOCIOLOGY. *Agriculture*, with its tropical aspects, demands scores of headings. The general article is by SIR DANIEL HALL, and PROFESSORS G. F. WARREN and F. A. PEARSON. Particular attention is given to modern improvements in organization and to the new arrival of scientific aid. SIR JOHN RUSSELL amongst others writes on *Soil*, *Fertilizers* and *Research*; PROFESSOR C. O. REED of the College of Agriculture, Ohio State University, on *Agricultural Machinery*; MR. F. L. ENGLEDOW on *Plant-Breeding*; DR. W. BROWN on *Plant-Pathology*; SIR HENRY REW on a series of interests; SIR HORACE PLUNKETT on *Co-operation in Ireland*; DR. W. M. JARDINE, Secretary of Agriculture in the cabinet of President Coolidge, on *Farmers' Organizations*. We may add here *Irrigation* by SIR MURDOCH MACDONALD; *Fixation of Nitrogen* by PROFESSOR J. T. HEWITT and DR. HARRISON E. HOWE.

Amongst articles on the great general subjects of economics, *Population* is by PROFESSOR CARR-SAUNDERS; *Birth Control* by SIR JAMES MARCHANT; *Economic Man* by PROFESSOR CHARLES GIDE; and *Mass Production* by HENRY FORD. No edition has approached the same range of contributions on the world's basic materials, mineral and vegetable. *Gold Mining and Metallurgy* is by SIR THOMAS KIRKE ROSE and *Coal* and its mining by SIR RICHARD REDMAYNE and R. DAWSON HALL; *Petroleum* by MR. L. M. FANNING; *Rubber* by MR. G. MARTIN of the Imperial Institute and MR. J. W. SCHADE, Director of Research, the B. F. Goodrich Company. The late PROFESSOR ALLYN YOUNG, too early lost to scholarship, was familiarly acquainted with theories and conditions both in Britain and the United States. He took the classical headings: *Economics*, *Capital*, *Labour*, *Wages*, *Wealth*, *Land*, *Rent*, *Price*, *Supply and Demand*.

On the sides of applied science and engineering, we have SIR J. A. FLEMING and MR. EMIL GARCKE on

Electricity Supply; SIR ALFRED EWING on *Steam* and the *Steam Engine*; MR. G. A. BURLS on *Internal Combustion Engines*; DR. FRANK J. SPRAGUE on *Electric Traction*; PROFESSOR W. E. DALBY and MR. STANIER on *Mechanical Power Transmission*; PROFESSOR ARNOLD GIBSON on *Hydraulic Power Transmission* and other themes of hydraulics. *Railways* are dealt with by MR. G. J. PONSONBY and MR. C. E. R. SHERRINGTON; *Ship-building* by SIR WESTCOTT ABELL; *Motor Car* by MR. C. F. KETTERING, Vice-President of the General Motors Corporation; *Motoring and Motor Transport* by the late LORD MONTAGU of Beaulieu; *Traffic and Traffic Regulation* by SIR HENRY MAYBURY and GEN. WILLIAM BARCLAY PARSONS; *Tunnel* by MR. ROBERT RIDGWAY who is in charge of Transit Construction, New York; *Alloys* by DR. ZAY JEFFRIES of the Aluminum Company of America; *Aeronautics and Industrial Research* by SIR RICHARD T. GLAZEBROOK; *Airship* by COMMANDER C. D. BURNEY; *Telegraph* by MR. NEWCOMB CARLTON, President of the Western Union Telegraph Company; *Telephone* by MR. WALTER S. GIFFORD, President of the American Telephone and Telegraph Company.

Take next the great economic movements and controversies concerning human relations and political management. *Socialism* is by MR. GEORGE BERNARD SHAW and MR. G. D. H. COLE; *Guild Socialism, Factory System and Wage System in Industry* by MR. G. D. H. COLE; *Communism* by PROFESSOR EMIL LEDERER and *Bolshevism* by PROFESSOR HAROLD J. LASKI; *Economics of Fascism* by SIGNORA AGRESTI; *Capitalism* by the present Editor-in-Chief; *Trade Unions* by MR. ARTHUR GREENWOOD; *General Strike* by the RT. HON. WILLIAM GRAHAM; and *Strikes and Lockouts (U. S. Section)* by PROFESSOR JOHN R. COMMONS of the University of Wisconsin; *Land Nationalization* by PROFESSOR CHARLES GIDE; *Profit Sharing* by MR. JOHN HILTON and MR. MAGNUS ALEXANDER. MR. HILTON, Director of Statistics for the British Ministry of Labour, writes further on many questions of vital importance at the present day, and amongst them are *Rationalization of Industry, Combination in Industry, Trust, Monopoly, Competition in Industry, Unemployment, Wages. Cartel (Kartel)* is by PROFESSOR ROBERT LIEFMAN, and *Federal Reserve System* by MR. BENJAMIN STRONG, late Governor of the Federal Reserve Bank of New York. To MR. R. G. HAWTREY we owe the treatment of *Money, Banking, Finance*. PROFESSOR HENRY CLAY restates the theory of *Free Trade*; PROFESSOR W. A. S. HEWINS the theory of *Protection*; PROFESSOR FRANK W. TAUSSIG writes *Tariff*. Bearing on both sides of that controversy is the important article on *Balance of Trade*, which though based on a former study by no less an authority than SIR ROBERT GIFFEN has been virtually re-written by SIR JOSIAH STAMP.

The latter authority, though practically and intellectually one of the busiest men in the world, has been

generous enough to undertake more specific themes concerning legislators and politicians in all countries. Amongst these are *Taxation, Income Tax, Wealth and Income, National Savings, Inheritance, Capital Levy*. PROFESSOR A. L. BOWLEY deals with *Cost of Living* and *Price Statistics*. SIR ALFRED WATSON, Government Actuary in London, writes *Insurance: an Introduction*.

Next we must glance at the group of articles devoted to objects of social progress and humanitarian reform which are in principle above debate. DR. RAYMOND UNWIN treats of *Housing*, as also, with MR. THOMAS ADAMS, of *Town Planning*; SIR ALEXANDER C. HOUTON of *Water Purification*; MR. JULIUS ROSENWALD of *Philanthropy*; MR. SEEBOHM ROWNTREE deals with *Poverty Line*; PROFESSOR SAMUEL McCUNE LINDSAY with the question of *Prohibition*; SIR THOMAS OLIVER with *Dangerous Trades*; MISS ELEANOR RATHBONE with *Family Allowances*; MR. C. M. LLOYD with *Poor Law*; MISS MARGARET G. BONDFIELD, with *Maternity and Infant Welfare*; DR. ARTHUR SHADWELL with *Prostitution and Temperance*. GENERAL SIR ROBERT BADEN-POWELL himself discusses *Boy Scouts*. DAME RACHEL CROWDY writes on *Child Labour, Opium Traffic, White Slave Traffic*.

There is an array of contributions upon economic aspects during the World War. In this category are *War Control of Food* by SIR WILLIAM BEVERIDGE; *War Control of Industry* by MR. BERNARD M. BARUCH and E. M. H. LLOYD; *Ministry of Shipping* by SIR JOHN ANDERSON; *Ministry of Munitions* by DR. CHRISTOPHER ADDISON; *War Pensions* by SIR ADAIR HORE.

Post-war economics play an extraordinary part. SIR JOSIAH STAMP writes on *Reparations and the Dawes Plan*; SIR OTTO ERNST NIEMEYER on *Debt Conversion*; while amongst articles on the experiences of various nations are *Great Britain: National Finance* by MR. R. G. HAWTREY. Studies of economic and social conditions in countries like France, Germany, Belgium, Italy, Russia are respectively by MR. J. R. CAHILL of the British Embassy, Paris, PROFESSOR MORITZ J. BONN, MONSIEUR EMIL VANDERVELDE, SIGNORA AGRESTI and MR. MAURICE DOBB of Cambridge.

PAST AND PRESENT

It would be out of place here to dwell on the repute of these representative writers, many of them acknowledged to be the first experts in the world on the subjects they treat in these volumes. They would be the first to admit that numbers of their colleagues, unmentioned here only because this part of the Introduction must put some limit to the list, are as well worthy to be named. The *Encyclopædia Britannica* has not marshalled together at any time since its birth in 1768 an equally large, various and world-wide array of strong contributors. The number and the repute of the writers belonging to the continental scholarship of Europe should be remarked. This organ of reference for the English-speaking world has owed much for

many years to a wider representation of international learning than any other encyclopaedia has attempted to organize.

THE RESULT: TWELVE ASPECTS OF THE FOURTEENTH EDITION

THE outcome of these manifold labours appears in the Fourteenth Edition as now completed. In the broad, it cannot be superseded for many years, though unending research and discovery modify or amplify every day the details of all knowledge; and though in the spheres of the sciences on the one hand and perhaps of pre-history on the other, some suppositions now assumed to be fundamental may be changed at any moment. In form and arrangement, this Edition then is a "new model." As regards form, it may stand for some generations to come, initiating, as it does in several respects, a considered break with traditions of construction derived from the earlier part of the nineteenth century or even from the eighteenth. Its chief distinctive features may now be recapitulated.

- I. The articles in general are more concise and perspicuous; but many still retain the character of monographs on the most important subjects. Amongst the fullest are those on *Greece and Rome*, *English History*, the *United States*, *France*, *Germany*, *Italy*, and other accounts of the chief nations. Next in amplitude are the contributions on subjects so various as *World War*, *Bible*, *Evolution*, *Painting*, *Potteries* and *Theatres*; on *Coal and Coal Mining*, *Iron and Steel*, *Motor-Cars*, *Unemployment*. The space given to *Shakespeare* would fill a hundred pages of an ordinary octavo volume. MR. OSWALD BARRON has revised his former study of *Heraldry*; and on its subject, it still stands pre-eminent in encyclopaedias.
- II. There are about 45,000 separate headings in the Fourteenth Edition by comparison with 37,000 in the Eleventh. But this total is no adequate measure of the real number of articles in the work, for there are tens of thousands of subheadings which cover information and ideas often quite new. The Index with approximately half a million items tells the full story.
- III. All articles bearing on the progressive aspects of science, of medicine and surgery, technical inventions and improvements (as to this, see particularly the salient sections on "wireless" transmission and on aviation) have been originally written in the light of present knowledge. The same is true of economics and industry, sociology and politics.
- IV. The new articles on anthropology, archaeology and ethnology are a much wider and more systematic array.
- V. Since the Eleventh Edition the World War has intervened. Its enormous events; its ceaseless consequences, political, economic, social, in the post-war years; and the immeasurable suggestions of further

consequences in the future—these are narrated, examined and explained in the course of some hundreds of articles and some thousands of pages. For it must be remembered that this theme enters more or less into the recent history of all nations; into their literature and drama, as well as into their political, economic and other social movements. All the newly independent States have required and received study in a manner unthinkable when the Eleventh Edition was organised well before the war-period.

- VI. Especially, the articles upon the League of Nations with the collateral peace-policy of the United States, and upon all subjects connected with these—particularly questions of armament and disarmament, security and reconciliation, minorities and treaties—are a landmark.
- VII. The political and social interests of women, their household and personal interests, occupy a far larger place than in any former work of this nature. In the long run, the transformation, as we may well call it, of the position of women, by the recognition of their equal status in citizenship and by their rapid approach to equal opportunity in education and economics (and, we may add, in athletics), may be remembered as the most profound and far-reaching consequence of the World War. Women are not only fully enfranchised amongst the English-speaking societies, and in other countries, but in an unexpected sense of an old word they form in Great Britain, Germany and elsewhere the "better half" of the electorate.
- VIII. Amongst the biographies many more living persons are noticed. But articles entirely rewritten for the present Edition include the following names predominant in the world's memory (the authors have already been mentioned):—Homer, Plato, Aristotle, Shakespeare, Cromwell, Newton, Washington, Napoleon, Bismarck, Lincoln, Bach, Beethoven, Dostoevsky, Tolstoi.
- IX. In the number of bibliographies appended to articles there is a very large increase. These concluding references to the literature of the subject are an immediate guide to readers who desire to pursue a special study. No feature of the Fourteenth Edition is more useful to intellectual workers who may become interested in a line of enquiry not hitherto familiar. The late Lord Bryce, in a manner very typical of his own many-sided interests, praised this part of the apparatus, when its employment was much less extended than now, in words that cannot be bettered. "One of the difficulties which the increase of specialization has caused is that of knowing what books to consult for a general view of any large subject, and what other books for its special departments. . . . The selection of the best becomes harder as the volume of literature on every subject grows. There is no more lamentable waste of time than that spent on reading a second- or third-rate work when a first-rate one is available; and there is

no better test of the utility of an encyclopædia article than the amount of help to the student which a carefully selected list of books supplies."

X. *Illustration*.—The Fourteenth Edition, as may be seen at a glance into any volume, differs very vividly in one respect not only from all its own predecessors, but from any work of the kind yet undertaken. In the history of encyclopædias it is the first to be furnished with every resource of illustration. No pictorial equipment on this scale, or on any scale approaching to this, has been attempted up to now. There are over fifteen thousand illustrations of all varieties in the entire array of volumes—from eight to nine hundred in each volume. Amongst these the full plates are commanding, for by themselves they number about fifteen hundred and many are in colour. The quality of the technique may be judged by the facsimile of an illuminated page from the Gutenberg Bible—so far as we know, the first book printed from movable type—where the gold embellishment is preserved as faithfully as the tints. The other plates in colour are drawn from the most various sources. They represent prehistoric cave-painting; the arts and crafts of early Egyptian, Mesopotamian and Aegean civilization; ceramics, bronzes, jewels, tapestries and tissues belonging to many epochs; painting and sculpture; historical documents; architectural designs and stage-costumes, as well as birds, fishes, insects and the general life of nature. Particular attention has been devoted in the coloured illustrations, as in the printed text, to Asiatic art—Chinese, Japanese, Indian and Persian—so much more acutely considered by experts, and widely appreciated by amateurs, since the character of the Eleventh Edition was determined. The full plates not coloured show the range of modern photography, now recording the strokes of forked lightning, now discerning from the air the immemorial lines of prehistoric habitation and agriculture. Thousands of small vignettes in black and white are distributed through the text. In addition are the plans, charts, diagrams and patterns. It is proper to note that this work of illustration was carried out by a lively equality in combination between the London and New York offices; but for the whole result, the credit is due to Mr. Warren E. Cox, departmental Editor for the fine and applied arts, and responsible for the illustrations.

XI. *Maps*.—For purity of colour and clearness of inscription the maps, from the standpoint of the general reader's convenience, show a very apparent and agreeable gain in the geographical part of illustration. The principal plates executed by John Bartholomew and Son of Edinburgh are ranged as a general Atlas bound up in the twenty-fourth, and last, volume of the work. The greater number of these maps are political, showing with admirable distinctness all places of importance, as well as the river-systems,

the frontiers, the internal boundaries and the railway-lines. Other maps give the physical features of the different continents; and of countries whose geographical relief is of exceptional interest, like Switzerland, Canada, the United States, India and the British Isles. Needless to say that all the new demarcations resulting from the World War and decreed by the Peace Treaties—or effected at some points by later changes—are shown in line and tint on the political maps. Apart from the Atlas, many maps, some in black and white, some in colour, are inserted in the text of the other volumes. These elucidate many regional features, especially the lay-out of the great mountain-systems and the plains they dominate. Again they show the physical resources of the world; the changes of nations; the growth of the United States from the original Thirteen Colonies to its present boundaries. And yet again the state of countries or continents at different moments as ancient Greece, conquering Rome, the Europe of the 10th, 12th and 16th centuries, of 1715, 1810 and 1815, of the century ending 1914, which includes the rise of the German Empire and the re-birth of the Balkan nations. The world's sources of raw materials are displayed on a new plan. The present relations of visible supplies to annual demands are made clear. Aeroplane views are used to reveal new aspects of modern cities as for the traces of pre-history.

XII. *Aids to Reference*.—More pains than ever before have been taken and more devices employed to assist the eye. What we may call the mechanical aids to rapid and sure use have been bettered in every way. The Index is of course the great engine of reference, unique amongst encyclopædias. Though too few take full advantage of its resources, wise readers know how to make it an intimate and incessant friend. It is the real key to that present degree of all-knowledge whereof only a fraction can now be contained by any human memory. This time, the Index comprises half a million headings. It is embodied in a separate volume; but as it is good to save the minutes and even the seconds of readers, pains have been taken also to make all the volumes as far as possible self-indexing throughout. To this end cross-references have been multiplied. As well, in all but the shortest articles, cross-headings and side-headings in stronger print light up the text; so that at need, the eye may travel as quickly as possible to any required particular of an extended subject. The small type, used to a very large extent in earlier editions, has been abandoned entirely except in bibliographies and extended quotations. The body of the new typography speaks for itself. It is probably a pattern of clean, shapely printing for the purposes of the *Encyclopædia Britannica*, which on this occasion has had to put about thirty-five millions of words into its twenty-four thousand pages.

DIDEROT AND THE LITTLE THINGS

FOR the inclusion in the Fourteenth Edition of so many familiar little things and of all the lighter interests of life, its sports and pastimes, there is the best precedent. This aspect, so far from being an affront to the proper dignity of encyclopaedias, is only a return to the most famous of examples—that of Diderot himself, one of the nimblest and most humorous as well as powerful of all intelligences. As “politics are present history,” so modern dress and fashion—typical, as it happens, of the emancipation of women—demand notice no less than ancient and mediaeval costume. If cookery receives more detailed and practical attention, that is certainly what Montaigne as well as Mrs. Glass would have approved. “Cross-words” have been brought in. What precisian would be stiff enough to exclude them? Or the article upon “Children’s Games”? Discovery in the greatest sciences may have the most intimate and sometimes disconcerting reactions on the small affairs. Under some rays, pure diamonds and other gems are instantly distinguished from imitations. All this only brings us back to Voltaire’s celebrated passage about Diderot’s *Encyclopédie* as discussed in a royal conversation at Trianon. There were differences of ideas as to how gunpowder was made. The Duc de Nivernois thought it curious that people should shoot partridges and each other “without knowing exactly how the killing is done.”

“Alas,” said Madame de Pompadour, “we are reduced to that about everything in the world: I don’t know how they compound the rouge that I put on my cheeks and I should be vastly puzzled if they were to ask me how they made my silk stockings.”

“’Tis a pity, then,” said the Duc de la Vallière, “that his Majesty should have confiscated our encyclopaedias which cost us a hundred pistoles apiece; we should soon find there an answer to all our difficulties.”

After dinner they sent three lackeys for the volumes containing Powder and Rouge. “Then Madame de Pompadour learnt the difference between the old rouge of Spain, with which the ladies of Madrid coloured their faces, and the rouge of the ladies of Paris.” Voltaire’s memory here is not quite up to his wit. Madame de Pompadour herself was dead before the scene he describes could have occurred. But some other beauty of the Court may well have made the remark he attributes. The substance of the story is usually held to be well founded, and its spirit is true to the time. There is no more refreshing gift in men and women than intelligent and ever-active curiosity instead of the dull acceptance of results without any effective desire to understand more of processes. The editing of this Edition has gone back very consciously to Diderot’s conception, too often forgotten by some of his ablest successors—that an encyclopaedia ought to be not only an abstract of learning but a mirror of the world. Diderot includes a miniature

article on “Blushing,” which quotes in English a flow of graceful lines by Dryden.

FOUR IDEALS

YET we cannot think of the lighter precedents without remembering the greater. An old weighty question recurs. Is it permissible, and if so is it possible, for an undertaking like the *Encyclopædia Britannica* to pursue any ideal aim of its own through all the intricacies of the practical task? Nothing can be allowed to interfere with the duty of organizing with an unbiassed mind the presentment of facts and opinions in all their modern range. No form of religion, for instance, and no particular race or nation must suffer prejudice. Gibbon remarks somewhere to this effect that it is a right mark of civilized temper always to respect that which is respectable to others. Views which we most dislike may be none the less a power requiring to be examined and comprehended like natural forces. We must see Bolshevism and Fascism as they see themselves before criticism of either can begin to be effectual.

This admitted obligation of detachment and impartiality may seem to make more doubtful the answer to the question whether it is permissible and possible for a great work of general reference to serve any particular ideal. But the answer is affirmative in several respects; for some ideals are above controversy. There will appear in these pages an endeavour so to deal with all questions bearing on war and peace as to promote international reconciliation and enable people on matters where they are still at variance to arrive at a clearer understanding of each other’s standpoints and motives. The trilogy on what was absurdly called “War Guilt”—one might as well attribute to part of mankind the “double dose of original sin”—is worked out in the spirit of “The Ring and the Book,” showing in what different lights the same question may be seen.

Again, in this encyclopaedia, once more re-made for the use of the English-speaking world, there is a definite design to forward by information and explanation the cause of closer moral sympathy and practical concord amongst those communities now nearing an aggregate of 200,000,000 souls who hold the language in common. For there can be no deeper conviction than one which possesses the present writer—that without the assured political harmony of the English-speaking peoples, no confident belief in the future of any civilized hope can be entertained. The names of His Majesty the King and of the President of the United States stand together on the dedication page not only as a unique honour conferred upon these volumes, but as a symbol of that one good cause which is the key of success to the largest number of others.

Thirdly, it is the definite ideal of the Fourteenth Edition to promote throughout the English-speaking world a general interest in science and to enlist stronger support for its purposes. The future of civilization

depends more on this than on any other factor. For various reasons—material, imaginative and what we venture to call spiritual. Literature and art themselves would be renewed by closer contact with modern science than is yet usual. On the material side, we are so deeply involved mid-way that we must go further to extricate ourselves. In this respect the world beyond doubt is in its crude infancy. For one instance, it is in our power beyond doubt with sufficient public energy to supersede the dirt, foulness, ugliness derived from the industrial revolution and to replace these offensive and injurious defects by a smokeless civilization and by a seemingly ordering, without and within, of industrial and domestic architecture. But even this is the least by comparison with other needs and means in human life. By the aid of science, productivity in agriculture and industry alike may be augmented so as to improve incalculably the conditions and opportunities of the common lot throughout the world. The call for more and more chemists and physicists is heard well enough though by no means adequately answered. There is at least equally urgent need in every nation, and especially in those with tropical responsibilities, for more and more biologists. Everywhere in that sphere a strong and well-aided reinforcement of trained men and women is required. Again in a manner far removed from the beneficent utilities, science to-day has an imaginative quality, and possibilities of artistic stimulus, unknown since the Renaissance. Literature and art, to be very great once more, must assimilate and make luminous the essential ideas emerging from the new, noiseless, controlled revolutions of thought in the spheres both of physics and biology formerly quite apart, now more and more significantly associated. On the spiritual side, to repeat that unexpected term in this connection, the temper of modern science contrasts with that of the former generation. The old, deterministic dogmas have been dissolved. Instead, we have the recognition of unfathomable mysteries regarding on one hand the infinitesimal particle, if we can any longer conceive a "particle," and on the other hand, a universe, reaching beyond the remoter nebulae, which profound speculation may conceive as finite, but which is far vaster than former more anthropomorphic conceptions of "infinity" could conceive. From modern science a new, coherent idealism, adequate for at least some generations, may emerge. It can never be supplied by literature and ethics irrationally dissociated from what we call the scientific part of knowledge.

Finally, an encyclopædia like this, on a scale extensive enough to reflect the ideas of an age as well as its operations, does what the single intellect, however potent, can no longer do; what no private library even, however ample, can do. It assimilates what is essentially instructive in the contents of all the vast libraries and in the ideas of all living brains, so far as these have been publicly communicated; and it thus

represents the abiding truth that knowledge in itself is none the less a unity because its totality is beyond our grasp. That it might be within the grasp of some higher order of beings is what we implicitly assume in all our ways of thinking and imagining. As gain rarely occurs without loss of some kind, specialization in more and more contracted limits, in more and more intent and absorbing forms, is that inescapable modern method for which an increasing price has to be paid, not only by the expert individual, but perhaps by society in ways easy to feel but hard to measure. Concerning the varieties of work in which we are respectively steeped, we are apt to become less intelligible to each other. General conversation more rarely takes a wide intellectual play. It is no paradox to say that probably in this clamorous age there are more silences of individuals about their deepest interests than ever before.

Modern philosophers—and physicians—have insisted that some general effort of will ought to be made to correct this tendency in the intellectual field; that every specialist should cultivate other mental interests. Increasing pressure and preoccupation through the day's hours forbid at present any facile solution of this characteristic modern difficulty. Yet, leaving apart that idea of happiness which has been described as the fullest rational development and exercise of all faculties, and taking only the point of utility, it seems certain that our best thoughts about our special subjects often come when we have disengaged our minds and turned them freely to something quite different. The *Encyclopædia Britannica* opens to the specialized intelligence the readiest means of entering into other spheres of enquiry and insight. Fresh imagination gained in ways seeming at first sight the most remote from the day's usual work may throw unexpected light upon it. A map of the world is not less an excellent device because none of us can travel all the territories it displays. Some real sense of the range and main divisions and real unity of the universe of knowledge, however untraversable by any single person most of the regions on the mental map may be, is a benefit to any mind; and so much without extreme difficulty is manageable.

Goethe had the nobler thought that each of us must "have the nerve," as he said, to make ourselves feel one with the whole. It is good to understand as much as we may of the life of other persons and other nations. "Der Einzelne nur froh und glücklich sein kann, wenn er den Muth hat, sich im Ganzen zu fühlen." Sympathy in this higher sense is apt to grow with variety of acquirements. The specialist most appreciates the discovery of simplifying laws. The movement for peace would have no meaning if its part of the sense of unity did not spring from a deeper philosophy than as a rule it knows.

As often has been said, every main Edition of the *Encyclopædia Britannica* has historic significance.

Recording the stages of thought, methods of work, action of circumstances and manners of life belonging to the world at a given date, it keeps in its way irreplaceable value as the contemporary chronicle of one generation; and it provides a standard of measurement by which a later generation may most easily reckon the degree of

its own further progress. In this aspect, the Fourteenth Edition seems to the present writer as significant as any encyclopaedia hitherto known; but so far as any credit may be deserved, never was more of it due to close colleagues, associates and collaborators on both sides of the Atlantic.

J. L. GARVIN.

PUBLISHERS' NOTE: Another printing of the present Edition being already necessary to meet the public demand, occasion is taken to make many improvements in detail. New articles have been inserted, existing ones brought up to date, certain bibliographies enlarged, and valuable full page plates added.

March, 1930.

PUBLISHERS' NOTE: Again advantage is taken of the fact that another printing is necessary, to make certain changes and additions in the Encyclopaedia. A few new articles have been added, as that on the important LONDON NAVAL CONFERENCE, 1930, written jointly by the Rt. Hon. James Ramsay MacDonald, Prime Minister and Chief British Delegate to and Chairman of the Conference, and by the Hon. Henry L. Stimson, United States Secretary of State and Chairman of the United States Delegation to the Conference. A number of new full page plates have also been added, a few in black and white, more in colour.

April, 1932.

INITIALS AND NAMES OF CONTRIBUTORS IN VOLUME I WITH THE ARTICLES WRITTEN BY THEM.

A. B. C.	A. B. CULLEY, F.I.A. The Eagle Star and British Dominions Insurance Co.	} Agents in Business.
A. Be.	AUGUSTIN BERNARD. Professor of Geography and of Colonization of the Peoples of North Africa, at the Sorbonne, Paris. Author of <i>L'Archipel de la Nouvelle Calédonie</i> ; <i>Les Régions Naturelles de l'Algérie</i> ; etc.	} Algeria; Algiers (<i>in part</i>).
A. B. R.	ALFRED BARTON RENDLE, M.A., D.Sc., F.R.S. Keeper of the Department of Botany, British Museum (Natural History).	} Angiosperms (<i>in part</i>).
A. B. Wm.	A. B. WOLLAM. President, American Sugar Refining Company, New York.	} American Sugar Refining Company.
A. C.	ALBERT CALMÈS. Professor at the University of Frankfurt, Germany. Conducted an enquiry into the economic and financial situation of Albania for the League of Nations.	} Albania (<i>in part</i>).
A. C. I.	ANDREW CONWAY IVY. Nathan Smith Davis Professor of Physiology and Head of the Division of Physiology and Pharmacology, Northwestern University Medical School, Illinois.	} Anaemia (<i>in part</i>).
A. D. H.	SIR ALFRED DANIEL HALL, K.C.B., M.A., HON.LL.B., HON.D.Sc., F.R.S. Director of the John Innes Horticultural Institution. Chief Scientific Adviser to the Ministry of Agriculture and Fisheries. Formerly Director of the Rothamsted Experimental Station.	} Agricultural Organization; Agriculture: A General Survey (<i>in part</i>).
A. D. L.	ALEXANDER DUNLOP LINDSAY, C.B.E., HON.LL.D. Master of Balliol College, Oxford. Professor of Moral Philosophy, Glasgow University, 1922-4. Author of <i>The Philosophy of Bergson</i> ; etc.	} Adult Education (<i>in part</i>).
A. D. M.	A. D. MITCHELL, D.Sc., F.I.C. Assistant Editor to the <i>Journal of the Chemical Society</i> ; Assistant Examiner in Chemistry, University of London and Institute of Chemistry.	} Acid (<i>in part</i>); Allotropy; Ammonia.
A. E. H.	MAJOR ADRIAN ELLIOT HODGKIN, M.C., M.A., F.I.C. The Technical Department, Imperial Chemical Industries, Ltd.	} Alkali Manufacture (<i>in part</i>).
A. F. B.	ALDRD FARRER BARKER. Professor of Textile Industries, Leeds. Author of <i>Wool and the Textile Industries</i> ; etc.	} Alpaca (<i>in part</i>).
A. Fo.	ALEXANDER FORBES, A.M., M.D. Associate Professor of Physiology, Harvard Medical School. Author of papers on the Physiology of the Nervous System.	} All-or-None Law.
A. F. P.	ALFRED FRANCIS PRIBRAM, PH.D. Professor of Modern History in the University of Vienna.	} Aehrenthal, Aloys Lexa von.
A. G.	ARTHUR GOFTON, F.R.C.V.S. Chief Veterinary Inspector, Edinburgh, Scotland.	} Abattoir.
A. G. M. B.	A. G. M. BATTEN. The Alliance Assurance Company. Fellow of the Chartered Insurance Institute. Sometime Stanley Brown Prizewinner of the Chartered Insurance Institute.	} Accident Insurance, Personal (<i>in part</i>).
A. G. McC.	ARTHUR GILLET MCCALL. Soil Scientist, United States Department of Agriculture. Author of <i>Physical Properties of the Soil</i> ; <i>Studies of Crops</i> .	} Alkali Soils.
A. G. Pi.	ANDREW G. PIERCE. President, American Woolen Company.	} American Woolen Company, The.
A. H.	SIR ALFRED HOPKINSON, K.C., M.A., B.C.L., HON.LL.D. Vice-Chancellor, Victoria University (Manchester) 1910-3. Treasurer of Lincoln's Inn, 1921.	} Adoption.
A. H. D.	A. H. DAVIS. The National Physical Laboratory, Teddington, England. Joint Author with G. W. C. Kaye, of <i>Acoustics of Buildings</i> .	} Acoustics of Buildings, The.
A. H. Q.	MRS. A. H. QUIGGIN, M.A. Lecturer, Department of Geography, University of Cambridge.	} Agriculture, Primitive.
A. J. B. W.	ALAN JOHN BAYARD WACE, M.A. Deputy Keeper, Victoria and Albert Museum, London. Late Director of the British School of Archaeology, Athens. Norton Lecturer, American Archaeological Institute, 1923-4. Author of <i>A Catalogue of The Sparta Museum</i> ; <i>Prehistoric Thessaly</i> ; etc.	} Aegean Civilization (<i>in part</i>).

- A. J. R. MISS A. J. ROBERTSON, M.A. } Anglo-Saxon Law (*in part*).
- A. L. K. A. L. KROEBER, PH.D. }
Professor of Anthropology in the University of California. Author of *Zuni Kin and Clan*; *Anthropology*; etc. } Algonkin.
- A. L. W. REV. A. LUKYN WILLIAMS, D.D. }
Hon. Canon of Ely Cathedral. Examining Chaplain to the Bishop of Durham, 1901-13. } Aceldama.
- A. M. ALLEN MAWER, M.A. }
Provost, University College, London; formerly Baines Professor of English Language at the University of Liverpool; Director of Survey of English Place Names. } Aethelflaed or Ethelfleda; Aethelstan.
- A. M. B. A. M. BOAL. }
United States Shipping Board, Washington. } Admiralty Jurisdiction (*in part*).
- A. Me. ANTOINE MEILLET. }
Membre de l'Institut, Professor at the Collège de France, Paris. } Albanian Language.
- A. P. R. A. P. ROWE. }
Scientific Officer, Air Ministry, London. Lecturer on Air Navigation and Instruments, Imperial College of Science, London. } Aerial Navigation.
- A. R. S. A. R. SMYTHE. }
Professor at the Royal Veterinary College, Camden Town, London. } Abortion, Contagious.
- A. Sa. SIR JAMES ARTHUR SALTER, K.C.B. }
Director of the Economic and Finance Section of the League of Nations. General Secretary to the Reparations Commission, 1920-2. Secretary of the British Department of the Supreme Economic Council, 1919. Secretary of the Allied Maritime Transport Council and Chairman of the Allied Maritime Transport Executive, 1918. Author of *Allied Shipping Control, an Experiment in International Administration*. } Allied Maritime Transport Council.
- A. S. E. SIR ARTHUR STANLEY EDDINGTON, D.Sc., F.R.S. }
Plumian Professor of Astronomy, Cambridge University. Director of the Observatory, Cambridge; Senior Wrangler, 1904; Smith's Prizeman, 1907; Fellow of Trinity College, 1907. President of the Royal Astronomical Society, London, 1921-3. Editor of the Astronomy Section, 14th Edition, *Encyclopædia Britannica*. Author of *Stellar Movements and the Structure of the Universe*. } Aberration of Light; Algol.
- A. Si. ARTHUR SIDGWICK, M.A., LL.D. }
Fellow of Corpus Christi College, Oxford; formerly Reader in Greek, Oxford University. } Aeschylus.
- A. T. P. ALBERT T. POFFENBERGER, PH.D., Sc.D. }
Professor of Psychology, Columbia University, New York. Author of *Psychology in Advertising*. } Advertising (*in part*).
- A. W. H. E. W. WING COMMANDER A. W. H. E. WYNN, O.B.E. }
Member of the Staff of the Intelligence Department of the Air Ministry, 1916-22. } Air Forces (*in part*).
- A. W. McK. ANDREW W. MCKAY, B.Sc. }
Assistant Chief, Division of Co-operative Marketing, United States Department of Agriculture, Washington. Author of *Practical Co-operative Marketing*. } Agricultural Co-operation (*in part*).
- A. Wo. A. WOLF, M.A., D.LITT. }
Professor of Logic and Scientific Method in the University of London; sometime Fellow of St. John's College, Cambridge; Fellow of University College, London. Editor of the Philosophy and Psychology section, 14th Edition, *Encyclopædia Britannica*. Author of *The Oldest Biography of Spinoza*; *Textbook of Logic*. } Absolute; Abstract and Abstraction; Analogy.
- B. Cr. BENEDETTO CROCE. }
Senator of the Kingdom of Italy, 1910-7; Minister of Public Instruction, 1920-1; Secretary of the Historical Society of Naples; Doctor *honoris causa* of the University of Oxford; Hon. Doctor of Philosophy, University of Fribourg (Baden); Member of the *Accademia Nazionale dei Lincei* and of the Prussian Academy. Author of *Filosofia dello spirito*; *Problemi di Estetica*; *Nuovi Saggi di Estetica*; *Frammenti di Etica*; etc., etc. } Aesthetics.
- B. F. C. A. B. F. C. ATKINSON, PH.D. }
Under-Librarian, University Library, Cambridge. } A; Achaeans; Alphabet.
- B. H. L. H. CAPT. B. H. LIDDELL HART, F.R.Hist.S. }
Military Historian and Critic. Military Correspondent to the *Daily Telegraph*, London. Editor of the Military History section, 14th Edition, *Encyclopædia Britannica*. } Allenby, Edmund Henry Hynman.
- B. J. O. B. J. OWEN, M.A., D.Sc. }
Director of the Institute of Agricultural Engineering, Oxford. } Agricultural Machinery and Implements (*in part*).
- B. M. BUDGETT MEAKIN. }
Author of *The Moors*; *The Land of the Moors*; *The Moorish Empire*. } Almohades (*in part*); Almoravides (*in part*).
- B. M. J. B. MELVILL JONES, A.F.C., M.A., F.R.A.E.S. }
Francis Mond Professor of Aeronautical Engineering in the University of Cambridge. } Aerodynamics.
- C. A. B. C. A. BROWNE, D.Sc., PH.D. }
Chief of Chemical and Technological Research, United States Department of Agriculture, Washington. Editor, *A Half Century of Chemistry in America*. Author of *Chemical Analysis of American Honeys*; *Handbook of Sugar Analysis*. } Adulteration (*in part*); Agriculture: A General Survey (*in part*).
- C. A. M. CARLILE AYLMER MACARTNEY. }
Scholar of Trinity College, Cambridge. H.B.M. Acting Vice-Consul for Austria, 1921-6. Passport Control Officer for Austria, 1922-5. Author of *The Social Revolution in Austria*; *Survey of International Affairs for 1925*, Part II. (*in part*). } Alexandrov, Todor.

- C. Br. CLOUDESLEY BRERETON, M.A., L-ès-L.
Member of Legion of Honour; D-ès-L. (Hon.Causa.), Lille University. Late Divisional Inspector to the London County Council. Editor of the Education section, 14th Edition, *Encyclopædia Britannica*. } Academies (*in part*).
- C. C. A. M. C. C. A. MONRO, M.A.
Assistant in the Zoological Department of the British Museum (Natural History). } Annelida (*in part*).
- C. C. T. CHARLES CUTLER TORREY, PH.D., D.D.
Professor of Semitic Languages, Yale University. } Ahasuerus.
- C. C. Ta. CHARLES CALLAN TANSILL, PH.D.
Professor of American History, American University, Washington. Author of the *Canadian Reciprocity Treaty of 1854; Documents Illustrative of the Formation of The Union*. } Albany Congress; Annapolis Convention.
- C. D. B. COMMANDER SIR CHARLES DENNISTOUN BURNEY, C.M.G., R.N.
Inventor of the Paravane. } Airship; Airship Sheds.
- C. E. P. B. C. E. P. BROOKS, D.Sc., F.R.A.I.
Honorary Secretary Royal Meteorological Society. } Africa (*in part*).
- C. E. T. C. E. TILLEY, B.Sc., Ph.D., F.G.S.
Lecturer in Petrology, University of Cambridge. } Amphibole; Amphibolite.
- C. F. R. CHARLES FERNAND REY.
Commander of the Star of Ethiopia; Formerly Assistant Secretary, Ministry of Labour, London. Author of *Unconquered Abyssinia as it is Today; In the Country of the Blue Nile*; etc. } Abyssinia (*in part*).
- C. G. S. CHARLES GABRIEL SELIGMAN, M.D., F.R.C.P., F.R.S.
Professor of Ethnology, London School of Economics, University of London. Formerly President of the Royal Anthropological Institute. Author of *The Melanesians of British New Guinea*; etc. } Africa (*in part*).
- C. H. C. CHARLES H. COLVIN, M.E.
President and General Manager, Pioneer Instrument Company, Inc., Brooklyn, N.Y. Inventor of many aircraft instruments. } Air Log or Air Distance Recorder.
- C. H. van T. CLAUDE HALSTEAD VAN TYNE, PH.D.
Head of Department of History, University of Michigan, Ann Arbor, Mich. Author of *Causes of The War for Independence; Loyalists in The American Revolution; The American Revolution*. } American Revolution (*in part*).
- C. Li. CALDWELL H. LIPSETT.
Formerly Editor, *Civil and Military Gazette*, Lahore, India. } Afridi (*in part*).
- C. Ll. M. CONWY LLOYD MORGAN, D.Sc., LL.D., F.R.S.
Emeritus Professor, formerly Professor of Zoology and Geology in University College, Bristol. Principal of the College, 1887-1909. First Vice-Chancellor of the University of Bristol. Author of *Introduction to Comparative Psychology*; etc. } Animal Behaviour.
- C. M. Wo. CLARENCE M. WOOLLEY.
President, American Radiator Company, New York. } American Radiator Company, The.
- C. O. R. C. O. REED, B.S.
Professor of Agricultural Engineering, Ohio State University of Agricultural Engineering, Columbus, O. Engineering Adviser in European Corn Borer Control and Research, United States Department of Agriculture. } Agricultural Machinery and Implements (*in part*).
- C. P. REV. CHARLES PLUMMER, M.A.
Fellow of Corpus Christi College, Oxford. Author of *Life and Times of Alfred the Great*; etc. } Alfred (The Great).
- C. R. B. CHARLES RAYMOND BEAZLEY, M.A., D.LITT., F.R.G.S., M.R.A.S.
Professor of History, University of Birmingham; late Fellow of Merton and University lecturer in History and Geography, Oxford; formerly on Council of R.G.S. and of Hakluyt and African Societies, and a member of the House of Laymen; Member of Advisory Committees of British Labour Party for International Affairs and for Education; Member of Executive of Birmingham Labour Party. Author of *History of Russia; Nineteenth Century Europe*; etc. } Andrew of Longjumeau.
- C. S. CHARLES E. SPEARMAN, PH.D., F.R.S.
Associate Foreign Member, Société Française de Psychologie. Professor of Philosophy of Mind and Logic, University of London. } Abilities, General and Special.
- C. W. F. LIEUT.-COLONEL C. W. FORD, R.A.
Senior Instructor in Ammunition, Military College of Science, Woolwich. } Ammunition (*in part*).
- D. C. S. REV. CANON DAVID CAPELL SIMPSON, M.A., D.D.
Oriental Professor of Interpretation of Holy Scripture, Oxford; Canon of Rochester Cathedral; Fellow of Oriel College; Reader in Semitic Languages and Old Testament, Manchester College, Oxford; Examining Chaplain to the Bishop of Southwell 1913-25. } Achiacharus.
- D. E. S. DAVID EUGENE SMITH, PH.D.
Professor Emeritus of Mathematics, Teachers College, Columbia University, New York. Departmental Editor for Mathematics, 14th Edition, *Encyclopædia Britannica*. } Abacus; Algebra.
- D. E. W. D. E. WOODHULL.
President, American Bank Note Company, New York. } American Bank Note Company, The.
- D. G. D. SQUADRON LEADER D. GRAHAME DONALD, R.A.F., D.F.C., A.F.C., M.A. } Air Co-operation (*in part*).
- D. G. H. DAVID GEORGE HOGARTH, M.A., C.M.G., D.LITT., F.B.A.
Late Keeper of the Ashmolean Museum and Fellow of Magdalen College, Oxford. Excavated at Paphos, 1888; Naucratis, 1880 and 1903; Ephesus, 1904-5; Assiut, 1906-7; Director, British School at Athens, 1897-1900; Director, Cretan Exploration Fund, 1899. } Aegean Civilization (*in part*).

INITIALS AND NAMES OF CONTRIBUTORS

D. H.	DAVID HANNAY. Formerly British Vice-Consul at Barcelona. Author of <i>Short History of Royal Navy, 1217-1688</i> ; <i>Life of Don Emilio Castelar</i> ; etc.	Abbadides; Almohades (<i>in part</i>), Almoravides (<i>in part</i>); Alphonso I.

KEY TO PRONUNCIATION

Vowels

ă, fat, man, pang	ē, mete, meet, meat	ōō, move, spoon
ā, fate, mane, dale	ur, her, fern, heard	ŭ, tub, son, blood
ah, father, far, guard	ī, pin, it, biscuit	ū, mute, acute, few
aw, fall, talk, naught	ī, pine, fight, file	ö, pull, book, could
à, ask, fast, path*	ō, not, on, pot	ü, German ü, Fr. u
ě, met, pen, bless	ō, note, poke	ö, as in Fr. peu, feu

*The sound here indicated may vary between *ah* and *ă*.

Modification of Vowels

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening. Thus:

a, prelate, courage, America
e, allegation, episcopal

o, abrogate, actor, democrat

Composite Sounds

oi, oil, joint, boy
ow, pound, proud, now
ā, fair, hare, bear

ēr, era, chimaera
ōr, floor

ñ, French nasalized
n, as in ton, en

Consonants

The consonants have their ordinary English value. It should be noted, however, that:

c is not used, but represented by k or s as the case may be.

g is always hard.

y has always its consonantal value.

Modified Consonants

tu, nature, adventure
sh, pressure
zh, seizure
th, thin

th, then
ch, as in German ach,
Scotch loch

ly, French liquid l, as
in mouillé
l, Welsh ll, as in Llan-
dudno, and Slav.
palatal l

' denotes a primary, " a secondary accent.

THE ENCYCLOPÆDIA BRITANNICA

FOURTEENTH EDITION

VOLUME I A TO ANNOY

THIS letter has stood at the head of the alphabet during the whole of the period that it can be traced historically. The name of the letter in the Phoenician period resembled the Hebrew name *aleph* and was taken over by the Greeks in the form of *alpha*. In the Phoenician alphabet the letter stood for a species of breathing or inherent sound,

since vowels were not represented in the Semitic alphabets. The view that the Greeks received their alphabet directly from the Phoenicians has now been largely abandoned. The character may therefore have stood for a vowel in the alphabet before the Greeks took it over. It must indeed almost certainly have done so if it was in use among the peoples of Asia Minor previous to its use by the Greeks. Throughout its history variations have occurred in the form of the letter. The Phoenician form was *𐤀*. In the Lydian alphabet of the fifth century B.C. it appeared as *Α*, in the Carian alphabet *Α* or *Α*. In the early Greek alphabet from the island of Thera, which may possibly be dated as far back as the eighth or ninth century B.C., its form was *Α* or *Α*. In the Greek alphabet of classical

times its form was usually *Α*. Early Italian and Latin forms are *Α* and *Α*. As early as the middle of the second century A.D. we find *λ* as a form of *Α*, and this is the ancestor of our present minuscule printed *a* by way of uncial *λ* (fourth century) and *λ* (eighth century), uncial writing being the name given to the round hand which in late Roman times superseded the square capitals that had been suitable for inscription in stone. Under the influence of the uncial hand this form was adopted into Carolingian minuscules. Our rounded minuscule *a* derives from Latin cursive, in which in the fifth century A.D. appears the astonishing form *τ*. This is a hastily-written majuscule *Α* distorted by its apex having fallen to the left. In the sixth century the cursive form was *τ*, and from this in the seventh century develops the form *u*, from which the rounded form of the Irish and early English hands grew. The rounded capital *α* that sometimes appears in handwriting is the minuscule letter written large.

The sound for which the letter consistently stood in Greek and Latin, and doubtless, generally speaking, in its immediate pre-Greek history, was the open low back vowel, usually known in modern English as continental *a*. There are of course countless slight variations in the method of pronouncing this sound. In English the sound has undergone far-reaching changes during and since the Middle English period. These are due to *fronting*, that is to say, pronouncing the sound more towards the front of the

mouth, or to *rounding*, slightly rounding the lips, which has the effect of causing the sound to be pronounced higher in the mouth. At the present time the letter represents six principal vowel-sounds: (1) its original value, the low back vowel, as in *father*; (2) an intermediate vowel, as in *man*; (3) a closer vowel, further fronted, as in *here*, occurring only before the liquid *r*; (4) a diphthong (*ei*) as in *take*, *spade*. This is the sound that the letter now normally represents when the vowel is long. (3) represents a stage in the development of the sound on its way from (1) to (4) which was arrested at this point when the vowel was followed

NAME OF FORM	APPROXIMATE DATE	FORM OF LETTER
PHOENICIAN	B.C. 1,200	𐤀
CRETAN	1,100-900	Α
THERAEAN	700-600	Α
ARCHAIC LATIN	700-500	Α Α Α
ATTIC	600	Α α
CORINTHIAN	600	Α Α
CHALCIDIAN	600	Α
IONIC	403	Α
ROMAN COLONIAL	PRE-CLASSICAL AND CLASSICAL TIMES	Α Α
URBAN ROMAN		Α
FALISCAN		Α and Α
OSCAN		Α Α Α
UMBRIAN		Α
CLASSICAL LATIN AND ONWARDS		Α

THE DEVELOPMENT OF THE LETTER A FROM PHOENICIAN TIMES, THROUGH CLASSICAL GREEK AND LATIN, TO THE PRESENT DAY

by *r*. A similar fronting of this sound took place in the Ionic-Attic dialects of Greek, where sounds derived from the *a*-sound and represented in other dialects by *α* are represented by *η*.

The two remaining developments of the sound are due to rounding: (5) the vowel of *water* and (6) the vowel of *was*. This development is due to the influence of the preceding bilabial spirant *w*.

(B. F. C. A.)

In *Music*, A is the name of the first note of the musical alphabet and constitutes the 6th degree of the scale of C. In respect of pitch A=435.4 vibrations per second, this being the standard pitch or *diapason normal*. A is the note always given to orchestral players, usually by the oboe, for tuning purposes. (See *PITCH*.)

A₁ AT LLOYD'S, a popular expression denoting super-excellence, derived from the prestige of the world's chief shipping registry, Lloyd's Register of British and Foreign Shipping. In fact, the highest classification assigned to iron and steel ships is "100 A₁". In this symbol, "100 A₁" denotes the condition of the hull, while the "1" denotes efficiency of equipment. "A₁" is almost obsolete, being the symbol of the highest classification of wooden vessels.

(See *LLOYD'S REGISTER OF BRITISH AND FOREIGN SHIPPING*.)

AA, the name of many small European rivers. The word is derived from the O. G. *aha*, cognate to the Latin *aqua*, water (cf. Ger. *-ach*; Scand. *ä*, *aa*, pronounced *ö*). Among the streams

of this name are:—Two rivers in west Russia, falling into the Gulf of Riga with Riga lying between their mouths; a river in northern France flowing through St. Omer and Gravelines, and a river of Switzerland, in the cantons of Lucerne and Aargau, which carries the waters of Lakes Baldegger and Hallwiler into the Aar. In Germany there are the Westphalian Aa, joining the Werre at Herford, the Münster Aa, a tributary of the Ems, and others.

AABENRAA, a town of Denmark, in Slesvig, at the head of a bay of that name, being an arm of the Little Belt. It has a good harbour and a large carrying trade. Pop. about 6,000. Until 1919 it was in the German province of Schleswig.

AACHEN (Fr. *Aix-la-Chapelle*; Dutch *Aken*), ancient city and spa, Rhenish Prussia, Germany, under the northern slopes of the Ardennes, on the Cologne-Brussels main line, 44m. W. by S. of Cologne. Pop. (1925) 155,300. Its municipal boundaries coincide on the west with the frontiers of Belgium and Holland. In general appearance a prosperous, modern commercial town, it is full of mediaeval associations. The outer town is mainly new; while the ramparts of the old inner town are now promenades, with two ancient gates, Ponttor and Marschiertor, remaining. The hot sulphur springs have been celebrated for centuries. The conspicuous cluster of buildings in the centre of the city includes the cathedral and the Rathaus (town hall), a Gothic structure (1353-1370) built on the ruins of Charlemagne's palace, which contains the magnificent coronation hall of the emperors (143ft. by 61ft.). The two original towers, Granusturm and Glockenturm, were all but destroyed by fire in 1883; their restoration was completed in 1902. Near the Rathaus is the Grashauss, restored in 1889 to house the municipal archives. The cathedral, or minster, is in two distinct styles. The Romanesque *Octagon*, begun in 796, the finest extant Carolingian structure, was modelled on San Vitale at Ravenna, and consecrated by Pope Leo III. in 805. Emperor Otto III. rebuilt it, on the original lines, in 983, after its destruction by Norman raiders. It is surrounded on the first storey by a gallery (the Hochmünster) with antique marble and granite columns, of various sizes, brought from Rome, Ravenna and Trier, removed by Napoleon to Paris, but restored after 1815. The mosaic representing Christ surrounded by "the four-and-twenty elders," which originally lined the cupola, was executed in 1881 from a 17th century copy of the ancient originals. The bronze west doors date from 804. Underneath the dome, tradition places the tomb of Charlemagne, said to have been opened by Otto III. in 1000 and to have shown the emperor's body on a marble chair which was removed and long used for coronations. It is now in the gallery. The site of the tomb is marked by a stone slab, with the inscription *Carlo Magno*, and above it hangs the famous bronze chandelier presented by the emperor Barbarossa in 1168. In the Hungarian chapel, to the south-west, is the rich Cathedral Treasury, with fine mediaeval work such as the 13th century gold casket containing the relics of Charlemagne. The Gothic choir was added during the 14th and 15th centuries and contains the tomb of the emperor Otto III. The pulpit, a gift of emperor Henry II., dates from c. 1020. The cathedral possesses many relics, the more sacred of which are exhibited only once every seven years, when they attract large crowds.

The churches of St. Foillan (founded in the 12th century, but twice rebuilt, in the 15th and 17th centuries, and restored in 1883) and St. Paul, with its beautiful stained-glass windows, are interesting. The Suermondt museum contains fine pictures by early German, Dutch and Flemish masters. There are many fine streets, squares and public monuments. The fountain in the market square is surmounted by a statue of Charlemagne. In the principal square, Friedrich-Wilhelmplatz, is the Elisenbrunnen, with its colonnade and garden, the chief resort of visitors taking the baths and waters.

Since the working of extensive coalfields in the district almost every branch of iron industry has been carried on. Cloth, glass, needles and pins are important products. The suburb of Burtscheid, incorporated with Aachen in 1897, has old-established manufactures of cloth and needles and contains, among frequented thermal springs, the Schwertbad-Quelle (171°F.), the warmest spring in Germany.

History.—The ancient city and watering place of Aachen represents the Aquisgranum of the Romans, named after Apollo Granus, who was worshipped in connection with hot springs. As early as A.D. 765 King Pippin had a "palace" there, in which it is probable that Charlemagne was born. The greatness of Aachen was due to the latter, who between 777 and 786 built a magnificent palace on the site of that of his father, raised the place to the rank of the second city of the Empire, and made it for a while the centre of Western culture and learning. From the coronation of Louis the Pious in 813 until that of Ferdinand I. in 1531 the sacring of the German kings took place at Aachen; as many as 32 emperors and kings were crowned there. Late in the 12th century (1172-76) the city was surrounded with walls by order of the emperor Frederick I., to whom (in 1166)

BY COURTESY OF REICHSZENTRALE FÜR DEUTSCHE VERKEHRSWERBUNG
THE RATHAUS OR TOWN HALL AT AACHEN, ERECTED IN 1353-70 ON THE
SITE OF THE PALACE OF THE EMPEROR CHARLEMAGNE

and to his grandson Frederick II. (in 1215) it owed its first important civic rights. In the 16th century Aachen began to decline. It lay too near the French frontier to be safe, and too remote from the centre of Germany to be convenient, as a capital; and in 1562 the election and coronation of Maximilian II. took place at Frankfort-on-Main, a precedent followed till the extinction of the Empire. The city suffered gravely in the religious wars, being twice put under the ban of the Empire for Protestantism. By the Treaty of Lunéville (1801) Aachen was incorporated with France as chief town of the department of the Ruhr. In 1815 it was given to Prussia. In Nov. 1918, at the conclusion of the World War, Aachen was occupied for a period by Belgian troops.

AAHMES: see AMASIS.

AAL, also known as A'L, ACH, or AICH, the Hindustani names for the *Morinda tinctoria* and *Morinda citrifolia*, plants extensively cultivated in India on account of the reddish dye-stuff which their roots contain. The name is also applied to the dye, but the common trade name is *Suranji*. Its properties are due to the presence of a glucoside known as *Morindin*, which is compounded from glucose and probably a trioxy-methyl-anthraquinone.

AALBORG, seaport on the south bank of the Limfjord, North Jutland, Denmark, capital of Aalborg amt, and one of Denmark's oldest towns. Pop. (1927), 42,819. It is the seat of a bishop (1554) and has some old buildings, Jens Bangs Stenhus,

the castle called Aalborghus, the Holy Ghost monastery and the Budolfi church. The municipal privileges date from 1342. Industries include cement works, tobacco works, distilleries, chemical works (sulphuric acid and superphosphate), cloth mills and the ship yard.

AALEN, a town in Württemberg, Germany, situated on the Kocher, a tributary of the Neckar, at the foot of the Swabian Alps, about 50m. E. of Stuttgart. Pop. (1925) 12,250. Woollen and linen goods and ribbons are manufactured, and there are tanneries and large iron works. Aalen was a free imperial city from 1360 to 1802, when it was annexed to Württemberg.

AALESUND, seaport of Norway, in Møre fylke (county), 160m. N. by E. of Bergen by sea. Pop. (1926) 18,238. It is built on three islands, Nørvø, Aspø and Hissen, enclosing the harbour. Founded in 1824, Aalesund is one of the most important export towns of Norway for fish and fish products. It lies in a very productive fishing district; to the north-west lie the great cod-banks of Storeggen and Nyeggen. Vessels also fish off Iceland, while a fleet of sealing boats is sent to the Arctic ocean. There are numerous factories connected with the fish industry and oil refineries, engineering works and a seining factory. Aalesund is a port of call for the Norwegian South American Line (on account of the export of klip-fish) and for the routes Trondhjem-Hamburg, Trondhjem-France and Trondhjem-England, and also for most coasting vessels trading in Western Norway. There is some tourist industry connected with the adjacent centres of Geiranger and Jørund fjords. In 1904 Aalesund was wasted by a terrible fire, a fate which has befallen many Norwegian towns, built largely of wood. In the following years the town was planned on new lines and the houses in the centre were built of brick.

AALI, MEHEMET, PASHA (1815-1871), Turkish statesman, was born at Constantinople, the son of a government official. He was ambassador in London (1842-45), and then foreign minister under Reshid Pasha. He took part in the congress of Vienna (1855) and in the congress of Paris (1856), and was five times grand vizier. Aali Pasha was one of the most zealous advocates of the introduction of Western reforms under the Sultans Abdul-Mejid and Abdul-Aziz. He died at Erenkoi in Asia Minor on Sept. 6, 1871.

AALSMEER, a town in the province of North Holland, Holland, situated in low country about 10m. S.W. of Amsterdam. Pop. (1927) 7,288. It has railway communication with Haarlem and Utrecht. The flat country with its fertile sandy soil, which can be easily watered, provides ideal conditions for horticulture, and the town is surrounded by flower gardens and plant nurseries. Large quantities of plants, bulbs and blooms are exported annually.

AAR or **AARE**, the largest river entirely within Switzerland. It rises in the great Aar glaciers, in the canton of Berne, west of the Grimsel pass. Beyond the Handegg waterfall the river traverses the Hasli Thal and expands into the Lake of Brienz, where it becomes navigable. It then crosses the swampy plain of the Böödeli, between Interlaken (left) and Unterseen (right), before again expanding into the Lake of Thun. Running north-north-west it encircles the lofty bluff on which the town of Berne is built, and then turns west, and later north. Near Aarberg its stream is diverted west by the Hagneck canal into the Lake of Bienne whence the Nidau canal runs east to Büren. Henceforth its long north-east valley drains the central lowland of north Switzerland, parallel to the Jura. The chief tributaries in this stretch are the Grosse Emme, Wigger, Suhr and Aa, all from the right. Below Brugg it receives first the Reuss, and then the Limmat or Linth. It now turns due north, and soon becomes itself an affluent of the Rhine (left), which it surpasses in volume when they unite at Coblenz, opposite Waldshut. Length of river, 181m. Area of basin, 6,804sq.m.

AARAU, the capital of the Swiss canton of Aargau. Pop. (1928), 11,500, mostly German-speaking Protestants. It is on the right bank of the Aar at the southern foot of the Jura, about 50m. by rail north-east of Berne, and 31m. north-west of Zürich. An ancient fortress, it was taken by the Bernese in 1415, and in 1798 became for a time the capital of the Helvetic republic.

Eight miles by rail north-east are the famous sulphur baths of Schinznach, near which is the ruined castle of Habsburg, the original home of that house. The industrial museum contains good painted glass of the 16th century, from the neighbouring Benedictine monastery of Muri (founded 1027, suppressed 1841—the monks are now quartered at Gries, near Bolzano). The cantonal library contains many works relating to Swiss history and many mss. coming from the suppressed Argovian monasteries. The industries include silk-ribbon weaving, foundries, cutlery, electrotechnical products and scientific instruments. The novelist and historian, Heinrich Zschokke (1771-1848), spent most of his life here, and a bronze statue has been erected to his memory. Aarau is an important military centre.

AARD-VARK (ard' vark), "earth-pig," the Dutch name for ant-eating mammals of the genus *Orycteropus*, confined to Africa (see EDENTATA). The typical form is *O. capensis*, or Cape ant-bear from South Africa; the northern aard-vark (*O. aethiopicus*) of north-eastern Africa, extends into Egypt. The body is stout, with arched back; the limbs are short and stout, armed with strong, blunt claws; the ears long; and the tail thick at the base and tapering gradually. The elongated head is set on a short thick neck, and at the extremity of the snout is a disc in which the nostrils open. The mouth is small and tubular, furnished with a long extensile tongue. A large individual measured 6ft. 8in. In colour the Cape aard-vark is pale sandy or yellow, the hair being scanty and allowing the skin to show; the northern aard-vark has a still thinner coat, a shorter tail and longer head and ears. These animals are nocturnal and burrowing. The strong claws make a hole in the side of the ant-hill, and the insects are collected on the extensile tongue.

THE CAPE AARD-VARK OR ANT-EATER OF AFRICA WHICH GROWS USUALLY TO A LENGTH OF ABOUT 5FT.

AARD-WOLF (earth-wolf), a South and East African carnivorous mammal (*Proteles cristatus*), like a small striped hyena, but with a more pointed muzzle, sharper ears, and a long erectile mane. It is burrowing in habit, and sometimes attacks lambs.

AARGAU, a canton of north Switzerland, comprising the lower course of the River Aar (*q.v.*), whence its name. Its total area is 548sq.m. It forms the north-eastern section of the great Swiss plateau which occupies the trough between the Alps and the Jura. Its fertile valleys alternate with pleasantly-wooded hills.

In 1415 the Aargau region, previously the centre of the Habsburgs, was taken from them by the Swiss Confederates. Berne kept the south-west portion (Zofingen, Aarburg, Aarau, Lenzburg and Brugg), but some districts, named the *Freie Ämter* or "free bailiwicks" (Mellingen, Muri, Villmergen and Bremgarten), with the county of Baden, were ruled as "subject lands" by all or certain of the Confederates. In 1798 the Bernese part became the canton of Aargau of the Helvetic republic, the remainder forming the canton of Baden. In 1803 the two halves (plus the Frick glen, ceded in 1802 by Austria to the Helvetic republic) were united under the name of Canton Aargau, which was then admitted a full member of the reconstituted Confederation.

The estimated population of the canton in 1925 was 247,100, almost exclusively German-speaking with Protestants predominating. The capital is Aarau (*q.v.*), while other towns are Baden, Zofingen, Reinach, Rheinfelden, Wohlen and Lenzburg. Aargau has profited from the exploitation of hydro-electric power. Silk-ribbon weaving is an old industry and electro-technic production has been developed, while tobacco and wines are produced. There are extensive saline-springs at Rheinfelden, while Baden (*q.v.*) has a tourist industry dependent on its hot sulphur springs. The cantonal constitution dates mainly from 1885, but since 1904 the election of the executive council of five members is made by a direct vote. The canton sends 12 members (on the basis of the 1920 census) to the federal *Nationalrat* and two to the *Ständerat*.

See E. Zschokke, *Geschichte des Aargaus*, Aarau, 1903; W. Merz, *Die mittelaltl. Burganlagen und Wehrbauten d. Kant. Aargau*, Aarau, 1904-06.

AARHUS, seaport and second city of Denmark, capital of Aarhus amt, east coast of Jutland, on Aarhus bay. Pop. (1927) 76,226. It was a district of prehistoric settlement and has five runic stones of the 10th-11th century A.D. It is first mentioned as a town in the 12th century, since when, at least, it has been the seat of a bishop. A small cathedral of stone of that date is incorporated in the later Church of Our Lady. The town had ramparts and moats. St. Clemens cathedral was first built in the Romanesque style (1201), but later rebuilt in Gothic (14th and 15th centuries). The town's first charter is dated 1441. Aarhus has a large harbour of three basins, water area 110 hectares, quay length 13km., and even this is being largely extended (1928). It is the shipping and commercial centre for Jutland; also known for its iron and its oil industries. The district is low-lying, fertile and well wooded.

AARON, the traditional founder and head of the Jewish priesthood, who, in company with Moses, led the Israelites out of Egypt (see EXODUS, THE; MOSES). His association with Moses in this matter goes back to an ancient tradition, current in northern Israel, though the records derived from the south do not seem to mention him till after the Exile.

In the earlier narratives of the Pentateuch Aaron is mentioned in connection with four events only, (a) the Exodus itself, where he appears as the companion of Moses, (b) as supporting Moses at the battle of Rephidim, (c) as the maker of the golden calf (see CALF, GOLDEN) and (d) as rebelling, along with his sister Miriam, against the authority of Moses, on the ground that the latter had married a foreign wife (Num. xii.). It may be conjectured that his name did not occur in the original story from which the narrative of Ex. xxxii. was ultimately derived, but as it stands the passage suggests—as does also (d)—that there was a tradition of hostility between Moses and Aaron, rather than one of association.

Throughout the period of the monarchy (at least since the death of David) and even in Ezekiel, the legitimate priests at Jerusalem belong to the house of Zadok. It is only after the Exile that Aaron takes his place. In the whole of the sacerdotal literature, commonly ascribed to P, Aaron stands by the side of Moses. The latter is the representative of the secular power of Yahweh, Aaron is his religious vice-gerent. Thus he takes a share in producing the plagues in Egypt, stands by his brother's side (in the pre-exilic narratives he is called the brother of Miriam, but not of Moses) by the Red sea, wields the sacred rod, is chosen and miraculously vindicated as high priest, and is made the centre of the whole ritual system.

The process by which tradition changed Aaron from being a possible rival to Moses into his ecclesiastical counterpart, has never been satisfactorily explained. R. H. Kennett has advanced the theory that the Aaronides were originally the priests of Bethel, and that their post-exilic position in Jerusalem was due to a compromise made during or shortly after the Exile. This theory certainly offers an explanation of several difficulties, but there are others which it fails to meet, and hence it has not met with general acceptance. (T. H. R.)

AARON'S ROD, the popular name given to various tall flowering plants such as garden orpine, or live-for-ever, great mullein and goldenrod. In architecture the term is given to an ornamental rod with sprouting leaves, or sometimes with a serpent entwined round it (from the Biblical references in Exodus vii. 10 and Numbers xvii. 8).

AARSSSENS or **AARSEN**, **FRANCIS VAN** (1572-1641), Dutch diplomatist and statesman. Johan van Oldenbarneveldt sent him, at the age of 26 years, as a diplomatic agent of the States-General of the United Provinces to the court of France. He helped to negotiate the 12 years' truce in 1606. Recalled from his post by Oldenbarneveldt in 1616, he was one of the "packed" court of judges who in 1619 condemned the aged statesman to death. For his share in this judicial murder a deep stain rests on the memory of Aarssens. He was confidential adviser on foreign affairs to Maurice, prince of Orange, and afterwards to Frederick Henry, and was sent on special embassies to Venice, Germany and England.

AASEN, IVAR (1813–1896), Norwegian philologist and lexicographer, was born at Aasen i Orsten, in Søndmøre, Norway, Aug. 5, 1813, the son of a small peasant-farmer. Gradually, by dint of infinite patience and concentration, the young peasant became master of many languages, and began the scientific study of their structure. His first publication was a small collection of folk-songs in the Søndmøre dialect (1843). The *Grammar of the Norwegian Dialects* (1848) and the *Dictionary of the Norwegian Dialects* (1850) prepared the way for the wide cultivation of the popular language in Norwegian, since Aasen really did no less than construct, out of the different materials at his disposal, a popular language or definite *folke-maal* for Norway.

With certain modifications, the most important of which were introduced later by Aasen himself, this artificial language is that which has been adopted ever since by those who write in dialect, and which later enthusiasts have once more endeavoured to impose upon Norway as her official language in the place of Dano-Norwegian. Aasen composed poems and plays in the composite dialect and continued to enlarge and improve his grammars and his dictionary. He lived quietly in lodgings in Christiania, but his name grew into wide political favour as his ideas about the language of the peasants became more and more the watchword of the popular party.

Quite early in his career (1842), he had begun to receive a stipend to enable him to give his entire attention to his philological investigations; and the *Storting*—conscious of the national importance of his work—treated him with more generosity as he advanced in years. After the 1873 edition of his *Dictionary*, he added but little to his stores. Ivar Aasen holds perhaps an isolated place in literary history as the one man who has invented, or at least selected and constructed, a language which has pleased so many thousands of his countrymen that they have accepted it for their schools, their sermons and their songs. He died in Christiania, Sept. 23, 1896.

AASVOGEL, the name by which the South African species of vultures are known. Literally it means "carion-bird."

"A" BATTERY, a battery which provides heating current for the filament of a vacuum tube (see THERMIONIC VALVE).

AB, the fifth month of the ecclesiastical year of the Jews. It corresponds to the period of July 15 to Aug. 15. The word is of Babylonian origin, adopted by the Jews after the Babylonian exile. On the ninth is kept the Fast of Ab, or the Black Fast, to bewail the destruction of the first temple by Nebuchadnezzar (586 B.C.) and of the second by Titus (A.D. 70).

ABA, (1) a form of altazimuth instrument, invented by, and called after, Antoine Thomson d'Abbadie; (2) a rough homespun manufactured in Bulgaria; (3) a long coarse shirt worn by the Bedouin Arabs.

ABĀBDA, a nomad tribe of Arabs who reach northward to the Kena-Kuṣayr road, in the country east of Luxor Dirān, Aswān and the Northern Atbai. They call themselves "sons of the Jinns," and they are the Gebadei of Pliny and probably the Troglodytes of classical writers. From time immemorial they have acted as guides to caravans through the Nubian desert and up the Nile valley as far as Sennar. Many of them are employed in the telegraph service across the Arabian desert. They are great trade carriers, and visit far away districts. The Abābda of Egypt, numbering some 30,000, are governed by an hereditary "chief"; they generally speak Arabic mingled with Barabra words. As a tribe they claim descent from Selman, an Arab of the Beni Hilāl. They have adopted the dress and habits of the fellahin. In Nubia they live in villages and employ themselves in agriculture. Others fish in the Red Sea and hawk the salt fish in the interior. Others are pedlars, while charcoal-burning, wood-gathering and trading in gums and drugs, especially in senna leaves, occupy many. The Abābda build huts with hurdles and mats, or live in natural caves. They have few horses, using the camel as beast of burden or their "mount" in war. They live chiefly on milk and durra, the latter eaten either raw or roasted. They are very superstitious, believing, for example, that evil would overtake a family if a girl member should, after her marriage, ever set eyes on her mother: hence the Abābda husband has to make his home far

from his wife's village. In the Mahdist troubles (1882–98) many "friendlies" were recruited from the tribe.

Keane, *Ethnology of Egyptian Sudan* (1884); *Anglo-Egyptian Sudan*, edited by Count Gleichen (1905); Joseph von Russegger, *Die Reisen in Afrika* (1841–50); H. A. MacMichael, *History of the Arabs in the Sudan* (1922).

ABACA or **ABAKA**, a native name for the plant *Musa textilis*, which produces the fibre called manila hemp (*q.v.*).

ABACUS, an early device for tracing numerals on a dust covered board. There have been three standard types: (1) a board covered with dust, whence the derivation, or, at a later period, with wax, and serving the same purpose as a slate in the 19th century or as the modern pad of paper; (2) a table marked with lines upon or between which were placed loose counters in the form of small discs of metal, bone, glass or other material, or (in China) in the form of rods; and (3) a table on which the counters were fastened by means of grooves, wires or rods as seen in the modern number frames often used in teaching children.

The early counter abacus was a table with lines to represent units, tens, hundreds, etc., or to represent different units of value, like pounds, shillings and pence. Addition on such an abacus was doubtless performed as represented in fig. 1, which shows the successive steps in the addition of 64 and 239. Subtraction was simply the process of taking away counters; multiplication was considered as repeated addition, and division as repeated subtraction. This type of abacus was known in the Mediterranean countries, and Herodotus (c. 450 B.C.) is authority for the statement that the Egyptians wrote their figures and reckoned with pebbles "bringing the hand from right to left," while the Greeks proceeded in the opposite direction. There are several references to the abacus in Roman literature, and what is apparently a Greek computing table of some kind was found in the 19th century on the island of Salamis, being still preserved in the Epigraphical museum at Athens (fig. 2).

FROM SMITH, "HISTORY OF MATHEMATICS"

FIG. 1.—A PROBABLE FORM OF EARLY COMPUTATION

The lines represent hundreds, tens and units. The computation represented is: $239 + 64 = 299 = 29[10]3 = 2[10]3 = 303$

FROM SMITH, "HISTORY OF MATHEMATICS"

FIG. 2.—THE SALAMIS ABACUS

Made of white marble, this abacus was found on the island of Salamis. It is of uncertain date but "in some features it is not unlike the tables used by bankers of the middle ages"

Latin writers tell of three types of abacus in use in Rome, namely: (1) the sand board or the wax tablet, (2) a marked table for counters, and (3) a table with grooves in which the counters were free to slide. Fig. 3 shows a late Roman abacus now in the British Museum, each upper button representing five units of the order in which the column stands, and each lower button representing one unit of the same order. Cicero (*Phil. Frag.*, V., 59) speaks of the counters as *aera* (bronzes), but the common name was *calculi* (pebbles) or *abaculi*, the pieces being made of

stone, ivory (Juvenal, xi., 131), metal or coloured glass (Pliny, *Hist. Nat.*, xxxvi., 26, 67).

The earliest type of abacus in China seems to have been the "bamboo rods," that served instead of counters. These were known as early as the sixth century B.C. and they survived in Korea until the close of the 19th century (fig. 4). They found

VARIOUS TYPES OF EARLY COMPUTING DEVICES

Fig. 3.—A late Roman abacus, whose source is unknown. This bronze plate of uncertain date has grooves in which the counters slide. Each upper button represents five units and each lower button one unit of the order in which the column stands.

Fig. 4.—Korean computing rods. Made of bone, these rods were used in the native Korean schools until the end of the 19th century.

Fig. 5.—A Japanese ruled "Sangi" board. Upon this board the computing rods ("Sangi") were placed to represent algebraic coefficients.

Fig. 6.—A modern Chinese abacus. The "suan-pan" was used as early as the 12th century. The number represented is 27091. Each upper bead has a value of five of its order and each lower bead the value of one of its order. Often employed in Chinese laundries.

Fig. 7.—A Japanese abacus. The "soroban" was in use as early as the 16th century. The number represented in the central part is 90278.

their way into Japan about the year 600 and were known as *sangi* or *sanchu*. Until recent times they were used to represent algebraic coefficients, being placed on a board ruled as shown in fig. 5. Since the 12th century the *suan-pan* (computing tray; see fig. 6) has been generally used throughout China. The chief difference

between this and the Roman abacus lies in the fact that it has one more bead in each section. In the 16th century this type, slightly changed and bearing the kindred name of *soroban* (fig. 7), found its way into Japan where it is still in use. An abacus differing considerably from the Roman or oriental types is found in the middle eastern countries. The Turks call it the *coulba*; the Armenians, the *choreb*; and the Russians, the *s'choty* (fig. 8). As in the case of the *suan-pan* and the *soroban*, this permits of rapid computation and serves a purpose similar to that of the modern calculating machines (*q.v.*).

There appeared in Europe in the middle ages the line abacus. This type of abacus somewhat resembled the Salamis table. It consisted of a table ruled with horizontal lines representing the

FIG. 9.—A MEDIAEVAL COMPUTING TABLE

This method of ruling the computing board was extensively used in the middle ages.

successive powers of ten, each space representing half the value of the line immediately above it (fig. 9). This type was in use until well into the 18th century. A pupil who could compute on such a table was said to "know the lines," and the verb "to abacus" was used as the equivalent of the verb "to compute." The method employed may be inferred from a passage in Robert Recorde's *Ground of Artes* (about 1542) as shown in fig. 10, while the general appearance of the table is seen in fig. 11 (taken from the same book).

The discs that were used in computing were commonly known in Great Britain as "counters" (countures, cowntouris); in the Latin books as *projectiles* (*pro*, forward, + *jacere*, to throw), being thrown or cast upon the counting board, or as *denarii supputarii* (computing pennies); and in France as *jetons* (with many

ADDITION.

Matter.
The easiest way in this arte, is to abbe but two summes at ones together: how be it, you may abbe more, as I wil tel you anon. therefore to have you write above the summes, you shall write let betwene one of them, it forseth not which, and then by it shall a lyne crosse the other lyne. And afterwarde sette betwene the other summe, so that that lyne may be betwene them: as if you would abbe 2659 to 8342, you must set your summes as you see here.
And then if you lyth, you may abbe the one to the other in the same place, or els you may abbe them bothe together in a new place: which way, because it is most plyneth.

FIG. 10.—A FACSIMILE PAGE FROM ROBERT RECORDER, "GROUND OF ARTES"

This reduced page, from the edition of 1558, shows the first step in the addition of 2659 and 8342.

FIG. 11.—ENGLISH COUNTER RECKONING IN THE MIDDLE AGES

The most common of the English names for the small disks used with the line abacus was "counter." Counters passed out of common use only in the last half of the 16th century.

such variants as *gects*, *jectoires*, *gietons* and *jettons*, from *jacere*, to throw). In Germany a counter was called a *Rechenpfennig* (translation from the Lat. *denarius supputarius*) or *Zahlpfennig* (number penny). Such later expressions as "cast an account," "borrow one," "carry two," and possibly "lay a wager" have their origin in this kind of computation. The Court of the Exchequer (Fr. *chambre de Véchiquier*; Lat., *scaccarium*), the "counting house," the "counter" in the modern shop, billiard counters, poker "chips," and various games trace their origin to the counting board.

Gerbert (c. 1000), who became Pope Sylvester II., invented an "arc abacus" in which each counter bore a certain Indo-Arabic numeral excepting the zero. the periods in groups of three being united by an arc. It had little recognition, however, for as soon as the significance of the zero became apparent (see NUMERALS) it was manifestly of no value.

(See NUMERALS, CALCULATING MACHINES, FINGER SYMBOLS.)

Knott, "The abacus in its historic and scientific aspects," *Transactions of the Asiatic Society of Japan*, Yokohama, 1886, vol. xiv., p. 18 (particularly valuable with respect to the Japanese soroban); F. P. Barnard, *The Casting-counter and the Counting-board*, Oxford, 1916 (the standard treatise on counters; numerous illus.). (D. E. S.)

ABACUS, in architecture, the upper member of a column capital whose function is to provide a supporting surface for the structure above. In Egyptian capitals it is smaller than the parts below and in the late work it has great height. In the Greek Doric order it is a plain square slab, but in the Roman Doric it is usually crowned by a moulding. In the Greek Ionic order it is at first rectangular, to cap the projection of the volutes, but later becomes square, except at corner capitals where it is curved out over the angle volutes. In both Greek and Roman Corinthian orders and in the composite and four-sided or Scamozzi Ionic order it is moulded with concave sides and usually the corners are cut off slightly. In Romanesque architecture the abacus usually is square, with sides splayed or moulded, and in the Gothic, outside of England, it is square or octagonal and richly moulded. In English Gothic, however, circular forms are frequent, especially in 13th century work. The diminutive, *abaciscus*, is applied to the squares of a tessellated pavement.

ABADAN (Persia), an island situated in the delta of the Shatt al 'Arab (q.v.), 40 miles in length, from 2 to 12 miles in breadth, bounded on the north and east by the Karun river (q.v.) and its tributary, the Bahmishir, on the west by the Shatt al 'Arab, and on the south by the Persian gulf. It is known to Arabs as Jazirat-ul-Khidhr from a tomb situated on the Bahmishir dedicated to the saint of that name. Abadan is referred to by the historian Nasir Khusrau, writing in the 13th century, as the most southerly settlement of Mesopotamia, and it is not improbable that it is identical with the site of the port Charax mentioned by Herodotus. The possession of this island was long in dispute between Persia and Turkey. It was definitely allotted to Persia by the Treaty of Erzerum, 1847, the Turks however retaining control of the whole of the Shatt al 'Arab whilst ensuring to Persia freedom of navigation.

In 1909 the Anglo-Persian Oil Company, Ltd. (q.v.), under a lease agreement with the local overlord, the sheikh of Mohammerah, established its pipe-line terminus and refinery on the island between the hamlets of Braim and Bawardah, and this settlement, now known as Abadan (lat. 30° 21' N. long. 48° 17' E.), has developed into a town of 30,000 people organized by the Persian Government as a municipality. Fifteen deep-water jetties have been built along the foreshore to facilitate the loading of tankers and the unloading of machinery, etc. Exports of oil during 1927 from Abadan totalled nearly 4,500,000 tons. During the same period imports of machinery, etc., unloaded at Abadan totalled about 100,000 tons. Over 500 tankers were loaded and some 40 merchant vessels unloaded, whilst miscellaneous local imports of building material totalled about 100,000 tons. The distance along the pipe-line from Masjid Suleiman to Abadan is about 137 miles. Communication exists by roads passable by motor cars from Abadan to Mohammerah, 9 miles; from Abadan to Ahwaz up the pipe-line, 78 miles, and thence to Masjid Suleiman a further 68 miles. A motor road also exists from Basrah (q.v.) to Sibah, opposite Abadan, on the right bank of the Shatt al 'Arab.

See J. W. Williamson, *In a Persian Oil Field* (1927).

ABADDON, a Hebrew word meaning "destruction." In poetry it comes to mean "place of destruction," and so the underworld or Sheol (cf. Job xxvi. 6). In Rev. ix. 11 Abaddon is used of hell personified, the prince of the underworld. The term is here explained as Apollyon (q.v.), the "destroyer."

ABADEH, a small walled town of Persia, lying over 6,000ft. above sea-level in a fertile tract on the road between Isfahan and Shiraz. It has telegraph and post offices, and is famed for its carved wood-work, small boxes, trays, etc., made of pear and box wood.

ABAE, a town, Greece, in the northeastern corner of Phocis, famous in early times for its oracle of Apollo, one of those consulted by Croesus (Herod. i. 46). Its rich treasures (Herod. viii. 33) were sacked by the Persians, and the temple remained ruinous. The oracle was, however, still consulted, e.g., by the Thebans before Leuctra (Paus. iv. 32. 5). The temple, burnt again during the Sacred War, was very dilapidated when seen by Pausanias (x. 35); some restoration and the building of a new temple, was undertaken by Hadrian. Privileges due to the sanctity of the shrine (*Bull. Corresp. Hell.* vi. 171), were confirmed to the people of Abae by the Romans. The polygonal walls of the acropolis may still be seen, with one gateway and traces of town walls below.

See W. M. Leake, *Travels in Northern Greece*, ii. p. 163; V. W. Yorke, *Journal of Hellenic Studies*, xvi. pp. 291–312.

ABAILARD: see ABÉLARD.

ABAKANSK, a town in the Abakansk section of Minusinsk province (Siberia) of the R.S.F.S.R. Pop. of section (1926) 37,281, mainly Russians and Tatars. It is situated in 54° 26' N. and 91° 15' E., north of the junction of the Abakan river with the Yenisei river; it is a river port with a wharf. It lies in the fertile and sheltered Minusinsk oasis and is linked by river to Krasnoyarsk on the Trans-Siberian railway; the railway from Achinsk to Minusinsk passes it on the west bank of the river. It is a centre for grain, potatoes, cattle, beekeeping products, etc., but is liable to occasional severe floods. Near it are tumuli of the Li-Kitai and statues 7 to 9ft. high, covered with hieroglyphs.

ABALONE (a Spanish word of unknown derivation), the name given in California to various species of molluscs of the widely distributed genus *Haliotis* ("ear shells," Ormers). The shell of these animals yields mother-of-pearl and is used in button-making and inlaying. The abalone was a favourite article of food among the Californian Indians and is still eaten in Japan and China. The Californian abalone is represented by three species, *Haliotis splendens*, *H. rufescens*, and *H. cracherodii*. (See ORMER.)

BIBLIOGRAPHY.—See H. Pilsbry, *Manual of Conchology* (1890); J. Kepp, *The Nautilus* (1880). (G. C. R.)

ABANA (or, as indicated to be read in the Hebrew text, *Amana*, classical *Chrysorrhoeas*) and **PHARPAR** (Heb. *Parpar*) the "rivers of Damascus" (II. Ki. v. 12). They are commonly identified with the two most important rivers of the district, the Barada, flowing through Damascus from its source in the Anti-Lebanon, and the 'Awaj, some 8m. S. of Damascus with its source in the Hermon range. The size of the rivers was probably of less moment than the sacredness of their waters. Abana (or Amana) may well be the Barada. A tributary, the Nahr Baniyas, perhaps retains an echo of the name. North of the 'Awaj is the independent Barbar in which we seem to have the name Pharpar. All the rivers of the district are either entirely dissipated in irrigation or eventually lose themselves in marshes to the east.

ABANCOURT, CHARLES XAVIER JOSEPH DE FRANQUEVILLE D' (1758–1792), French statesman, was Louis XVI.'s last minister of war (July 1792), and organized the defence of the Tuileries for Aug. 10. He was arrested for treason to the nation and sent to Orleans to be tried. At the end of August the Assembly ordered Abancourt and the other prisoners at Orleans to be transferred to Paris. At Versailles the escort learned of the massacres at Paris, and Abancourt and his fellow-prisoners were murdered on Sept. 8, 1792.

ABANDONMENT, in law, the relinquishment of an interest, claim, privilege or possession. Its signification varies according to the branch of the law in which it is employed, but the more important uses of the word are summarized below.

ABANDONMENT OF AN ACTION is the discontinuance of proceedings commenced in the High Court of Justice either because

the plaintiff is convinced that he will not succeed in his action or for other reasons. Previous to the Judicature Act of 1875, considerable latitude was allowed as to the time when a suitor might abandon his action, and yet preserve his right to bring another action on the same suit; but since 1875 this right has been considerably curtailed, and a plaintiff who has delivered his reply, and afterwards wishes to abandon his action, can generally obtain leave so to do only on condition of bringing no further proceedings in the matter. (See PRACTICE and PROCEDURE.)

ABANDONMENT IN MARINE INSURANCE is the surrender of the ship or goods insured to the insurers, in the case of a constructive total loss of the thing insured. For the requisites and effects of abandonment in this sense see MARINE INSURANCE.

ABANDONMENT OF WIFE AND CHILDREN is dealt with under DESERTION. For the *abandonment* of a child of any age, see the articles, CHILD, CHILDREN, PROTECTIVE LAWS and DIVORCE.

ABANDONMENT OF DOMICILE is the ceasing to reside permanently in a former domicile coupled with the intention of choosing a new domicile. The presumptions which will guide the court in deciding whether a former domicile has been abandoned or not must be inferred from the facts of each individual case. (See DOMICIL.)

ABANDONMENT OF AN EASEMENT is the relinquishment of some accommodation or right in another's land, such as right of way, free access of light and air, etc. (See EASEMENT.)

ABANO, PIETRO D' (c. 1250–c. 1316), known also as PETRUS DE APONO or APONENSIS, Italian physician and philosopher, was born at Abano in 1250 or 1246. After studying medicine and philosophy at Paris he practised at Padua. He was twice brought to trial by the Inquisition on a charge of practising magic; on the first occasion he was acquitted, and he died before the second trial was completed. His best known works, in which he advocates the systems of Averroes and other Arabian writers, are the *Conciliator differentiarum quae inter philosophos et medicos versantur* (Mantua, 1472; Venice, 1476); and *De venenis eorumque remediis* (1472; French trans. Lyons, 1593).

ABANO TERME, a town in the province of Padua, Italy, on the eastern slope of Monti Euganei, 6m. S.W. by rail of Padua. Pop. (1921) 948 (town), 6,100 (commune). Its popular hot springs and mud baths were known to the Romans as *Aponi fons* or *Aquae Patavinae*. Ancient remains have been found. The Italian *Comando Supremo* was fixed here from Jan. 1918 to the signing of the Armistice, Nov. 3, in the local Villa Giusti.

ABANTES, the traditional name of the ancient inhabitants of Euboea, to whom was also ascribed the building of the town of Abae in Phocis.

ABARBANEL: see ABRABANEL.

ABATED, an obsolescent technical term applied in masonry and metal work to portions sunk beneath the general surface, as in panels where the background is sunk so as to leave letters or ornament in relief.

ABATEMENT, a beating down or diminishing, a term used especially in various legal phrases.

Abatement of a nuisance is the remedy of destroying or removing, allowed by law to a person or public authority injured by a public nuisance, provided no breach of the peace is committed in doing so. In the case of private nuisances abatement is also allowed provided there be no breach of the peace, and no damage be occasioned beyond what the removal of the nuisance requires (see NUISANCE).

Abatement of freehold takes place where, after the death of the person last seised, a stranger enters upon lands before the entry of the heir or devisee, and keeps the latter out of possession. It differs from intrusion, which is a similar entry by a stranger on the death of a tenant for life, to the prejudice of the reversioner, or remainder man; and from disseisin, which is the forcible or fraudulent expulsion of a person seised of the freehold (see FREEHOLD).

Abatement of debts and legacies.—When the assets of a deceased person are not sufficient to satisfy fully all the various creditors, their debts must abate proportionately, and they must accept a dividend. Also, in the case of legacies, when the

funds or assets out of which they are payable are not sufficient to pay them in full, the legacies abate in proportion, unless there is a priority given specially to any particular legacy (see LEGACY). Annuities are subject to the same rule as general legacies.

Abatement in pleading, or plea in abatement, was directed to defeating or quashing a particular action by some matter, such as a defect in form or the personal incompetency of the parties suing, pleaded by the defendant. All pleas in abatement are now abolished (Rules of the Supreme Court Order 21). In criminal proceedings the plea in abatement was nullified by the Criminal Law act, 1826, which required the court to amend according to the truth, and the Criminal Procedure act, 1851, which rendered description of the defendant unnecessary.

Abatement in litigation.—In civil proceedings, no action abates by reason of the marriage, death or bankruptcy of any of the parties, if the cause of action survives or continues, and does not become defective by the assignment, creation or devolution of any estate or title *pendente lite* (R.S.C. Order 17). Criminal proceedings do not abate on the death of the prosecutor, being in theory instituted by the Crown, but the Crown itself may bring about their termination without any decision on the merits and without the assent of the prosecutor.

Abatement in heraldry is a badge in coat-armour, indicating some kind of degradation or dishonour. It is called also *rebatement*.

Abatement in taxation.—A reduction in assessment to taxation or in rate of tax, which is made to remove anomalies, mitigate hardship or refine a scale of duties. Abatements have long been a special feature of the British income-tax system. For many years a rough-and-ready graduated income-tax was formed by imposing a fixed poundage rate upon all incomes of whatever size, and providing in the Finance Act for (1) the total exemption of very small incomes and (2) the reduction or "abatement" of the assessments made upon incomes above the exemption limit and not exceeding certain moderate amounts. This abatement system has been swept away, but abatements of assessment to mitigate rate of tax are still made in respect of the maintenance of wife and young children and the payment of a life insurance premium. See INCOME TAX.

In the United States abatement of State and local taxation is governed solely by statute, and the laws of the various States and the court decisions thereunder should therefore be consulted for specific information on this subject. Abatement of Federal taxation is likewise purely statutory; and the question is governed exclusively by numerous Acts of Congress, including Section 3220 of the Revised Statutes (as amended) and the various Federal revenue acts together with the regulations thereon. (See TAXATION.)

ABATI (ah-bah'tē), **NICCOLO** or DELL' ABBATO (1512–1571), a celebrated fresco-painter of Modena, whose best works are there and at Bologna. He accompanied Primaticcio to France, and assisted in decorating the palace at Fontainebleau (1552–71). A fine example of his work, representing the martyrdom of St. Peter and St. Paul, is in the Dresden Gallery.

ABATIS, **ABATTIS** or **ABBATTIS** (a French word meaning a heap of material thrown), a term in field fortification for an obstacle formed of the branches of trees laid in a row, with the tops directed towards the enemy and interlaced or tied with wire. The abatis is used alone or in combination with wire-entanglements and other obstacles.

ABATTOIR, a place in which the slaughter of animals for human food is concentrated, and in which subsidiary activities associated therewith are carried on. The term is not quite synonymous with the equivalent English word slaughter-house, which is applied indiscriminately to small private establishments in individual occupation, and to the more comprehensive buildings provided to meet the needs of a community, or of special branches of the meat industry. The latter include meat packing, the oversea trade in frozen and chilled meat, and the large scale curing of bacon and ham. The industrial abattoir differs in detail of arrangement and equipment from its municipal or communal equivalent. Well organized and intensive team work through which the animal passes rapidly from the slaughtering pen to the cooling

room as a finished dressed carcase is an essential feature in the management of the industrial abattoir. This requirement is therefore kept in view in the arrangement of the buildings as well as in the equipment with which they are furnished. The communal abattoir on the other hand must meet the needs of many individual traders, and provision must be made for individual rather than for team work.

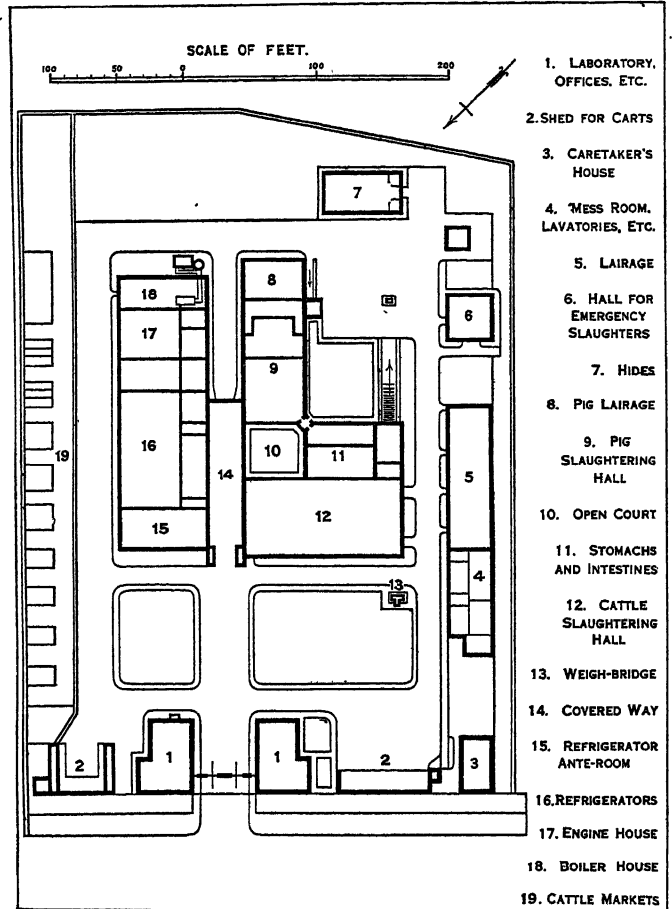

The public or communal abattoir is an important factor in the interests of public health. The slaughter of animals for human food is classified as an offensive trade in all public health legislation and it has been so classified for centuries. No matter what the conditions under which the trade is conducted, objectionable features are inseparably associated with it. The aim and purpose of an abattoir is to reduce these to a negligible minimum by the provision of a building properly constructed and equipped in which the best hygienic conditions can be maintained. Further, by concentrating the slaughter of animals for human food, the systematic examination of all carcases is rendered practicable and the rejection of those which are diseased and unsound is ensured. Incidentally, the public abattoir possesses an economic value: it affords opportunity for the profitable treatment of blood, tallow, condemned carcases and other residues.

The Private Slaughter-house.—In the provision of public abattoirs, England is remarkably behind her continental neighbours and her own colonies. There are approximately 20,000 private slaughter-houses in England and Wales and probably less than 100 public abattoirs. (Report of Departmental Commission on Meat Inspection, Ministry of Health, 1921.) In every country in which the abattoir system has been developed, experience has proved that no progress could be made until the law gave power not only to erect public abattoirs but also simultaneously to close slaughter-houses in private occupation. In the latter respect the law of England and Wales is defective. Local authorities have hesitated to exercise the power to erect public abattoirs which was conferred on them in 1848, since it is obvious that no useful purpose would be served by their establishment unless it was reasonably clear that the butchers would use the abattoirs when provided. The continued existence of many private slaughter-houses in London, Birmingham, Manchester and other large English cities which have public abattoirs is evidence of the difficulty of concentrating slaughter in the public establishment when its use is dependent on voluntary agreement between meat traders and the local sanitary authorities.

Scotland has been more progressive. In 1862 the General Police and Improvement Act empowered the commissioners of burghs to erect and maintain abattoirs and on so doing to prohibit the slaughter of cattle in the burgh or within two miles of its boundary elsewhere than in the abattoir which had been provided. With the single exception of Aberdeen, all the large towns in Scotland and the majority of the smaller burghs have provided public abattoirs and abolished private slaughter-houses.

European and American Advance.—During the greater part of the 19th century France led the way in the development of the public abattoir system. In the last quarter of the century, however, outbreaks of meat food poisoning, trichinosis and other diseases of man which were largely attributable to defective meat inspection stimulated Germany to activity and led to remarkable developments and improvements in the design and arrangement of abattoirs. Holland, Belgium and most other European countries followed suit. General laws were passed permitting or making compulsory the provision of abattoirs with the result that in these countries the public abattoir has almost entirely superseded and displaced the slaughter-house in individual occupation. Almost coincidentally with these developments in Europe, the large industrial abattoirs of the meat packing trade of the U.S.A. made their appearance, and later, when experiment had proved that the transport of frozen meat by sea to Europe was practicable and much more economical than the shipment of live cattle, the export slaughter-houses of South America, Australia and New Zealand came into existence. They were constructed on the scientific and hygienic principles, which marked the latter half of the 19th century.

The Paris abattoirs which were completed in 1818 provided a model for the design and arrangement of public slaughter-houses during a period of nearly 70 years. Many abattoirs planned on the Paris model continue in daily use in Scotland and on the continent of Europe. As time has progressed hygienic improvements have, of necessity, been introduced to bring them into line with modern requirements. This old type of abattoir comprises a series of booths arranged side by side and completely partitioned off one from another. Each booth is, in effect, the equivalent of a

BY COURTESY OF DR. BERGER

PLAN OF ABATTOIR AT TILBURG, HOLLAND

Modern abattoirs have many features designed after operating theatres in hospitals. Inner walls have smooth polished surfaces. Wall heads are built up, corners are rounded, which, with water-tight floors to facilitate cleansing, and a plentiful water supply, ensures a high standard

small individual slaughter-house. It is provided in the rear with appropriate lairage for the accommodation of animals awaiting slaughter. Sanitary and other necessary services are shared in common by the occupants of the individual booths. In comparison with the modern abattoir this arrangement is less economical and much less hygienic.

The German Model.—The first departure from the Paris model was made by Germany during the years 1875–80, and to the German architects and hygienists is due credit for the design of the modern abattoir. Their conception of the plan of an abattoir seems to have been prompted by two main motives. The first was reduction of labour, and resulted in the introduction of mechanical equipment and of overhead transporter rails to facilitate the handling and movement of carcases, etc. Incidentally, it contributed to the second and more important aim which was hygienic. Individual interests were subordinated as far as was necessary to secure the main object of safeguarding the public health. Separate booths were abolished and replaced by an open slaughter-hall in which the whole of the work of the abattoir could be maintained under continuous supervision and control. Rooms were set apart for the reception of stomachs and intestines in order that the floor of the slaughter-hall should cease to be polluted

with their contents, and healthy carcasses should no longer be exposed to the risk of contamination with these materials to the prejudice and danger of the consumer. The open hall facilitated the work of meat inspection and contributed to a higher degree of efficiency. Refrigerators were introduced to ensure safe storage and preservation of meat irrespective of climatic conditions.

Importance of Site.—The site of an abattoir should be carefully chosen. Plenty of light, proper ventilation and the free circulation of air round the buildings are primary essentials. An open situation is, therefore, desirable, but the close proximity of human habitations should always be avoided. Sewage effluents contain much solid matter and the site should permit of drainage with a good fall to secure free and continuous flow of the liquid discharges. Easily accessible railway facilities are of inestimable value in the interests of live stock and of the public, to remove from the streets an undesirable traffic which contributes to congestion. For the same reason live stock markets and the public abattoir whenever practicable should occupy adjoining sites. As a rule these conditions can be secured better and more economically on the outskirts of a town than near its centres of shopping or industry. The general arrangement of the different buildings contributes to the smooth and easy working of an abattoir. Reception of the living animals in the rear buildings and discharge of dressed carcasses from the front saves cross currents of traffic and ensures regular circulation as the work proceeds. Hides, stomachs, etc., are passed in the same direction to the apartments in which they are dealt with. Where practicable, it is a convenient and suitable arrangement to provide the appropriate receiving rooms on a lower level and to pass hides and stomachs to them by means of chutes. In the larger abattoirs separate halls are provided for the slaughter of cattle, sheep and pigs, but even in relatively small establishments, the differences of procedure make the provision of separate accommodation for the slaughter, scalding and dressing of pigs desirable. The slaughter-hall in the modern abattoir is a plain open apartment plotted out in stances but without divisions or partitions of any kind. Hand winches enable the heaviest carcasses to be raised during the process of dressing, and then transferred easily to trolleys on overhead rails.

Industrial Abattoirs.—It has already been stated that the fundamental difference between the public abattoir and the industrial abattoir associated with the export of meat, etc., is that the former must provide for individual work and the latter for team work. Whereas the slaughter-hall of the public abattoir is plotted out in stances, each of which is allotted to an individual butcher or a small gang of three or four workers who carry out the work of slaughter and dressing of the animal carcasses, the whole of the slaughter-hall of the industrial abattoir is for all practical purposes the equivalent of one large slaughtering and dressing stance. Definite stations are fixed on the stance and to each is assigned a member of a team of workers who thus constitute a chain extending from the slaughtering pen at one end to the cooling room for finished carcasses at the other. In the preparation of the carcass a specific piece of work is allotted to each worker, who performs it with the rapidity of experience and a high degree of skill. The living animal is received into the slaughtering pen and is stunned. The weight of the falling body automatically releases a simple mechanical device by means of which the carcass is ejected from the pen on to the bleeding floor. Thence it is hoisted to an overhead rail, suspended from which it is passed rapidly from station to station along the chain of workers. The hide and internal organs, as each is removed, are passed through apertures in a side wall or by means of chutes into rooms specifically provided for their reception and handling. At fixed points meat inspectors meet each carcass as it passes along and, in combination, they carry out a complete systematic examination for the detection of disease. Diseased carcasses are marked to be side-tracked from the main route which leads to the cooling rooms, and later they are subjected to more detailed examination and judgment. Diseased viscera are similarly side-tracked for destruction. By means of this team work carcasses are passed from the slaughtering pen to the cooling room at the rate of 60 to 120 per hour according to the skill of the workers and the kind of animal handled.

The subsidiary trades of the slaughter-house, to which reference has already been made, play an important rôle in the industrial abattoir. Properly conducted, they contribute in an appreciable measure to the financial success of the undertaking.

The refrigerator constitutes a vital part of the export abattoir. The nature of the trade makes ample accommodation necessary. The carcasses, having been allowed to hang till the natural body heat has been dissipated, are introduced into the freezing chambers where they are gradually completely frozen and held till ready for shipment. In the still frozen condition they are transferred rapidly and direct into the freezing chambers of the hold of the ship by which they are to be transported. During recent years material developments have taken place in the "chilled" meat trade. Meat which has been maintained in the exporting abattoir and on board ship at a temperature just above freezing point commands a better market and is preferred by the consuming public to meat which has been frozen. But time limits the possibilities of the oversea transport of chilled as against frozen meat. Experience has demonstrated that, to be successful, chilled meat must reach its market within six weeks of the date of slaughter, a fact which, unfortunately, prevents some of the British colonies from participating in this trade in the home market. (A. G.)

ABAUZIT, FIRMIN (ah-bō-zē) (1679–1767), French scholar, was born of Protestant parents at Vries, in Languedoc, Nov. 11, 1679, and died at Geneva, March 20, 1767. After the revocation of the Edict of Nantes in 1685 the family took refuge in Geneva where the boy received his education. Abauzit visited Holland and England, and was one of the earliest defenders of the discoveries of Sir Isaac Newton. He declined an offer from William III. to settle in England, also the offer of the chair of philosophy at Geneva. A sinecure as librarian to the city of Geneva provided him with leisure to pursue his multifarious studies. Rousseau praises him in his *Nouvelle Héloïse*, and Voltaire, when a visitor told him he had come to see a great man, asked if he had seen Abauzit. A collection of his writings was published at Geneva in 1770, and another in London in 1773.

Information regarding Abauzit will be found in J. Senebier's *Histoire littéraire de Genève*, Harwood's *Miscellanies*, and W. Orme's *Bibliotheca Biblica* (1824).

'ABBA 'ARIKA, the name of the Babylonian 'amora of the third century, who established at Sura the systematic study of the Rabbinic traditions which, using the Mishnah as text, led to the compilation of the Talmud. He is commonly known as Rab.

ABBADIDES, a Mohammedan dynasty which arose in Spain on the downfall of the western caliphate. The founder of the house was Abd-ul-Qāsim Mohammed, the cadi of Seville in 1023. When he died in 1042 he had created a State which, though weak in itself, was strong as compared with the little powers about it. He had made his family the recognized leaders of the Mohammedans of Arab and native Spanish descent against the Berber element, whose chief was the king of Granada. Abbad, surnamed El Motaḍḍid, his son and successor, is one of the most remarkable figures in Spanish Mohammedan history. A poet and a lover of letters, he was also a poisoner, a drinker of wine, a sceptic and treacherous to the utmost degree. He killed with his own hand one of his sons who had rebelled against him. On one occasion he trapped a number of his enemies, the Berber chiefs of the Ronda, into visiting him in the Alcazar at Seville, and got rid of them by smothering them in the hot room of a bath. It was his taste to preserve the skulls of the enemies he had killed—those of the meaner men to be used as flower-pots, while those of the princes were kept in special chests. His reign until his death on Feb. 28, 1069, was mainly spent in extending his power at the expense of his smaller neighbours, and in conflicts with his chief rival the king of Granada. After 1063 he was assailed by Fernando El Magno of Castile and Leon, who marched to the gates of Seville, and forced him to pay tribute. His son, Mohammed Abd-ul-Qāsim Abenebet—who reigned by the title of El Motamid—was the third and last of the Abbadides. He went further in patronage of literature than his father, for he chose as his favourite and prime minister the poet Ibn Ammar. He carried

on the feuds of his family with the Berbers, and in his efforts to extend his dominions could be as faithless as his father. In 1080 he brought down upon himself the vengeance of Alphonso VI. of Castile by a typical piece of flighty oriental barbarity. He had endeavoured to pay part of his tribute to the Christian king with false money. The fraud was detected by a Jew, who was one of the envoys of Alphonso. El Motamid, in a moment of folly and rage, crucified the Jew and imprisoned the Christian members of the mission. Alphonso retaliated by a destructive raid. When Alphonso took Toledo in 1085, El Motamid called in Yusef ibn Tashfin, the Almoravide (see SPAIN: History and ALMORAVIDES). During the six years which preceded his deposition in 1091, El Motamid behaved with valour on the field, but with much meanness and political folly. It was probably during this period that he surrendered his beautiful daughter Zaida to the Christian king, who made her his concubine, and is said by some authorities to have married her after she bore him a son, Sancho. In 1091 the Almoravides stormed Seville. El Motamid, who had fought bravely, was weak enough to order his sons to surrender the fortresses they still held, in order to save his own life. He died in prison in Africa in 1095.

See R. P. A. Dozy, *Histoire des Musulmans d'Espagne* (Leyden, 1861); and *Historia Abbadidarum* (*Scriptorum Arabum loci de Abbadidio*, Leyden, 1846). (D. H.)

ABBADIE, ANTOINE THOMSON D' (1810-1897), and **ARNAUD MICHEL D'** (1815-1893), travellers, were born in Dublin, of a French father and an Irish mother. The parents removed to France in 1818. In 1835 the French Academy sent Antoine on a scientific mission to Brazil, the results being published in 1873 under the title of *Observations Relatives à la physique du globe faites au Brésil et en Éthiopie*. The younger Abbadie spent some time in Algeria before the two brothers started for Abyssinia in 1837, landing at Massawa in Feb. 1838. After collecting much information on the geography, geology, archaeology and natural history of Abyssinia, the brothers returned to France in 1848.

The younger brother, Arnaud, paid another visit to Abyssinia in 1853. Antoine became involved in various controversies relating both to his geographical results and his political activities in Abyssinia. Time and the investigations of subsequent explorers have shown that Abbadie was quite trustworthy as to his facts, though wrong in his contention that the Blue Nile was the main stream. The topographical results of his explorations were published in Paris in 1860-73 in *Géodésie de l'Éthiopie*. Of the *Géographie de l'Éthiopie* (1890) only one volume has been published. *Un Catalogue raisonné de manuscrits éthiopiens* (1859) contains a description of 234 Ethiopian manuscripts collected by Antoine. He published numerous papers dealing with the geography of Abyssinia, Ethiopian coins and ancient inscriptions. His *Reconnaissances magnétiques* (1890) is an account of the magnetic observations made by him in the course of several journeys to the Red Sea and the Levant.

The general account of the travels of the two brothers was published by Arnaud in 1868 under the title of *Douze ans dans la Haute-Éthiopie*. Antoine died in 1897, and bequeathed an estate in the Pyrenees, yielding 40,000 francs a year, to the Academy of Sciences, on condition of its producing within fifty years a catalogue of half a million stars. His brother Arnaud died in 1893.

'ABBAHU, the name of a Palestinian rabbi who flourished c. 279-320. 'Abba hu encouraged the study of Greek by Jews. He is very often cited in the Talmud.

ABBA MARI (in full, Abba Mari ben Moses ben Joseph), French rabbi, was born at Lunel, near Montpellier, towards the end of the 13th century. He is also known as Yarhi from his birth-place (Heb. *Yerah*; i.e., moon, *lune*), and he further took the name Astruc, Don Astruc or En Astruc of Lunel. In Montpellier, where he lived from 1303 to 1306, he was much distressed by the prevalence of Aristotelian rationalism, which, through the medium of the works of Maimonides, threatened the authority of the Old Testament, obedience to the law, and the belief in miracles and revelation. He, therefore, in a series of letters (afterwards collected under the title *Minhat Kenaot*; i.e., "Jealousy Offering")

called upon the famous rabbi Solomon ben Adret of Barcelona to come to the aid of orthodoxy. Ben Adret, with the approval of other prominent Spanish rabbis, sent a letter to the community at Montpellier proposing to forbid the study of philosophy to those who were less than 30 years of age, and, in spite of keen opposition from the liberal section, a decree in this sense was issued by ben Adret in 1305. The result was a great schism among the Jews of Spain and southern France, and a new impulse was given to the study of philosophy by the unauthorized interference of the Spanish rabbis. On the expulsion of the Jews from France by Philip IV. in 1306, Abba Mari settled at Perpignan, where he published the letters connected with the controversy.

BIBLIOGRAPHY.—Edition of the *Minhat Kenaot* by M. L. Bislichis (Pressburg, 1838); E. Renan, *Les rabbins français*, p. 647 et seq.; Perles, *Salomo ben Abraham ben Adereth*, p. 15-54; *Jewish Encyclopedia*, s.v. "Abba Mari."

'ABBAS I. (c. 1557-1628 or 1629), shah of Persia, called the Great, was the son of Shah Mohammed (d. 1586). In the midst of general anarchy in Persia, he was proclaimed ruler of Khurāsān, and became shah in 1586. Determined to raise the fallen fortunes of his country, he first directed his efforts against the predatory Uzbeks, who occupied and harassed Khurāsān. After a long struggle, he regained Meshed, defeated them in a great battle near Herat in 1597, and drove them out of his dominions. In the wars he carried on with the Turks during nearly the whole of his reign, he acquired, or regained, a large extent of territory.

By the victory he gained at Basra in 1605 he extended his empire beyond the Euphrates; Sultan Ahmed I. was forced to cede Shirvan and Kurdistan in 1611; the united armies of the Turks and Tatars were completely defeated near Sultanieh in 1618, and 'Abbas made peace on very favourable terms; and on the Turks renewing the war, Baghdad fell into his hands after a year's siege in 1623. In 1622 he took the island of Ormuz from the Portuguese, by the assistance of the British, and much of its trade was diverted to the town of Bander-Abbāsi, which was named after the shah. When he died (Jan. 27, 1628) his dominions reached from the Tigris to the Indus. Abbas distinguished himself, not only by his successes in arms, and by the magnificence of his court and of the buildings which he erected, but also by his reforms in the administration of his kingdom.

He encouraged commerce by constructing highways and building bridges. To foreigners, especially Christians, he showed a spirit of tolerance; two Englishmen, Sir Anthony and Sir Robert Shirley, or Sherley, were admitted to his confidence. His fame is tarnished by numerous deeds of tyranny and cruelty. His own family, especially, suffered from his fits of jealousy; his eldest son was slain, and the eyes of his other children were put out, by his orders.

BIBLIOGRAPHY.—See *The Three Brothers, or Travels of Sir Anthony, Sir Robert Sherley*, etc. (1825); Sir C. R. Markham, *General Sketch of the History of Persia* (1874).

ABBAS I. (1813-1854), pasha of Egypt, was a son of Tusun Pasha and grandson of Mohammed Ali. As a young man he fought in Syria under Ibrahim Pasha (q.v.), his real or supposed uncle. The death of Ibrahim in Nov. 1848 made Abbas regent of Egypt, and in Aug. 1849 following, just before the death of Mohammed Ali, Abbas succeeded to the pashalik. He was a reactionary, cruel, morose and taciturn, and spent nearly all his time shut up in his palace. He undid, as far as lay in his power, the works of his grandfather, good and bad. Among other things he abolished trade monopolies, closed factories and schools, and reduced the strength of the army to 9,000 men. At the instance of the British Government he allowed the construction of a railway from Alexandria to Cairo. On July 13, 1854, he was murdered in Benha palace by two of his slaves.

ABBAS II. (1874-), khedive of Egypt. Abbas Hilmi Pasha, great-great-grandson of Mohammed Ali, born on July 14, 1874, succeeded his father, Tewfik Pasha, as khedive of Egypt on Jan. 8, 1892. He was still studying in Vienna when the sudden death of his father raised him to the khedivate; and he was barely of age according to the Turkish law of succession. For some time he did not co-operate very cordially with Great Britain. He vis-

ited England in 1900, when he declared himself ready to co-operate with the British officials administering Egyptian affairs. He interested himself in the establishment of a sound system of native justice, the great remission of taxation, the reconquest of the Sudan, the inauguration of the irrigation works at Aswan, the increase of education and especially in farming and stock-raising. On Dec. 18, 1914, a British protectorate over Egypt was declared, and on Dec. 19 Abbas Hilmi was deposed in favour of Hussein Kâmil (1854-1917). By the rescript of April 13, 1922, establishing the law of succession the ex-khedive was definitely excluded from the succession, though without prejudice to any rights of his direct and lawful male descendants.

See Lord Cromer, *Abbas II.* (1915).

ABBASIDS, the name generally given to the second of the two great dynasties of the Mohammedan empire. The Abbasid caliphs based their claim on their descent from Abbas (A.D. 566-652), the eldest uncle of Mohammed, and regarded themselves as the true heirs of the Prophet as opposed to the descendants of Omayya. Throughout the second period of the Omayyads, representatives of this family were among their most dangerous opponents. In the reign of Merwan II. this opposition culminated in the rebellion of Ibrahim the Imam who achieved considerable success, but was captured (A.D. 747) and died in prison. The quarrel was taken up by his brother Abdallah, who after a decisive victory on the Greater Zab (750) finally crushed the Omayyads and was proclaimed caliph.

The new dynasty encouraged the development of luxury and the liberal arts. The reigns of Harun al-Rashid (786-809) and Mamun (813-833) at Baghdad were periods of extraordinary splendour. But the empire as a whole stagnated and then decayed. Independent monarchs established themselves in Africa and Khū-rāsān. The ruin of the dynasty came, however, from those Turkish slaves who were constituted as a royal bodyguard by Moqtasim (833-842). Their power grew until Radi (934-941) was constrained to hand over most of the royal functions to Mohammed b. Raik. Province after province renounced the authority of the caliphs, who were merely lay figures, and finally Khulagu, the Tatar chief, burned Baghdad (Feb. 28, 1258). The Abbasids still maintained a feeble show of authority, confined to religious matters, in Egypt under the Mamelukes, but the dynasty finally disappeared when Motawakkil III. was carried as a prisoner to Constantinople by Selim I. (See CALIPHATE.)

'ABBAS MIRZA (1783-1833), Persian prince, was a younger son of Feth Ali, shah of Persia, and was nominated to succeed him. But he predeceased his father and the succession fell to his son, Mohammed Mirza. 'Abbas Mirza conducted many campaigns against Russia between 1800 and 1813 when, by the Treaty of Gulistan, Georgia and other provinces were ceded to Russia. In 1826-28 he and his son were again campaigning against Russia, again with no final success, for the khanates of Erivan and Nakhichevan were ceded to Russia. In the interval of the Russian wars he fought against the Turks, winning a complete victory near Erzerum in 1821. After the final peace with Russia 'Abbas Mirza set about the reorganization of the province of Khū-rāsān and died at Meshed in Dec. 1833. Although 'Abbas was unsuccessful in the wars against Russia, he displayed great skill as a general, and learned something from the European soldiers who helped him to reorganize his army. He was cultivated and intelligent, and lived more simply than was the custom with the Persian royal house.

ABBAS-TUMAN, a spa in the Georgian S.S.R. (41° 44' N., 42° 46' E.). Its hot sulphur springs (93½°-118½° F.) and astronomical observatory (4,240ft.) are noted. Pop. (1926) 1,243.

ABBAYE, the name given to a group of French writers, painters and musicians who, in 1906, formed a community at Créteil, where they set up a printing press and published their works. Their number included Roger Allard, René Arcos, Henri Barzun, Albert Doyen, Georges Duhamel, Jules Romains, Charles Vildrac, etc.

ABBZIA, province of Fiume, Italy, 56m. S.E. of Trieste by rail. Pop. (1921), 2,479 (town), 5,062 (commune, which is called Volosca-Abbazia). It is on the Gulf of Quarnero at the

foot of the Monte Maggiore (4,580ft.), sheltered and surrounded by laurel woods. The average temperature is 50°F. (winter), and 77°F. (summer). The old abbey, San Giacomo al Palo, whence the town's name, is now a villa. Abbazia used to have 50,000 visitors per annum. The whole sea-coast to the north and south is rocky and picturesque.

ABBE, CLEVELAND (1838-1916), American meteorologist and astronomer, was born in New York city on Dec. 3, 1838. His training as astronomer under B. A. Gould, Brünnow and Struve (Pulkova, 1865-66) and work at the U.S. Naval observatory developed his interest in weather changes. As director of the Cincinnati observatory, 1869-73, he demonstrated the practicability of weather forecasts based on daily telegraphic synoptic charts, and in 1870 joined the U.S. signal corps to organize and direct its weather forecasts. When this greatly expanded service was transferred to the Department of Agriculture in 1891, he went as senior professor of meteorology. Abbe was often and justly called the "father of the weather bureau." *The Monthly Weather Review*, which he edited, and the introduction of the system of standard time, were both due to his initiative.

Among his works are: *Report on Standard Time* (1879); *Mechanics of the Earth's Atmosphere* (1892-1910); *Preparatory Studies for Deductive Methods* (1890); *Relation between Climate and Crops* (1901); *Physical Basis of Long-range Forecasting* (1902).

ABBE, ERNST (1840-1905), German physicist, was born in Eisenach, Thuringia, Jan. 23, 1840. He was educated at Göttingen and Jena. In 1863 he became an instructor, and in 1870 was made a professor, in the University of Jena, at which in 1878 he was appointed director of the astronomical and meteorological observatories. In 1866 he became connected with the optical works of Carl Zeiss, was made a partner in 1875, and contributed in a very large degree through his experiments to the excellence of the instruments and lenses made by the firm. In 1884, with Zeiss and Schott, he established important works for the production of technical glass. Upon the death of Zeiss in 1888 he became the sole owner of the Zeiss optical works, which he reorganized as a co-operative establishment in the profits from which the officials, the workmen and the university participated. He invented the Abbe refractometer and made many improvements in microscopic and photographic lenses. His *Gesammelte Abhandlungen* were published in 1903-06. He died in Jena, Jan. 14, 1905.

See F. Auersbach, *Ernst Abbe* (1918).

ABBESS, the superior of a community of nuns. The mode of election, position, rights and authority of an abbess correspond generally with those of an abbot (*q.v.*); but she cannot exercise priestly functions. An abbess is elected by the secret votes of the sisters, installed solemnly by episcopal benediction, and has the abbatial cross, staff and ring; she holds office usually for life. The Council of Trent fixed the qualifying age at forty, with eight years of profession. In England abbesses attended ecclesiastical councils, *e.g.*, that of Becanfield in 694, where they signed before the presbyters.

Abbesses presided over many of the early joint-houses of monks and nuns, *e.g.*, at Whitby; and later the whole "double" order of Fontevraud (founded *c.* 1100) was governed by an abbess.

In the German Evangelical Church the title of abbess (*Aebtissin*) has survived for the heads of abbeys which since the Reformation have continued as *Stifter*, *i.e.*, collegiate foundations for the maintenance of unmarried ladies, generally of noble birth, called *Stiftsdamen*.

ABBEVILLE, a city in the western part of South Carolina, U.S.A., 20m. from the Savannah river; the county seat of Abbeville county. It is served by the Seaboard Air Line and the Southern railways. The population was 4,570 in 1920 (39% negroes), and was 4,414 by the Federal census in 1930. Cotton, tobacco and poultry are raised in this region, and clay is mined near the city. There are cotton-mills operating nearly 30,000 spindles. Abbeville was settled about 1710 and incorporated in 1840.

ABBEVILLE, a town of northern France, the capital of an arrondissement, department of Somme, on the Somme, 12m. from the English channel, and 28m. N.W. of Amiens on the Northern railway. Pop. (1926) 19,125. It is built partly on an island and

partly on both sides of the river, which is canalized from this point to the estuary. The tradition of settlement extends from the Palaeolithic through the late Bronze Age (when the area was very important).

Abbeville, chief town of Ponthieu, belonged in the 9th century to the abbey of St. Riquier, and afterwards to the counts of Ponthieu. It passed to the Alençon and other French families, and afterwards to the house of Castille, from whom by marriage it went to Edward I. of England. French and English ruled it

THE CHURCH OF ST. VULFRAN, ONE OF THE MOST REMARKABLE OF THE SEVERAL OLD CHURCHES OF ABBEVILLE. DATES FROM THE 15TH CENTURY

by turns till 1435 when it was ceded to the duke of Burgundy. In 1477 it was annexed by Louis XI., and held by branches of the family until it was reunited to the Crown in 1696. The streets are narrow and present an almost mediaeval appearance. The church of St. Vulfran, erected in the 15th, 16th and 17th centuries, was not entirely completed. The façade is a magnificent specimen of flamboyant Gothic flanked by two Gothic towers. Abbeville has other old churches and an hôtel de ville, with a belfry of the 13th century. Among the old houses, the Maison de François I. dates from the 16th century. Situated on one of the main entries into France it became a great British base during the World War. Abbeville is an industrial centre; in addition to its old-established manufacture of cloth, hemp-spinning, sugar-making, shipbuilding and locksmiths' work are carried on; there is active commerce in grain, but the port has little trade. It has a tribunal of commerce and a board of trade-arbitrators.

ABBEY, EDWIN AUSTIN (1852-1911), American painter, was born at Philadelphia April 1, 1852. He left the schools of the Pennsylvania Academy of Fine Arts at the age of 19 to enter the art department of the publishing house of Harper and Brothers in New York, where, in company with such men as Howard Pyle, Charles Stanley Reinhart, Joseph Pennell and Alfred Parsons, he became very successful as an illustrator. In 1878 he was sent by the Harpers to England to gather material for illustrations of the poems of Robert Herrick. These, pub-

lished in 1882, attracted much attention, and were followed by illustrations for Goldsmith's *She Stoops to Conquer* (1887), for a volume of *Old Songs* (1889), and for the comedies (and a few of the tragedies) of Shakespeare. His water-colours and pastels were no less successful than the earlier illustrations in pen and ink. Abbey now became closely identified with the art life of England, and was elected to the Royal Institute of Painters in Water-Colours in 1883. Among his water-colours are "The Evil Eye" (1877); "The Rose in October" (1879); "An Old Song" (1886); "The Visitors" (1890), and "The Jongleur" (1892). Possibly his best-known pastels are "Beatrice," "Phyllis," and "Two Noble Kinsmen." In 1890 he made his first appearance with an oil painting, "A May Day Morn," at the Royal Academy in London. He exhibited "Richard duke of Gloucester and the Lady Anne" at the Royal Academy in 1896, and in that year was elected A.R.A., becoming a full R.A. in 1898. Apart from his other paintings, special mention must be made of the large frescoes entitled "The Quest of the Holy Grail," in the Boston Public Library, on which he was occupied for some years; and in 1901 he was commissioned by King Edward VII. to paint a picture of the coronation, containing many portraits elaborately grouped. The dramatic subjects, and the brilliant colouring of his oil pictures, gave them pronounced individuality among the works of contemporary painters. Abbey became a member not only of the Royal Academy, but also of the National Academy of Design of New York, and honorary member of the Royal Bavarian Society, the Société Nationale des Beaux Arts (Paris), the American Water-Colour Society, etc. He received first-class gold medals at the International Art Exhibition of Vienna in 1898, at Philadelphia in 1898, at the Paris Exhibitions of 1889 and 1900, and at Berlin in 1903; and was made a chevalier of the French Legion of Honour.

The last years of his life were devoted to mural paintings for the capitol at Harrisburg, Pa. Of these he undertook three, one for the House of Representatives, another for the Senate Chamber and the third for the ceiling of the dome. In 1910 there was completed under his supervision the decoration of the Peers' corridor of the Houses of Parliament at Westminster. He is represented by work at the Metropolitan Museum of Art in New York, the Boston Museum of Fine Arts and the National Gallery, London. He died in London on Aug. 1, 1911.

ABBEY, a monastery, or conventual establishment, under the government of an ABBOT or an ABBESS (Lat. *abbatia*; from Syr. *abba*, father).

The earliest Christian monastic communities (*see* MONASTICISM) with which we are acquainted consisted of groups of cells or huts collected about a common centre, which was usually the abode of some anchorite celebrated for superior holiness or singular asceticism. The formation of such communities in the East precedes Christianity, the example having been already set by the Essenes in Judea and the Therapeutae in Egypt.

In the earliest age of Christian monasticism the ascetics were accustomed to live singly, independent of one another, at no great distance from some village, supporting themselves by the labour of their own hands, and distributing to the poor the surplus after the supply of their own scanty wants. Increasing religious fervour, aided by persecution, drove them farther and farther away from the abodes of men into mountain solitudes or lonely deserts. The deserts of Egypt swarmed with the "cells" or huts of these anchorites. Anthony, who had retired to the Egyptian Thebaid during the persecution of Maximin, A.D. 312, was the most celebrated among them for his austerities, his sanctity, and his power as an exorcist. His fame collected round him a host of followers, emulous of his sanctity. The deeper he withdrew into the wilderness the more numerous his disciples became. They refused to be separated from him, and built their cells round that of their spiritual father. Thus arose the first monastic community, consisting of anchorites living each in his own little dwelling, united together under one superior. By degrees order was introduced in the groups of huts. They were arranged in lines like the tents in an encampment, or the houses in a street. From this arrangement these lines of single cells came to be known as

Laurae, *Λαῦραι*, "streets" or "lanes." The real founder of coenobian (*κοινὸς*, common, and *βίος*, life) monasteries in the modern sense was Pachomius, an Egyptian of the beginning of the 4th century. The first community established by him was at Tabennae, an island of the Nile in Upper Egypt. Eight others were founded in his lifetime, numbering 3,000 monks. Within 50 years from his death his societies could reckon 50,000 members. These coenobia resembled villages peopled by a hard-working religious community, all of one sex. The buildings were detached, small, and of the humblest character. The coenobia of Syria belonged to the Pachomian institution. We learn many details concerning those in the vicinity of Antioch from Chrysostom's writings. The monks lived in separate huts, *καλύβια*, forming a religious hamlet on the mountain side. They were subject to an abbot, and observed a common rule. (They had no refectory, but ate their common meal, of bread and water only, when the day's labour was over, reclining on strewn grass, sometimes out of doors.) Four times in the day they joined in prayers and psalms.

The necessity for defence from hostile attacks, economy of space, and convenience of access from one part of the community to another, by degrees dictated a more compact and orderly arrangement of the buildings of a monastic coenobium. Large piles of building were erected, with strong outside walls, capable of resisting the assaults of an enemy, within which all the necessary edifices were ranged round one or more open courts, usually surrounded with cloisters. The usual Eastern arrangement is exemplified in the plan of the convent of Santa Laura, Mount Athos (*Laura*, the designation of a monastery generally, being converted into a female saint).

This monastery, like the oriental monasteries generally, is surrounded by a strong and lofty blank stone wall, enclosing an area of between 3 and 4 acres. The longer side extends to a length of about 500ft. There is only one main entrance, on the north side (A), defended by three separate iron doors. Near the entrance is a large tower (M), a constant feature in the monasteries of the Levant. There is a small postern gate at L. The *enciente* comprises two large open courts, surrounded with buildings connected with cloister galleries of wood or stone. The outer court, which is much the larger, contains the granaries and storehouses (K), and the kitchen (H) and other offices connected with the refectory (G). Immediately adjacent to the gateway is a two-storied guest-house, opening from a cloister (C). The inner court is surrounded by a cloister (EE), from which open the monks' cells (II). In the centre of this court stands the catholic or conventual church, a square building with an apse of the cruciform domical Byzantine type. In front of the church stands a marble fountain (F), covered by a dome supported on columns. Opening from the western side of the cloister, but actually standing in the outer court, is the refectory (G), a large cruciform building, about 100ft. each way, decorated within with frescoes of saints. At the upper end is a semi-circular recess, in which is placed the seat of the *hegumenos* or abbot. This apartment is chiefly used as a hall of meeting, the oriental monks usually taking their meals in their separate cells.

Benedictine.—Monasticism in the West owes its extension and development to Benedict of Nursia (born A.D. 480). His rule was diffused with miraculous rapidity from the parent foundation

on Monte Cassino through the whole of western Europe, and every country witnessed the erection of monasteries far exceeding anything that had yet been seen in spaciousness and splendour. Few great towns in Italy were without their Benedictine convent, and they quickly rose in all the great centres of population in England, France, and Spain. The number of these monasteries founded between A.D. 520 and 700 is amazing. Before the Council of Constance, A.D. 1415, no fewer than 15,070 abbeys had been established of this order alone. The buildings of a Benedictine abbey were uniformly arranged after one plan, modified where necessary (as at Durham and Worcester, where the monasteries stand close to the steep bank of a river) to accommodate the arrangement to local circumstances (*see* BENEDICTINES). We

have no existing examples of the earlier monasteries of the Benedictine order. But we have fortunately preserved to us an elaborate plan of the great Swiss monastery of St. Gall, erected about A.D. 820, which puts us in possession of the whole arrangements of a monastery of the first class towards the early part of the 9th century. This curious and interesting plan has been made the

subject of a memoir both by Keller (Zürich, 1844) and by Professor Robert Willis (*Arch. Journal*, 1848, vol. v., pp. 86-117). To the latter we are indebted for the substance of the following description, as well as for the plan, reduced from his elucidated transcript of the original preserved in the archives of the convent. The general appearance of the convent is that of a town of isolated houses with streets running between them. It is evidently planned in compliance with the Benedictine rule, which enjoined that, if possible, the monastery should contain within itself every necessary of life, as well as the buildings more intimately connected with the religious and social life of its inmates. It should comprise a mill, a bakehouse, stables, and cow-houses, together with accommodation for carrying on all necessary mechanical arts within the walls, so as to obviate the necessity of the monks going outside its limits.

The general distribution of the buildings may be thus described. The church, with its cloister to the south, occupies the centre of a quadrangular area, about 430ft. square. The buildings, as in all great monasteries, are distributed into groups. The church forms the nucleus, as the centre of the religious life of the community. In closest connection with the church is the group of buildings appropriated to the monastic life and its daily requirements—the refectory for eating, the dormitory for sleeping, the common room for social intercourse, the chapter-house for religious and disciplinary conference. These essential elements of monastic life are ranged about a cloister court, surrounded by a covered arcade, affording communication sheltered from the elements between the various buildings. The infirmary for sick monks, with the physician's house and physic garden, lies to the east. In the same group with the infirmary is the school for the novices. The outer school, with its headmaster's house against the opposite wall of the church, stands outside the convent enclosure, in close proximity to the abbot's house, that he might have a constant eye over them. The buildings devoted to hospitality are divided into three groups—one for the reception of distinguished guests, another for monks visiting the monastery, a third for poor travellers and pilgrims. The first and third are placed to the right and left of the common entrance of the monastery—the hospitium for distinguished guests being placed on the north side of the church, not far from the abbot's house; that for the poor on the south side next to the farm buildings. The monks are lodged in a guest-house built against the north wall of the church. The group of buildings connected with the material wants of the establishment is placed to the south and west of the church, and is distinctly separated from the monastic buildings. The kitchen, buttery, and offices are reached by a passage from the west end of the refectory and connected with the bakehouse and brewhouse, which are placed still farther away. The whole of the southern and western sides is devoted to workshops, stables and farm-buildings. The buildings, with some exceptions, seem to have been of one storey only, and all but the church were probably erected of wood.

Canterbury Cathedral.—A curious bird's-eye view of Canterbury cathedral and its annexed conventual buildings, taken about 1165, is preserved in the Great Psalter in the library of Trinity college, Cambridge. As elucidated by Prof. Willis,¹ it exhibits the plan of a great Benedictine monastery in the 12th century, and enables us to compare it with that of the 9th as seen at St. Gall. We see in both the same general principles of arrangement, which indeed belong to all Benedictine monasteries, enabling us to determine with precision the disposition of the various buildings, when little more than fragments of the walls exist. From some local reasons, however, the cloister and monastic buildings are placed on the north, instead, as is far more commonly the case, on the south of the church. There is also a separate chapter-house, which is wanting at St. Gall.

The buildings at Canterbury, as at St. Gall, form separate groups. The church forms the nucleus. In immediate contact with this, on the north side, lie the cloister and the group of

buildings devoted to the monastic life. Outside of these, to the west and east, are the "halls and chambers devoted to the exercise of hospitality, with which every monastery was provided, for the purpose of receiving as guests persons who visited it, whether clergy or laity, travellers, pilgrims, or paupers." To the north a large open court divides the monastic from the menial buildings, intentionally placed as remote as possible from the con-

cloister lay to the south-east of the larger cloister, and still farther to the east the remains of the infirmary with the *table hall*, the refectory of those who were able to leave their chambers. The abbot's house formed a small courtyard at the west entrance, close to the inner gateway. Considerable portions of this remain, including the abbot's parlour, celebrated as "the Jerusalem Chamber," his hall, now used for the Westminster king's scholars, and the kitchen and butteries beyond.

Cluny.—The history of monasticism is one of alternate periods of decay and revival. With growth in popular esteem came increase in material wealth, leading to luxury and worldliness. The first religious ardour cooled, the strictness of the rule was relaxed, until by the 10th century the decay of discipline was so complete in France that the monks are said to have been frequently unacquainted with the rule of St. Benedict, and even ignorant that they were bound by any rule at all. The reformation of abuses generally took the form of the establishment of new monastic orders, with new and more stringent rules, requiring a modification of the architectural arrangements. One of the earliest of these reformed orders was the *Cluniac*, taking its name from the little village of Cluny, 12m. N.W. of Mâcon, near which, about A.D. 909, a reformed Benedictine abbey was founded by William, duke of Aquitaine and count of Auvergne, under Berno, abbot of Beaume. He was succeeded by Odo, who is often regarded as the founder of the order. The fame of Cluny spread far and wide. Its rigid rule was adopted by a vast number of the old Benedictine abbeys, who placed themselves in affiliation to the mother society, while new foundations sprang up in large numbers, all owing allegiance to the "archabbot," established at Cluny. By the end of the 12th century the number of monasteries affiliated to Cluny in the various countries of western Europe amounted to 2,000. The monastic establishment of Cluny was one of the most extensive and magnificent in France. We may form some idea of its enormous dimensions from the fact recorded, that, when, A.D. 1245, Pope Innocent IV., accompanied

¹The *Architectural History of the Conventual Buildings of the Monastery of Christ Church in Canterbury*. By the Rev. Robert Willis. Printed for the Kent Archaeological Society, 1869.

by twelve cardinals, a patriarch, three archbishops, the two generals of the Carthusians and Cistercians, the king (St. Louis), and three of his sons, the queen mother, Baldwin, count of Flanders and emperor of Constantinople, the duke of Burgundy, and six lords, visited the abbey, the whole party, with their attendants, were lodged within the monastery without disarranging the monks, 400 in number. Nearly the whole of the abbey buildings, including the magnificent church, were swept away at the close of the 18th century. When the annexed ground-plan was taken, shortly before its destruction, nearly all the monastery, with the exception of the church, had been rebuilt.

The church, the ground-plan of which bears a remarkable resemblance to that of Lincoln cathedral, was of vast dimensions. It was 656ft. by 130ft. wide. The nave was 102ft. and the aisles 60ft. high. The nave (G) had double vaulted aisles on either side. Like Lincoln, it had an eastern as well as a western transept, each furnished with apsidal chapels to the east. The western transept was 213ft. long, and the eastern 123ft. The choir terminated in a semicircular apse (F), surrounded by five chapels, also semicircular. The western entrance was approached by an ante-church, or *narthex* (B), itself an aisled church of no mean dimensions, flanked by two towers, rising from a flight of steps bearing a stone cross. The first English house of the Cluniac order was that of Lewes, founded by the earl of Warren, c. A.D. 1077. Of this only a few fragments of the domestic buildings exist. The best preserved Cluniac houses in England are Castle Acre, Norfolk, and Wenlock, Shropshire.

The Cluniac revival, with all its brilliancy, was but short-lived. The celebrity of this, as of other orders, worked its moral ruin. With their growth in wealth and dignity the Cluniac foundations became as worldly in life and as relaxed in discipline as their predecessors, and a fresh reform was needed.

Cistercian.—The next great monastic revival, the Cistercian, arising in the last years of the 11th century, had a wider diffusion, and a longer and more honourable existence. The rapid growth and wide celebrity of the order are undoubtedly to be attributed to the enthusiastic piety of St. Bernard, abbot of the first of the monastic colonies, subsequently sent forth in such quick succession by the first Cistercian houses, the far-famed abbey of Clairvaux, A.D. 1116. The rigid self-abnegation, which was the ruling principle of this reformed congregation of the Benedictine order, extended itself to the churches and other buildings erected by them. The characteristic of the Cistercian abbeys was the extremest simplicity and a studied plainness. Only one tower—a central one—was permitted, and that was to be very low. Unnecessary pinnacles and turrets were prohibited. The windows were to be plain and undivided, and it was forbidden to decorate them with stained glass. All needless ornament was proscribed. The crosses must be of wood; the candlesticks of iron. The renunciation of the world was to be evidenced in all that met the eye. The same spirit manifested itself in the choice of the sites of their monasteries. The more dismal, the more hopeless a spot appeared, the more did it please their rigid mood. But they came not merely as ascetics, but as improvers. The Cistercian monasteries are, as a rule, found placed in deep well-watered valleys. They always stand on the border of a stream; not rarely, as at Fountains, the buildings extend over it. These valleys, now so rich and productive, wore a very different aspect when the brethren first chose them as the place of their retirement. Wide swamps, deep morasses, tangled thickets, wild impassable forests, were their prevailing features. The "bright valley," *Clara Vallis* of St. Bernard, was known as the "valley of Wormwood," infamous as a den of robbers.

All Cistercian monasteries, unless the circumstances of the locality forbade it, were arranged according to one plan. The general arrangement and distribution of the various buildings which went to make up one of these vast establishments may be gathered from that of St. Bernard's own abbey of Clairvaux, which is here given. It will be observed that the abbey precincts are surrounded by a strong wall, furnished at intervals with watch-towers and other defensive works. The wall is nearly encircled by a stream of water, artificially diverted from the

small rivulets which flow through the precincts, furnishing the establishment with an abundant supply in every part, for the irrigation of the gardens and orchards, the sanitary requirements of the brotherhood and for the use of the offices and workshops.

The precincts are divided across the centre by a wall, running from north to south, into an outer and inner ward—the former containing the menial, the latter the monastic buildings. The pre-

were placed, without any regard to symmetry, convenience being the only consideration. Advancing eastwards, we have before us the wall separating the outer and inner ward, and the gate-house (D) affording communication between the two. On passing through the gateway, the outer court of the inner ward was entered, with the western façade of the monastic church in front. Immediately on the right of the entrance was the abbot's house (G), in close proximity to the guest-house (F). On the other side of the court were the stables, for the accommodation of the horses of the guests and their attendants (H). The church occupied a central position. To the south was the great cloister (A), surrounded by the chief monastic buildings, and farther to

of the Cistercian houses allows us to accept this as a type of the monasteries of this order. The church (A) is the chief feature. It consists of a vast nave of eleven bays, entered by a narthex, with a transept and short apsidal choir. (It may be remarked that the eastern limb in all unaltered Cistercian churches is remarkably short, and usually square.) To the east of each limb of the transept are two square chapels, divided according to Cistercian rule by solid walls. Nine radiating chapels, similarly divided, surround the apse. The stalls of the monks, forming the ritual choir, occupy the four eastern bays of the nave. There was a second range of stalls in the extreme western bays of the nave for the *fratres conversi*, or lay brothers. To the south of the church, so as to secure as much sun as possible, the cloister was invariably placed, except when local reasons forbade it. Round the cloister (B) were ranged the buildings connected with the monks' daily life. The chapter-house (C) always opened out of the east walk of the cloister in a line with the south transept. In Cistercian houses this was quadrangular, and was divided by pillars and arches into two or three aisles. Between it and the transept we find the sacristy (X), and a small book-room (Y), *armarium*, where the brothers deposited the volumes borrowed from the library. On the other side of the chapter-house, to the south, is a passage (D) communicating with the courts and buildings beyond. This was sometimes known as the *parlour*, *colloquii locus*, the monks having the privilege of conversation here. Here also, when discipline became relaxed, traders, who had the liberty of admission, were allowed to display their goods. Beyond this we often find the *calefactorium* or *day-room*—an apartment warmed by flues beneath the pavement, where the brethren, half frozen during the night offices, betook themselves after the conclusion of lauds, to gain a little warmth, grease their sandals and get themselves ready for the work of the day. In the plan before us this apartment (E) opens from the south cloister walk, adjoining the refectory. The place usually assigned to it is occupied by the vaulted substructure of the *dormitory* (Z). The *dormitory*, as a rule, was placed on the east side of the cloister, running over the *calefactorium* and *chapter-house*, and joined the south transept, where a flight of steps admitted the brethren into the church for nocturnal services. Opening out of the dormitory was always the *necessarium*, planned with the greatest regard to health and cleanliness, a water-course invariably running from end to end. The refectory opens out of the south cloister at (G). The position of the refectory is usually a marked point of difference between Benedictine and Cistercian abbeys. In the former, as at Canterbury, the refectory ran east and west parallel to the nave of the church, on the side of the cloister farthest removed from it. In the Cistercian monasteries, to keep the noise and smell of dinner still farther away from the sacred building, the refectory was built north and south, at right angles to the axis of the church. It was often divided, sometimes into two, sometimes, as here, into three aisles. Outside the refectory door, in the cloister, was the *lavatory*, where the monks washed their hands at dinner-time. The buildings belonging to the material life of the monks lay near the refectory, as far as possible from the church, to the south-west. With a distinct entrance from the outer court was the kitchen court (F), with its buttery, scullery, and larder, and the important adjunct of a stream of running water. Farther to the west, projecting beyond the line of the west front of the church, were vast vaulted apartments (SS), serving as cellars and storehouses, above which was the dormitory of the *conversi*. Detached from these, and separated entirely from the monastic buildings, were various workshops, which convenience required to be banished to the outer precincts, a saw-mill and oil-mill (UU) turned by water, and a currier's shop (V), where the sandals and leathern girdles of the monks were made and repaired.

Returning to the cloister, a vaulted passage admitted to the small cloister (I), opening from the north side of which were eight small cells, assigned to the scribes employed in copying works for the library, which was placed in the upper story, accessible by a turret staircase. To the south of the small cloister a long hall will be noticed. This was a *lecture-hall*, or

the east the smaller cloister, opening out of which were the infirmary, novices' lodgings, and quarters for the aged monks. Still farther to the east, divided from the monastic buildings by a wall, were the vegetable gardens and orchards, and tank for fish. The large fish-ponds, an indispensable adjunct to any ecclesiastical foundation, on the formation of which the monks lavished extreme care and pains, and which often remain as almost the only visible traces of these vast establishments, were placed outside the abbey walls.

Figure 5 furnishes the ground-plan of the distinctly monastic buildings on a larger scale. The usually unvarying arrangement

rather a hall for the religious disputations customary among the Cistercians. From this cloister opened the *infirmarium* (K), with its hall, chapel, cells, blood-letting house, and other dependencies. At the eastern verge of the vast group of buildings we find the *novices' lodgings* (L), with a third cloister near the novices' quarters and the original guest-house (M). Detached from the great mass of the monastic edifices was the original abbot's house (N), with its dining-hall (P). Closely adjoining this, so that the eye of the father of the whole establishment should be constantly over those who stood the most in need of his watchful care—those who were training for the monastic life, and those who had worn themselves out in its duties—was a fourth cloister (O), with annexed buildings, devoted to the aged and infirm members of the establishment. The cemetery, the last resting-place of the brethren, lay to the north side of the nave of the church (H).

It will be seen from the above account that the arrangement of a Cistercian monastery was in accordance with a clearly defined system, and admirably adapted to its purpose. The base court nearest to the outer wall contained the buildings belonging to the functions of the body as agriculturists and employers of labour. Advancing into the inner court, the buildings devoted to hospitality are found close to the entrance; while those connected with the supply of the material wants of the brethren—the kitchen, cellars, etc.—form a court of themselves outside the cloister and quite detached from the church. The church, refectory, dormitory and other buildings belonging to the professional life of the brethren, surround the great cloister. The small cloister beyond, with its scribes' cells, library, hall for disputations, etc., is the centre of the literary life of the community. The requirements of sickness and old age are carefully provided for in the infirmarium cloister and that for the aged and infirm members of the establishment. The same group contains the quarters of the novices.

The English Cistercian houses, of which there are such extensive and beautiful remains at Fountains, Rievaulx, Kirkstall, Tintern, Netley, etc., were mainly arranged after the same plan, with slight local variations.

Fountains Abbey.—Fountains abbey, first founded A.D. 1132, is one of the largest and best preserved Cistercian houses in England. Earlier buildings received considerable additions and alterations in the later period of the order, causing deviations from the strict Cistercian type. The church stands a short distance to the north of the River Skell, the buildings of the abbey stretching down to and even across the stream. We have the cloister (H) to the south, with the three-aisled chapter-house (I) and calefactory (L) opening from its eastern walk, and the refectory (S), with the kitchen (Q) and buttery (T) attached, at

right angles to its southern walk. Parallel with the western walk is an immense vaulted substructure (U), incorrectly styled the cloisters, serving as cellars and store-rooms, and supporting the dormitory of the *conversi* above. This building extended across the river. At its south-west corner were the necessities (V), also built, as usual, above the swiftly flowing stream. The monks' dormitory was in its usual position above the chapter-house, to the south of the transept. As peculiarities of arrangement may be noticed the position of the kitchen (Q), between the refectory and calefactory, and of the infirmarium (W) (unless there is some error in its designation) above the river to the west, adjoining the guest-houses (XX). We may also call attention to the greatly lengthened choir, commenced by Abbot John of York, 1203-11, and carried on by his successor, terminating, like Durham cathedral, in an eastern transept, the work of Abbot John of Kent, 1220-47, and to the tower (D), added not long before the dissolution by Abbot Hubert, 1494-1526, in a very unusual position at the northern end of the north transept. The abbot's house, the largest and most remarkable example of this class of buildings in the kingdom, stands south to the east of the church and cloister, from which it is divided by the kitchen court (K), surrounded by the ordinary domestic offices. A considerable portion of this house was erected on arches over the Skell. The size and character of this house, probably, at the time of its erection, the most spacious house of a subject in the kingdom, not a castle, bespeaks the wide departure of the Cistercian order from the stern simplicity of the original foundation. The hall (2) was one of the most spacious and magnificent apartments in mediaeval times, measuring 170ft. by 70ft. Like the hall in the castle at Winchester, and Westminster hall, as originally built, it was divided by 18 pillars and arches, with 3 aisles. Among other apartments, for the designation of which we must refer to the ground-plan, was a domestic oratory or chapel, (6) 46½ft. by 23ft. and a kitchen (7), 50ft. by 38ft.

Feudal Character.—The arrangement of the building bespeaks the powerful feudal lord, not the humble father of a body of hard-working brethren, bound by vows to a life of poverty and self-denying toil. In the words of Dean Milman, "the superior, once a man bowed to the earth with humility, care-worn, pale, emaciated, with a coarse habit bound with a cord, with naked feet, had become an abbot on his curvetting palfrey, in rich attire, with his silver cross before him, travelling to take his place amid the lordliest of the realm." (*Lat. Christ.* vol. iii. p. 330.)

The buildings of the *Austin canons* or *Black canons* (so called from the colour of their habit) present few distinctive peculiarities. This order had its first seat in England at Colchester, where a house for Austin canons was founded about A.D. 1105, and it very soon spread widely. As an order of regular clergy, holding a middle position between monks and secular canons, almost resembling a community of parish priests living under rule, they adopted naves of great length to accommodate large congregations.

The *Premonstratensian* regular canons, or White canons, had as many as 35 houses in England, of which the most perfect remaining are those of Easby, Yorkshire, and Bayham, Kent. The head house of the order in England was Welbeck. This order was a reformed branch of the Austin canons, founded, A.D. 1119, by Norbert (born at Xanten, on the Lower Rhine, c. 1080) at Prémontré, a secluded marshy valley in the forest of Coucy in the diocese of Laon. The order spread widely. Even in the founder's lifetime it possessed houses in Syria and Palestine. It long maintained its rigid austerity, till in the course of years wealth impaired its discipline, and its members sank into indolence and luxury. The Premonstratensians were brought to England shortly after A.D. 1140, and were first settled at Newhouse, in Lincolnshire, near the Humber. The ground-plan of Easby abbey, owing to its situation on the edge of the steeply-sloping banks of the Swale, is singularly irregular. The cloister is duly placed on the south side of the church, and the chief buildings occupy their usual positions round it. But the cloister garth, as at Chichester, is not rectangular, and all the surrounding buildings are thus made to sprawl in a very awkward fashion. The church

follows the plan adopted by the Austin canons in their northern abbeys, and has only one aisle to the nave—that to the north; while the choir is long, narrow and aisleless. Each transept has an aisle to the east, forming three chapels.

The church at Bayham was destitute of aisles either to nave or choir. The latter terminated in a three-sided apse. This church is remarkable for its exceeding narrowness in proportion to its length. Extending in longitudinal dimensions 257ft., it is not more than 25ft. broad. Stern Premonstratensian canons wanted

which was first adopted by St. Bruno and his twelve companions at the original institution at Chartreux, near Grenoble, was maintained in all the Carthusian establishments throughout Europe, even after the ascetic severity of the order had been to some extent relaxed, and the primitive simplicity of their buildings had been exchanged for the magnificence of decoration which characterizes such foundations as the *Certosas* of Pavia and Florence. According to the rule of St. Bruno, all the members of a Carthusian brotherhood lived in the most absolute solitude and silence. Each occupied a small detached cottage, standing by itself in a small garden surrounded by high walls and connected by a common corridor or cloister. In these cottages or cells a Carthusian monk passed his time in the strictest asceticism, only leaving his solitary dwelling to attend the services of the Church, except on certain days when the brotherhood assembled in the refectory. The peculiarity of the arrangements of a Carthusian monastery, or *charter-house*, as it was called in England, from a corruption of the French *chartreux*, is exhibited in the plan of that of Clermont, after Viollet-le-Duc.

Clermont Abbey is surrounded by a wall, furnished at intervals with watch towers (R). The enclosure is divided into two courts, of which the eastern court, surrounded by a cloister, from which the cottages of the monks (I) open, is much the larger. The two courts are divided by the main buildings of the monastery, including the church, the sanctuary (A), divided from B, the monks' choir, by a screen with two altars, the smaller cloister to the south (S) surrounded by the chapter-house (E), the refectory (X)—these buildings occupying their normal position—and the chapel of Pontgibaud (K). The kitchen with its offices (V) lies behind the refectory, accessible from the outer court without entering the cloister. To the north of the church, beyond the sacristy (L), and the side chapels (M), we find the cell of the sub-prior (A') with its garden. The lodgings of the prior (G) occupy the centre of the outer court, immediately in front of the west door of the church, and face the gateway of the convent (O). A small raised court with a fountain (C) is before it. This outer court also contains the guest-chambers (P), the stables, and lodgings of the lay brothers (N), the barns and granaries (Q), the dovecot (H), and the bakehouse (T). At Z is the prison. (In this outer court, in all the earlier foundations, as at Witham, there was a smaller church in addition to the larger church of the monks.) The outer and inner courts are connected by a long passage (F), wide enough to admit a cart laden with wood to supply the cells of the brethren with fuel. The number of cells surrounding the great cloister is 18. They are all arranged on a uniform plan. Each little dwelling contains three rooms: a sitting room (C), warmed by a stove in winter; a sleeping-room (D), furnished with a bed, a table, a bench, and a book-case; and a closet (E). Between the cell and the cloister gallery (A) is a passage or corridor (B), cutting off the inmate of the cell from all sound or movement which might interrupt his meditations. The superior had free access to this corridor, and through open niches was able to inspect the garden without being seen. At I is the hatch or turn-table, in which the daily allowance of food was deposited by a brother appointed for that purpose, affording no view either inwards or outwards. H is the garden, cultivated by the occupant of the cell. At K is the wood-house. F is a covered walk, with the necessary at the end.

The above arrangements are found with scarcely any variation in all the charter-houses of western Europe. The Yorkshire Charter-house of Mount Grace, founded by Thomas Holland, the young duke of Surrey, nephew of Richard II. and marshal of England, during the revival of the popularity of the order, about A.D. 1397, is the most perfect and best preserved English example.

Mendicant Friars.—An article on monastic arrangements would be incomplete without some account of the convents of the Mendicant or Preaching Friars, including the Black Friars or Dominicans, the Grey or Franciscans, the White or Carmelites, the Eremite or Austin Friars. These orders arose at the beginning of the 13th century, when the Benedictines, together with their various reformed branches, had terminated their active mission, and Christian Europe was ready for a new religious

no congregations, and cared for no possessions; therefore they built their church like a long room.

Carthusians.—The *Carthusian* order, on its establishment by St. Bruno, about A.D. 1084, developed a greatly modified form and arrangement of a monastic institution. The principle of this order, which combined the coenobitic with the solitary life, demanded the erection of buildings on a novel plan. This plan,

revival. Planting themselves, as a rule, in large towns, and by preference in the poorest and most densely populated districts, the Preaching Friars were obliged to adapt their buildings to the requirements of the site. Regularity of arrangement, therefore, was not possible, even if they had studied it. Their churches, built for the reception of large congregations of hearers rather than worshippers, form a class by themselves, totally unlike those of the elder orders in ground-plan and character. They were usually long parallelograms unbroken by transepts. The nave very usually consisted of two equal bodies, one containing the stalls of the brotherhood, the other left entirely free for the congregation. The constructional choir is often wanting, the whole church forming one uninterrupted structure, with a continuous range of windows. Taken as a whole, the remains of the establishments of the friars afford little warrant for the inventive of Matthew Paris, benedictine of St. Albans: "The friars who have been founded scarcely 40 years have built residences as the palaces of kings. These are they who, enlarging day by day their sumptuous edifices and encircling them with lofty walls, lay up in them their incalculable treasures, transgressing the bounds of poverty and violating the fundamental rules of their profession."

BIBLIOGRAPHY.—The classical authorities on the subjects of the foregoing article are Lenoir, *Architecture Monastique*, 1852-56, and Dugdale, *Monasticon Anglicanum* (reprinted 1846); F. A. Hibbert, *The Dissolution of the Monasteries* (1910); C. W. New, *History of the Alien Priors in England* (1916). See the articles on the different orders.

ABBON OF FLEURY or ABBO FLORIACENSIS (c. 945-1004), French scholar. He spent two years in England, and was abbot of Romsey. After his return to France he was made abbot of Fleury on the Loire (988). He was twice sent to Rome by King Robert the Pious (986-96), and on each occasion succeeded in warding off a threatened papal interdict. He was killed at La Réole in 1004, in endeavouring to quell a monkish revolt. He wrote an *Épître de vitis Romanorum pontificum*, besides controversial treatises, letters, etc. (see Migne, *Patrologia Latina*). His life, written by his disciple Aimoin of Fleury, in which much of Abbon's correspondence was reproduced, is of great importance as a source for the reign of Robert II., especially with reference to the papacy (cf. Migne, *op. cit.* vol. cxxxix.).

ABBOT, CHARLES GREELEY (1872-), American astrophysicist, was born in Wilton, N.H., on May 31, 1872. He graduated in 1894 from the Massachusetts Institute of Technology, and after a year of graduate study there joined the staff of the astrophysical observatory of the Smithsonian Institution. Here he served first as assistant, 1895-96, and then as acting director in charge from 1896 until 1907, when he was appointed director. He made original investigations in solar physics, studying especially the infra-red solar spectrum, the solar constant of radiation, the variability of solar and terrestrial temperatures and the utilization of solar heat. In connection with his researches he conducted expeditions to observe total eclipses of the sun in 1900, 1901, 1908 and 1919. In collaboration with S. P. Langley he completed the mapping of the infra-red spectrum, published in the *Annals* (vol. i.) of the astrophysical observatory. With F. E.

FIG. 8.—DETAIL PLAN OF A CARTHUSIAN CELL AT CLERMONT. THE GENERAL PLAN OF CLERMONT PROVIDES FOR SEPARATE CELLS FOR EACH MONK. THE ORDER WAS FOUNDED BY ST. BRUNO, 1084

Fowle and L. B. Aldrich he published also in the *Annals* (vol. iii., iv.) proofs of the variability of the sun, as shown by experiments conducted simultaneously in California and Algeria and from observations made in expeditions to Arizona and Chile. In recognition of his discoveries he was awarded the Draper medal (1910) and the Rumford medal (1916). To scientific journals he has contributed numerous articles on the apparatus, methods and results of solar research. He published *The Sun* (1907), *Everyday Mysteries* (1923) and *The Earth and the Stars* (1925). In 1918 he was made assistant secretary, and in 1928 secretary, of the Smithsonian Institution.

ABBOT, EZRA (1819-1884), American biblical scholar, was born at Jackson, Me., April 28, 1819. He graduated at Bowdoin college in 1840; and, after being principal of a public school in Cambridge, became assistant librarian of Harvard university, and from 1872 until his death Bussey Professor of New Testament Criticism and Interpretation in the Harvard divinity school. His studies were chiefly in oriental languages and the textual criticism of the New Testament, though he was a remarkable bibliographer. His publications were largely dispersed in the pages of reviews and other publications, but to the enlarged American edition of Smith's *Dictionary of the Bible* (1867-70), he contributed more than 400 articles besides greatly improving the bibliographical completeness of the work. His principal single production, representing his scholarly method and conservative conclusions, was *The Authorship of the Fourth Gospel* (1880; second edition, by J. H. Thayer, with other essays, 1889), up to that time probably the ablest defence, based on external evidence, of the Johannine authorship, and certainly the most complete treatment of the relation of Justin Martyr to this gospel. He died in Cambridge, Mass., March 21, 1884.

See S. J. Barrows, *Ezra Abbot* (1884).

ABBOT, GEORGE (1562-1633), Archbishop of Canterbury, was born on Oct. 19, 1562, at Guildford, Surrey, the son of a cloth-worker. Educated at Balliol College, Oxford, he became master of University College (1597) and dean of Winchester (1600).

He was one of those who prepared King James's Version of the Bible. James I. sent him to Scotland in 1608 to arrange for the establishment of episcopacy there. On his return he was preferred to the bishopric of Lichfield and Coventry (1609), London (1609) and Canterbury (1611). As vice-chancellor of the University of Oxford at different times between 1600 and 1605, he had come into conflict with Laud, and at court he supported Puritan measures. He promoted the marriage between the Elector Palatine and Princess Elizabeth, and resisted the proposal for the marriage of the Prince of Wales to the Spanish infanta.

Under Charles I. he was suspended from his functions of primate for refusing to license the Assize sermon preached by Robert Sibthorp at Northampton (Feb. 22, 1627), advocating non-resistance to the royal demands, however arbitrary. He died at Croydon, Aug. 5, 1633, and was buried at Guildford, where he had endowed a hospital. Abbot's later years were clouded by the fact that in 1622 he had accidentally shot a keeper while hunting. His enemies maintained that the homicide, though accidental, disqualified him from office, and the matter had to be referred to a commission, on which King James had to exercise his casting vote in the archbishop's favour.

ABBOT, WILLIAM (1798-1843), English actor, was born in Chelsea, and made his first appearance on the stage at Bath in 1806, and his first London appearance in 1808. He created the parts of Appius Claudius in Sheridan Knowles's *Virginius* (1820) and of Modus in his *Hunchback* (1832). In 1827 he organized the company, including Macready and Miss Smithson, which acted Shakespeare in Paris. Two of Abbot's melodramas, *The Youthful Days of Frederick the Great* (1817) and *Swedish Patriotism* (1819), were produced at Covent Garden. He died in poverty at Baltimore, Maryland.

ABBOT, the head and chief governor of a community of monks, called also in the East *hegumenos* or *archimandrite*. The title abbot is derived ultimately from the Hebrew *ab*, "father," through

the Syriac *abbas*, and had its origin in the monasteries of Syria, whence it spread through the East, and soon became accepted in all languages as the designation of the head of a monastery. But though general in the West, it was never universal. Among the Dominicans, Carmelites, Augustinians, etc., the superior was called *Prior*; among the Franciscans, *Custos* ("guardian").

In Egypt, the first home of monasticism, the abbot or archimandrite sometimes ruled over only one community, sometimes over several, each of which had its own abbot as well. By the rule of St. Benedict, which, until the reform of Cluny, governed monasticism in the West, the abbot has jurisdiction over only one community. The rule was subject to frequent violations; but it was not until the foundation of the Cluniac Order that the idea of a supreme abbot, exercising jurisdiction over all the houses of an order, was definitely recognized. New styles expressed this new relation; thus the abbot of Monte Cassino was called *abbas abbatum* ("abbot of abbots"), while the chiefs of other orders had the titles *abbas generalis* ("abbot general"), or *magister* ("master") or *minister generalis* ("minister general").

Monks, as a rule, were laymen, nor at the outset was the abbot any exception. All orders of clergy, therefore, took precedence of him. For religious offices the abbot and his monks were commanded to attend the nearest church.

Abbots were originally subject to episcopal jurisdiction, and continued generally so in the West till the 11th century. The first case recorded of the partial exemption of an abbot from episcopal control is that of Faustus, abbot of Lerins, at the council of Arles, A.D. 456; but the exorbitant claims and exactions of bishops rendered it increasingly frequent, and, in the 6th century, the practice of making religious houses responsible to the Pope alone received an impulse from Gregory the Great. These exceptions, introduced with a good object, had grown into a widespread evil by the 12th century, the bishop being deprived of all authority over the chief centres of influence in his diocese. Abbots more and more assumed almost episcopal state, and adopted the episcopal insignia of mitre, ring, gloves and sandals, a custom which arose out of the granting by the Pope of the right to wear the mitre to particular distinguished abbots.

The first undoubted instance is the bull by which Alexander II. in 1063 granted the use of the mitre to Egelsinus, abbot of St. Augustine at Canterbury (see MITRE).

The adoption of episcopal insignia by abbots was followed by an encroachment on episcopal functions, which was ineffectually guarded against by the Lateran Council, A.D. 1123. In A.D. 1489 they were permitted by Innocent IV. to confer both the subdiaconate and diaconate. They always and everywhere had the power of admitting their own monks and vesting them with the religious habit. Originally the bishop of the diocese chose the abbot out of the monks of the convent, but the right of election was transferred by jurisdiction to the monks themselves, reserving to the bishop the confirmation of the election and the benediction of the new abbot. In abbeys exempt from episcopal jurisdiction the confirmation and benediction had to be conferred by the Pope in person, the house being taxed with the expenses of the new abbot's journey to Rome. An abbot had to be at least 25 years of age, of legitimate birth, and a monk of the house, unless it furnished no suitable candidate. The election was for life, unless the abbot was canonically deprived by the chiefs of his order, or, when he was directly subject to them, by the Pope or the bishop. The power of the abbot was absolute, limited only by the canons of the church and, until the general establishment of exemptions, by episcopal control. As a rule, however, implicit obedience was enforced.

The abbot was treated with the utmost reverence by the brethren of his house. If he gave a command, the monk receiving it was to kneel. No monk might sit in his presence, or leave it without his permission. In the East he was commanded to eat with the other monks. In the West the rule of St. Benedict appointed him a separate table, at which he might entertain guests and strangers. This permission opening the door to luxurious living, the Council of Aix, A.D. 817, decreed that the abbot should dine in the refectory on the same fare as the monks, unless he

had to entertain a guest. These ordinances proved, however, generally ineffectual, and contemporaneous literature abounds with satirical remarks and complaints concerning the inordinate extravagance of the tables of the abbots.

The ordinary dress of the abbot was according to rule to be the same as that of the monks. But by the 10th century the rule was commonly set aside, and we find frequent complaints of abbots adopting sumptuous attire. They sometimes even laid aside the monastic habit altogether. With the increase of wealth and power, abbots, in fact, lost much of their religious character, and vied in magnificence with the first nobles of the realm. They rode on mules with gilded bridles, rich saddles and housings, carrying hawks on their wrists, followed by an immense train of attendants. They associated on equal terms with laymen of the highest distinction, and shared all their pleasures and pursuits. This rank and power was, however, often used most beneficially. For instance, Richard Whiting, the last abbot of Glastonbury, judicially murdered by Henry VIII. in 1539, educated in his household as many as 300 sons of noblemen and gentlemen, besides others of a meaner rank, whom he fitted for the universities. The abbots of Cluny and Vendôme were, by virtue of their office, cardinals of the Roman church.

In process of time the title abbot was improperly transferred to clerics who had no connection with the monastic system, as to the principal of a body of parochial clergy. It even came to be adopted by purely secular officials. Thus the chief magistrate of the republic at Genoa was called *Abbas Populi* ("the abbot of the people"). Lay abbots were the outcome of the growth of the feudal system from the 8th century onwards. The practice of *commendation*, by which (to meet a temporary emergency) the revenues of the community were handed over to a lay lord and in return for his protection, early suggested to the emperors and kings the expedient of rewarding their warriors with rich abbeys held *in commendam*. During the Carolingian epoch the custom grew up of granting these as regular heritable fiefs or benefices, and by the 10th century the system was firmly established. The example of the kings was followed by the feudal nobles, sometimes by making a temporary concession permanent, sometimes without any form of commendation whatever.

These lay abbacies were not merely a question of overlordship, but implied the concentration in lay hands of all the rights, immunities and jurisdiction of the foundations; i.e., the more or less complete secularization of spiritual institutions. The lay abbot took his recognized rank in the feudal hierarchy, and was free to dispose of his fief as in the case of any other.

In conventual cathedrals, where the bishop occupied the place of the abbot, the functions usually devolving on the superior of the monastery were performed by a prior.

The title *abbé* (Ital. *abbate*), as commonly used in the Roman Catholic church on the European continent, is the equivalent of the English "Father," being loosely applied to all who have received the tonsure. In the German Evangelical church the title of abbot (*Abt*) is sometimes bestowed, like *abbé*, as an honorary distinction, and sometimes survives to designate the heads of monasteries converted at the Reformation into collegiate foundations. Of these the most noteworthy is the abbey of Lokkum in Hanover, founded as a Cistercian house in 1163 by Count Wilbrand of Hallermund, and reformed in 1593.

BIBLIOGRAPHY.—See Joseph Bingham, *Origines ecclesiasticæ* (1840); Du Cange, *Glossarium med. et inf. Lat.* (ed. 1883); J. Craigie Robertson, *Hist. of the Christian Church* (1858-73); Edmond Martène, *De antiquis ecclesiæ ritibus* (Venice, 1783); C. F. R. de Montalembert, *Les moines d'occident depuis S. Benoît jusqu'à S. Bernard* (1860-77); Achille Luchaire, *Manuel des institutions françaises* (Paris, 1892).

ABBOTSFORD, former residence of Sir Walter Scott, on south bank of the Tweed, about 3m. W. of Melrose, Roxburghshire, Scotland, and nearly 1m. from Abbotsford Ferry Station, L.N.E.R. branch line. Cartleyhole, nicknamed Clarty (muddy) Hole, a farm of 100ac., was bought by Scott (1811) when his lease of Ashestiel, near by, lapsed; he added to it and finally bought Toftfield (afterwards Huntlyburn) in 1817, building his house in Scottish baronial style with relics from historical structures such as the doorway of the old Tolbooth in Edinburgh. A reverse of

fortune in 1825 involved Scott in debt, but the creditors made him a free gift of the library in 1830 and Robert Cadell the publisher cancelled all mortgages in 1847 in exchange for the family's share in the copyright of Sir Walter's works. The house has remained in the hands of descendants of Scott. Abbotsford gave its name to the Abbotsford club, a successor of the Bannatyne and Maitland clubs, founded by W. B. D. D. Turnbull in 1834 in Scott's honour, for printing and publishing historical works connected with his writings. Its publications extended from 1835 to 1864.

ABBOTT, EDWIN ABBOTT (1838-1926), English schoolmaster and grammarian, succeeded G. F. Mortimer as headmaster of the City of London School in 1865. He was the author of a *Shakespearean Grammar* (1870), which is a permanent contribution to English philology, and of many theological works, among them the article on the Gospels in the 9th ed. of the *Encyclopædia Britannica*.

His brother, Evelyn Abbott (1843-1901), was a tutor of Balliol, Oxford, and author of a scholarly *History of Greece*.

ABBOTT, EMMA (1849-1891), American singer, was born in Chicago, Ill., and studied in Milan and Paris. She had a fine soprano voice, and appeared first in opera in London at Covent Garden, also singing at important concerts. She organized an opera company known by her name, and toured extensively in the United States, where she had a great reputation. In 1873 she married E. J. Wetherell. She died at Salt Lake City (Utah), Jan. 5, 1891.

ABBOTT, GEORGE (1887-), American playwright and actor, was born in Forestville, N.Y., in 1887. He graduated at the University of Rochester (1911), where he wrote and acted for the dramatic club. The following year he studied dramatic writing with Prof. George Pierce Baker at Harvard, had a one-act play produced by the Harvard dramatic club, and won a prize play contest at the Keith Bijou theatre. In order to learn more about the stage and before having any plays accepted for professional productions he became an actor. He appeared in important rôles in *Zander the Great*, with Alice Brady; *Hell Bent for Heaven* and *Processional*, where his acting of the blinded Ishmaelite was particularly outstanding, and other Broadway productions. His first play to be produced, *Fall Guy* (published in the *Best Plays of 1924-25*), was written in collaboration with James Gleason; the next, *Love 'Em and Leave 'Em*, with John V. A. Weaver; *The Holy Terror*, with Winchell Smith; and *Four Walls*, with Dana Burnet. His *Broadway* (published in the *Best Plays of 1926-27*), written with Phillip Dunning, was one of the dramatic successes of 1926-27. His *Coquette*, a play memorable for its rendering of life in the southern United States, was likewise a notable production of the season 1927-28.

ABBOTT, GRACE (1878-), American social worker, was born Nov. 17, 1878, at Grand Island, Nebraska. She graduated from Grand Island college in 1898, and, after teaching for nine years, became in 1908 director of the Immigrants' Protective League and a resident of Hull House, Chicago. She received the degree of M.A. from the University of Chicago in 1909. From 1917 to 1920 she was director of the child labour division of the children's bureau at Washington, D.C., and subsequently executive secretary of the Illinois immigrants' commission, returning to Washington in 1921 as chief of the children's bureau. She served in 1923 as consultative member for the United States on the advisory committee of the League of Nations on traffic in women and children, now a sub-committee of the commission on the welfare of children and young persons. She was president of the National Conference of Social Workers in 1924. She is the author of *The Immigrant and the Community* (1917) and a number of reports and articles on immigration and child welfare.

ABBOTT, JACOB (1803-1879), American writer of books for the young, was born at Hallowell (Me.) on Nov. 14, 1803. He graduated at Bowdoin college in 1820; studied at Andover Theological Seminary. He was tutor in 1824-25, and from 1825 to 1829 was professor of mathematics and natural philosophy in Amherst college; was licensed to preach by the Hampshire Association in 1826; founded the Mt. Vernon School for young ladies

in Boston in 1829, and was principal until 1833; was pastor of Eliot Congregational church (which he founded) at Roxbury (Mass.), in 1834-35; and was, with his brothers, a founder, and in 1843-51 a principal, of Abbott's Institute, and in 1845-48 of the Mt. Vernon School for boys, in New York city. He was a prolific author, writing juvenile stories, brief histories and biographies, and religious books for the general reader, and a few works in popular science. He died on Oct. 31, 1879, at Farmington (Me.), where he had spent part of his time since 1839. The best known of his writings are those which feature the boyish paragon Rollo—*Rollo at Work*, *Rollo at Play*, *Rollo in Europe*, etc. (28 vol.). In these didactic tales Abbott did for one or two generations of young American readers a service not unlike that performed earlier by the author of *Sandford and Merton*. Of his other writings the best are the *Franconia Stories* (10 vol.), 22 vol. of biographical histories, and the *Young Christian*—all of which had enormous circulations.

See his *Young Christian, Memorial Edition, with a Sketch of the Author by one of his sons*, i.e., Edward Abbott (1882), with a bibliography of his works; also Lyman Abbott, *Silhouettes of My Contemporaries* (1921).

ABBOTT, SIR JAMES (1807-1896), British soldier, educated at the Military College, Addiscombe. He served in the Bengal Artillery at the siege of Bhurtpore, 1825-26. He was the first Englishman to visit Khiva, where he was sent on a mission in 1839. During the Sikh war in 1849-50, he held Hazara, of which he was commissioner from 1847-54. He died Oct. 6, 1896.

ABBOTT, JOHN STEVENS CABOT (1805-1877), American writer, was born in Brunswick, Me., on Sept. 18, 1805. He was a brother of Jacob Abbott, with whom he was associated in the management of Abbott's Institute, New York city, and in the preparation of his series of brief historical biographies. He is best known, however, as the author of a partisan and unscholarly but very readable *History of Napoleon Bonaparte* (1855). Dr. Abbott graduated at Bowdoin college in 1825, studied at Andover theological seminary, and between 1830 and 1844, when he retired from the ministry, preached successively at Worcester, Roxbury and Nantucket, Massachusetts. He died at Fair Haven, Conn., on June 17, 1877. He was a voluminous writer of books on Christian ethics, and of popular histories.

ABBOTT, LYMAN (1835-1922), American divine and author, was born at Roxbury (Mass.), on Dec. 18, 1835, the son of Jacob Abbott. He graduated at New York university in 1853, studied law, and was admitted to the bar in 1856; but abandoning the legal profession, after studying theology with his uncle, J. S. C. Abbott, he was ordained a minister of the Congregational church in 1860. After pastorates in Terre Haute (Ind.), and New York City, he became an associate editor of *Harper's Magazine*, editor of the *Illustrated Christian Weekly*, and co-editor (1876-81) of *The Christian Union* with Henry Ward Beecher, whom he succeeded in 1888 as pastor of Plymouth church, Brooklyn. From this pastorate he resigned 11 years later. From 1881 he was editor-in-chief of *The Christian Union*, renamed *The Outlook* in 1893; this periodical reflected his efforts toward social reform and his humane and liberal theology. To the end of his long life he continued to take an active and authoritative part in the discussion of public questions. He died in New York City on Oct. 22, 1922.

The serenity and dignity of his life are reflected in his works which include, besides his many magazine articles, *Jesus of Nazareth* (1869); *Evolution of Christianity* (Lowell Lectures, 1896); *The Theology of an Evolutionist* (1897); *Christianity and Social Problems* (1897); *Life and Letters of Paul* (1898); *Problems of Life* (1900); *The Rights of Man* (1901); *Henry Ward Beecher* (1903); *The Christian Ministry* (1905); *The Personality of God* (1905); *Industrial Problems* (1905); *America in the Making* (1911); and *Reminiscences* (1915).

ABBOTT, WILBUR CORTEZ (1869-), American educator and historian, was born in Kokomo, Ind., Dec. 28, 1869. Following his graduation from Wabash college, Crawfordsville, Ind., in 1892, he pursued graduate studies at Cornell university in 1892-95 and in Europe during 1895-96. Upon returning from Europe he taught history in the University of Michigan in 1897-99, was assistant professor of history in Dartmouth college in

1899-1902 and professor of European history in the University of Kansas from 1902 to 1908. He entered the faculty of Yale university in 1908 as professor of history and served in this chair until 1920 when he became professor of history in Harvard university. Among his published writings are *Colonel Blood, Crown Stealer* (1911), *The Expansion of Europe* (1917), *Colonel John Scott of Long Island* (1918), *The New Barbarians* (1925).

ABBOTTABAD, a town of British India, 4,120ft. above sea-level, 63m. from Rawalpindi, the headquarters of the Hazara district in the North West Frontier Province, called after its founder, Sir James Abbott, who settled this wild district after the annexation of the Punjab. It is an important military cantonment and sanatorium, being the headquarters of a brigade in the Rawalpindi division of the northern army. It is remarkable for the rock inscription of Asoka close by.

ABBREVIATION, strictly a shortening; more particularly, an "abbreviation" is a letter or group of letters, taken from a word or words, and employed to represent it or them for the sake of brevity. Abbreviations, both of single words and of phrases, having a meaning more or less fixed and recognized, were common in ancient writings and inscriptions (see *PALAEOGRAPHY*) and very many are in use at the present time. The commonest form of abbreviation is the substitution for a word of its initial letter; but one or more of the other letters are frequently added. Letters are often doubled to indicate a plural or a superlative.

There is no occasion to explain here the common abbreviations used for Christian names, books of Scripture, points of the compass, grammatical and mathematical terms, etc. For a list of abbreviations of the chemical elements see *ATOMIC WEIGHTS*.

The list of abbreviations that follows are those now in use.

ABBREVIATIONS NOW IN USE

ABBREVIATORS, officials in the papal chancery, whose business was to draft the pope's bulls, briefs and consistorial decrees before these were written out *in extenso* by the *scriptores*. They are first mentioned in *Extravagantes* of John XXII. Pius II. fixed their number at 70, and formed them into a college of prelates, classing them as *de Parco majori* and *de Parco minori*. The present college consists of 17 prelates, six substitutes, and one sub-substitute. (See *CURIA ROMANA*.)

A.B.C. POWERS, a designation which came into use shortly before the World War for the three leading South American powers—Argentina, Brazil and Chile. For many years previously a current of opinion had prevailed in several republics of South America favouring an alliance to counteract certain political tendencies of the United States and particularly the Monroe Doctrine. Recalling unsettled boundaries and other political problems, statesmen of certain Latin American republics had, from

time to time, provided for arbitration agreements or other means of mutual assistance in case of emergencies. Among such was the treaty between Brazil and Chile in 1899; between Argentina and Chile in 1902; and between Argentina and Brazil in 1905. These pacts have been regarded as the forerunners of the three-power *entente cordiale* that gradually developed and was discussed at the first Pan-American Scientific Congress, held at Santiago, Chile, in 1908-09. In 1915 Argentina, Brazil and Chile concluded among themselves a group of treaties of peace and arbitration.

On April 25, 1914, when war between the United States and Mexico appeared imminent, the Governments of Argentina, Brazil and Chile, through their diplomatic representatives at Washington, Dr. Rómulo S. Naón, Sr. Domicio da Gama, and Don Eduardo Suárez, respectively, addressed the secretary of State of the United States tendering their services as mediators. This mediation was accepted by President Woodrow Wilson, who appointed as United States delegates Justice Joseph R. Lamar and Frederick W. Lehmann, while Mexico chose as her representatives Sres. Emilio Rabasa, Augustin Rodriguez and Luis Elguero. These A.B.C. mediators, together with the Americans and the Mexicans, met in a series of sessions at Niagara Falls, Canada. The deliberations began on May 18, 1914, and were continued until August of the same year. The result of the conference was thus summarized by the Brazilian delegate, Senhór da Gama, as follows: "We have established, through agreement between the parties most directly interested, and in complete harmony with the sentiments of the Government of the United States, that it is a principle of American policy to have our national problems always given a fair examination and settled without foreign interference."

(W. A. R.)

ABDALLATIF or **ABD-UL-LATIF** (1162-1231), physician and traveller, was born and died in Baghdad. A memoir of Abdallatif, written by himself, has been preserved with additions by Ibn-Abu-Osaiba (Ibn abi Usaibia), a contemporary. He visited Mosul, Damascus and Egypt and then joined the circle of learned men whom Saladin gathered around him at Jerusalem. He taught medicine and philosophy at Cairo and at Damascus for a number of years, and afterwards, for a shorter period, at Aleppo.

Of the numerous works—mostly on medicine—which Osaiba ascribes to him, one only, his graphic and detailed *Account of Egypt*, appears to be known in Europe. The manuscript, discovered by Edward Pococke, the Orientalist, and preserved in the Bodleian Library, contains a vivid description of a famine caused by the Nile failing to overflow its banks. It was translated into Latin by Professor White of Oxford in 1800 and into French, with valuable notes, by De Sacy in 1810.

'ABD-AR-RAHMAN, the name borne by five princes of the Omayyad dynasty, amirs and caliphs of Cordova.

'ABD-AR-RAHMAN I. (756-788) founded the branch of the family which ruled for nearly three centuries in Mohammedan Spain. When the Omayyads were overthrown in the East by the Abbasids, 'Abd-ar-Rahman ibn Moawya, grandson of the caliph Histrām, was a young man of about 20 years of age. Together with his brother Yahya, he took refuge with Bedouin tribes in the desert. The Abbasids hunted their enemies down without mercy. Yahya was slain, and 'Abd-ar-Rahman saved himself by fleeing first to Syria and thence to northern Africa which had fallen into the hands of local rulers, formerly amirs or lieutenants of the Omayyad caliphs, but now aiming at independence. In the midst of all his perils, which read like stories from the *Arabian Nights*, 'Abd-ar-Rahman had been encouraged by a prophecy of his great-uncle Maslama that he would restore the fortunes of the family. He was followed in all his wanderings by a few faithful clients of the Omayyads. In 755 he was in hiding near Ceuta, and he sent an agent over to Spain to ask for the support of other clients of the family, descendants of the conquerors of Spain, who were numerous, in the province of Elvira, the modern Granada. On the invitation of his partisans he landed at Almuñecar, to the east of Malaga, on Aug. 14, 755. In the course of 756 a campaign was fought in the valley of the Guadalquivir, which ended, on May 16, in the defeat of the emir Yūsuf outside Cordova. 'Abd-ar-Rahman's army was so ill provided that he mounted almost the

only good war-horse in it; he had no banner, and one was improvised by unwinding a green turban and binding it round the head of a spear. The turban and the spear became the banner of the Spanish Omayyads. Yūsuf recognized 'Abd-ar-Rahman as emir of Spain in July 756. (See SPAIN.)

'ABD-AR-RAHMAN II. (822-852), son of the emir Hakam, was one of the weaker of the Spanish Omayyads. He was a prince with a taste for music and literature.

'ABD-AR-RAHMAN III. (912-961) was the greatest and the most successful of the princes of his dynasty in Spain (for the general history of his reign see SPAIN: *History*). He succeeded his grandfather 'Abdallāh when he was barely 22 and reigned for half a century. 'Abd-ar-Rahman III. came to the throne when the country was exhausted by more than a generation of tribal conflict among the Arabs, and of strife between them and the Mohammedans of native Spanish descent. Spaniards who were openly or secretly Christians had acted with the renegades. These elements were not averse from supporting a strong ruler who would protect them against the Arab aristocracy. These restless nobles were the most serious of 'Abd-ar-Rahman's enemies. Next to them came the Fatimites of Egypt and northern Africa, who claimed the caliphate, and who aimed at extending their rule over the Mohammedan world, at least in the west. 'Abd-ar-Rahman subdued the nobles by means of a mercenary army, which included Christians. He repelled the Fatimites, partly by supporting their enemies in Africa and partly by claiming the caliphate for himself. His ancestors in Spain had been content with the title of sultan. The caliphate was thought only to belong to the prince who ruled over the sacred cities of Mecca and Medina. But the force of this tradition had been so far weakened that 'Abd-ar-Rahman could proclaim himself caliph on Jan. 16, 929. His worst enemies were always his fellow Mohammedans. After he was defeated by the Christians at Alhandega in 939 through the treason of the Arab nobles in his army (see SPAIN: *History*) he never again took the field.

In the agony of the Omayyad dynasty in Spain, two princes of the house were proclaimed caliphs for a very short time, 'Abd-ar-Rahman IV. Mortada (1017), and 'Abd-ar-Rahman V. Mostadir (1023-24). Both were the mere puppets of factions, who deserted them at once. 'Abd-ar-Rahman IV. was murdered in the year in which he was proclaimed, at Guadiz, when fleeing from a battle in which he had been deserted by his supporters. 'Abd-ar-Rahman V. was proclaimed caliph in Dec. 1023 at Cordova, and murdered in Jan. 1024 by a mob of unemployed workmen, headed by one of his own cousins.

The history of the Omayyads in Spain is the subject of the *Histoire des Musulmans d'Espagne* by R. Dozy (Leyden, 1861).

ABD-EL-AZIZ IV. (1880-), sultan of Morocco, son of Sultan Mulai el Hasan III. by a Circassian wife. He was 14 years of age on his father's death in 1894. By the wise action of Si Ahmad bin Musa, the chamberlain of el Hasan, Abdel-Aziz's accession to the sultanate was ensured with but little fighting. Si Ahmad became regent and for six years showed himself a capable ruler. On his death in 1900 the regency ended, and Abd-el-Aziz took the reins of government into his own hands, with an Arab from the south, el Menebhi, for his chief adviser. Urged by his Circassian mother, the sultan sought advice and counsel from Europe and endeavoured to act up to it. But disinterested advice was difficult to obtain, and in spite of the unquestionable desire of the young ruler to do the best for the country, wild extravagance both in action and expenditure resulted, leaving the sultan with depleted exchequer and the confidence of his people impaired. His intimacy with foreigners and his imitation of their ways were sufficient to rouse fanaticism and create dissatisfaction. Europeans were accused of having spoiled the sultan and of being desirous of spoiling the country. When British engineers were employed to survey the route for a railway between Mequinez and Fez this was reported as indicating an absolute sale of the country. The fanaticism of the people was aroused and a revolt broke out near the Algerian frontier. Such was the condition of things when the news of the Anglo-French Agreement of 1904 came as a blow to Abd-el-Aziz, who had relied

on England for support and protection against the inroads of France. On the advice of Germany he proposed the assembly of an international conference at Algier in 1906 to consult upon methods of reform, the sultan's desire being to ensure a condition of affairs which would leave foreigners with no excuse for interference in the control of the country. The sultan gave his adherence to the Act of the Algier Conference, but the state of anarchy into which Morocco fell during the latter half of 1906 and the beginning of 1907 exposed the weakness of his government. In May 1907 the southern tribes invited Mulai Hafid, an elder brother of Abd-el-Aziz, and viceroy at Marrakesh, to become sultan, and in the following August Hafid was proclaimed sovereign. In the meantime the murder of Europeans at Casablanca had led to the occupation of that port by France. In September Abd-el-Aziz arrived at Rabat from Fez to seek the support of the European powers against his brother. From France he was later enabled to negotiate a loan. His leaning to Christians aroused further opposition and in January 1908 he was declared deposed by the ulema of Fez, who offered the throne to Hafid. After months of inactivity Abd-el-Aziz made an effort to restore his authority, and quitting Rabat in July he marched on Marrakesh. His force was completely overthrown (Aug. 19) when near that city, and Abd-el-Aziz fled to Settat within the French lines round Casablanca. In November he came to terms with his brother, and thereafter took up his residence in Tangier as a pensioner of the new sultan. (*See MOROCCO: History.*)

ABD-EL-KADER (1807?-1883), amir of Mascara, the great opponent of the conquest of Algeria by France, was born near Mascara in 1807 or 1808. His family were *sherifs* or descendants of Mohammed, and his father, Mahi-ed-Din, was celebrated throughout north Africa for his piety and charity. Abd-el-Kader received an excellent education in theology and philosophy, in horsemanship and in other manly exercises. A pilgrimage to Mecca and Medina and to the tomb of Sidi Abd-el-Kader El Jalili at Baghdad stimulated his religious enthusiasm. While in Egypt in 1827, Abd-el-Kader was impressed by the reforms then being carried out by Mohammed Ali, and the knowledge he then gained affected his career. Mahi-ed-Din and his son returned to Mascara shortly before the French occupation of Algiers destroyed the government of the Dey (July 1830). Coming forward as the champion of Islam against the infidels, Abd-el-Kader was proclaimed amir at Mascara in 1832. In a short time he had rallied to his standard all the tribes of western Algeria. The story of his 15 years' struggle against the French is given under ALGERIA. Up to the beginning of 1842 the contest went in favour of the amir; thereafter he found in Marshal Bugeaud an opponent who proved, in the end, his master. Throughout this period Abd-el-Kader showed himself a born leader of men, a great soldier, a capable administrator, a persuasive orator, a chivalrous opponent. His ultimate failure was due in considerable measure to the refusal of the Kabyles, Berber mountain tribes whose Mohammedanism was somewhat loosely held, to make common cause with the Arabs against the French. On Dec. 21, 1847 Abd-el-Kader surrendered to General Lamoricière at Sidi Brahimi. On the 23rd, his submission was formally made to the duc d'Aumale, then governor of Algeria. In violation of the promise that he would be allowed to go to Alexandria or St. Jean d'Acre, Abd-el-Kader and his family were detained in France, where he remained until Oct. 1852, when he was released by Napoleon III. on taking an oath never again to disturb Algeria. The amir then lived in Brusa, removing in 1855 to Damascus. In July 1860, when the Muslims attacked the Christian quarters of Damascus, Abd-el-Kader saved large numbers of Christians.

When the Algerians revolted, Abd-el-Kader, in 1871, counselled submission to France. After 1847 he composed a philosophical treatise, of which a French translation was published in 1858 under the title of *Rappel à l'intelligent, Avis à l'indifférent*. He also wrote a book about the Arab horse. He died at Damascus on May 26, 1883.

See Commdt. J. Pichon, *Abd el Kader, 1807-83* (1899); Alex. Bellemare, *Abd-el-Kader: sa vie politique et militaire* (1863); Col. C. H. Churchill, *The Life of Abdel Kader* (1867).

ABDEL KRIM, Mohammed ben Abdel Krim el-Khatabe, a Moroccan chieftain, was the son of a caid of the Beni Uriaghel tribe inhabiting the mountainous country that extends inland from Alhucemas bay on the Rif coast of Morocco. His father was a person of no particular importance or family, but, being a man of progressive ideas and in contact with the Spaniards at Melilla, he gave his two sons an education to which few of the Riffian tribesmen aspire. While Mohammed, the future Riffian leader, was taught Spanish and a smattering of European knowledge, his brother, Mohammed, was sent to Spain and educated as a mining engineer. (It is customary among the peoples of northern Africa and Egypt to give brothers the same name if it is an illustrious one.) Abdel Krim was employed in the office of native affairs at Melilla, while his brother worked in the interests of certain mining groups.

In 1919 a quarrel between Abdel Krim and General Silvestre, of the Spanish army, led to the former's flight from Melilla. He took to the mountains of his tribe, where his brother joined him. Both swore revenge, and instituted a fierce resistance to the occupation of the Rif by the Spaniards. In 1921 Abdel Krim avenged himself of the slight he had received from Silvestre. With only a few hundred tribesmen, he attacked the Spanish advanced post of Anual and captured it. Silvestre was killed, or committed suicide. The fall of Anual spread panic through the Spanish army of 19,000 men. The Spanish posts were deserted, and the troops fled in disorderly retreat. Before the fighting was ended 16,000 of the 19,000 men had been massacred. The remainder mostly crossed into the French zone. The Riffian tribesmen were guilty of every kind of treachery and atrocity, their revenge for acts of which they accused the Spaniards, more especially that of forcible interference with their women, an unpardonable offence in their eyes. The Rifi reached the walls of Melilla, and, had they chosen, they could have captured the town and massacred its population of 50,000 civilians. But glutted with bloodshed and loaded with loot, they desisted.

This signal defeat of the Spaniards vastly increased Abdel Krim's reputation amongst the tribes. The Jabala, inhabiting the western portion of the Spanish zone, joined his cause and in 1924 the Spaniards were obliged to abandon all their inland positions and retreat on Tetuan and the sea, suffering heavy losses in the retirement. By the end of that year Abdel Krim, having rid himself by capture of his only rival, Raisuli, was master of the situation, and set to work to prepare a fresh campaign against the Spaniards. But a new danger threatened him from the south. The French, gradually occupying the zone to which they laid claim under existing treaties, were advancing northward, and Abdel Krim was forced to go to the aid of the threatened tribes. His army and the revolted tribesmen invaded the French protectorate, and by June 1925 threatened Fez.

French reinforcements were hurriedly dispatched from France and Algeria, and by October the French protectorate territory was clear of the enemy, and a French army of 160,000 men, under Marshal Pétain, was on the borders of the Rif. In September the Spaniards had successfully disembarked a force in Alhucemas bay and Ajdir had been taken. By Nov. 1, 1925 the French and Spanish armies had been obliged by the weather to abandon an active campaign, and were digging themselves into winter quarters, but Abdel Krim, though weakened and threatened, was by no means beaten. This man of great ability and astounding energy fortified his mountain fastnesses and collected new forces to continue his campaign against two European armies, but in vain. He surrendered to France in May 1926, and was exiled to the island of Réunion. *See* MOROCCO, HISTORY.

See Walter Harris, *France, Spain and the Rif* (1927).

(W. B. H.)

ABDERA, ancient town, coast of Thrace, near the mouth of the Nestos, almost opposite Thasos. Its mythical foundation was attributed to Heracles; historically it was a colony from Clazomenae in the 7th century B.C. But its prosperity dates from 544 B.C., when the majority of the people of Teos migrated to Abdera to escape Persian oppression (Herod. i. 168). The town seems to have declined in importance after the middle of the 4th

century. The air of Abdera was proverbial as causing stupidity; but among its citizens was the philosopher Democritus. The ruins on Cape Balastra cover seven small hills, and extend from an east to a west harbour; on the south-west hills are remains of the mediaeval settlement of Polystylon.

See *Mittheil. d. deutsch. Inst. Athens*, xii. (1887), p. 161 (Regel); *Mém. de l'Acad. des Inscriptions*, xxxix. 211; K. F. Hermann, *Ges. Abh.* 90-111, 370 ff.; S. Casson, *Macedon, Thrace and Illyria* (1926); Pauly-Wissowa, s.v.

ABDERA, an ancient seaport on the south coast of Spain, between Malaga and New Carthage, in the district inhabited by the Bastuli. Founded by the Carthaginians, it became an important town in the Roman province of Hispania Baetica. It was on a hill above the modern Adra (q.v.). Its most ancient coins bear the Phoenician inscription, *abdrī*, with the head of Heracles (Melkarth) and a tunny-fish; those of Tiberius (who seems to have made the place a colony) show the chief temple of the town with two tunny-fish erect in the form of columns. For inscriptions relating to the Roman municipality see *Corpus Inscriptionum Latinarum*, ii. 267.

ABDICATION, the act whereby a person in office renounces the same before the expiry of the time for which it is held. (Lat. *abdication*, from *ab*, from, and *dicare*, to proclaim as not belonging to one.) In Roman law, the term is especially applied to the disowning of a member of a family, as the disinheriting of a son, but the word is seldom used except in the sense of surrendering the supreme power in a State. Despotism is at liberty to divest themselves of their powers at any time, but it is otherwise with a limited monarchy. The throne of Great Britain cannot be lawfully abdicated unless with the consent of the two Houses of Parliament. When James II., after throwing the great seal into the Thames, fled to France in 1688, he did not formally resign the Crown, and the question was discussed in parliament whether he had forfeited the throne or had abdicated.

Recent abdications include: Pu-yi (China) Feb. 12, 1912; Nicholas II. (Russia) Mar. 15, 1917; Ferdinand I. (Bulgaria) Oct. 3, 1918; William II. (Germany) Nov. 9, 1918; Frederick Augustus III. (Saxony) Nov. 9, 1918; Charles I. (Austria-Hungary) Nov. 12, 1918; Louis III. (Bavaria) Nov. 13, 1918; Frederick II. (Baden) Nov. 22, 1918; William II. (Württemberg) Dec. 2, 1918; George II. (Greece) Dec. 18, 1923.

ABDOMEN, the belly, the region of the body containing most of the digestive organs. (See ANATOMY AND ALIMENTARY CANAL.)

ABDOMEN, SURGERY OF. The diseases of this region are dealt with generally in the article DIGESTIVE ORGANS, and under their own names (e.g., APPENDICITIS). Under the appropriate headings the surgery of each abdominal organ is dealt with (see STOMACH, KIDNEY, LIVER, etc.); here the general principles of abdominal surgery are discussed.

Exploratory Laparotomy.—In many cases of intra-abdominal disease the surgeon cannot say what is wrong without making an incision and examining by sight or touch. Under conditions of strict asepsis this is not a perilous or serious procedure. When an opening is made in such circumstances—provided only it is done soon enough—the successful treatment of the case often becomes a simple matter.

A great impetus was given to the surgery of wounded, mortified, or diseased pieces of intestine by the introduction from Chicago of a contrivance named, after the inventor, *Murphy's button*. This consists of a short nickel-plated tube in two pieces, which are secured in the divided ends of the bowel so that when the pieces are subsequently "married" the adjusted ends of the bowel are securely fixed together and the canal rendered practicable. In the course of time the button loosens itself into the interior of the bowel and comes away with the motions. In many other types of case the button has proved convenient and successful, but sometimes ulceration occurs around the rim of the metal button, or the loosened metal causes trouble in its passage along the alimentary canal. Some surgeons therefore prefer a bobbin of decalcified bone or similar soft material, while others rely upon direct suturing of the parts. The last-named method has in-

creased in favour. The cause of death in intestinal obstruction is usually absorption of poisonous substances formed in the bowel above the obstruction. Usually, therefore, the surgeon completes his operation for the relief of obstruction by drawing out a loop of the distended bowel, incising and evacuating it, and then carefully suturing and returning it.

Rectal or subcutaneous injections of saline or other fluid and early adoption of a sitting position for the patient are other measures often adopted.

Wounds of the Abdomen.—The treatment of gunshot wounds of the abdomen differs according to circumstances. If the wound be caused by a rifle bullet travelling at high speed, the intra-abdominal pressure is usually sufficient to prevent escape of intestinal contents; complete rest and avoidance of surgery is the procedure of choice, and the chance of recovery is great though several coils of intestine may have been pierced. But if the wound be caused by a fragment of high explosive shell, or a revolver shot or a stab this is not the case. To avoid the onset of peritonitis, early operation, suture of the wounded gut and washing out of the peritoneal cavity afford the only chance for the patient. The "expectant" treatment which proved best in the South African War (1899-1902) was at first followed in the World War, but soon was abandoned in favour of laparotomy.

Intussusception.—This is a terribly fatal disease of infants and children, in which a piece of bowel slips into, and is gripped by, the piece next below it. Formerly attempts were made to reduce the invagination by passing air or water up the rectum under pressure, but now early recourse is had to abdominal surgery with far better results.

Cancer of the Intestine.—With the introduction of aseptic surgery the bowel can be reached through the peritoneum easily and safely. If the cancerous mass is fairly movable the affected piece of bowel is excised, the cut ends are united and the continuity of the alimentary canal is re-established. When the lowest part of the bowel was found to be cancerous, the surgeon used formerly to secure an escape for the contents of the bowel by making an opening into the colon in the left loin. But in recent years this operation of *lumbar colotomy* has been almost entirely replaced by opening the colon in the left groin.

ABDUCTION, a law term denoting the forcible or unlawful removal of a person. The Offences against the Person Act 1861, by s. 53, makes it felony for any one from motives of lucre to take away or detain against her will, with intent to marry or carnally know her, etc., any woman of any age who has any interest in any real or personal estate, or is an heiress presumptive, or co-heiress, or presumptive next of kin to any one having such an interest; or for any one to cause such a woman to be married or carnally known by any other person; or for any one with such intent to allure, take away, or detain any such woman under the age of 21, out of the possession and against the will of her parents or guardians. By s. 54, forcible taking away or detention against her will of any woman of any age with like intent is felony. The same act, by s. 55, makes abduction without even any such intent a misdemeanour, where an unmarried girl under the age of 16 is unlawfully taken out of the possession and against the will of her parents or guardians. The girl's consent is immaterial, nor is it a defence that the person charged reasonably believed that the girl was 16 or over. By s. 56, stealing a child under the age of 14 with intent to deprive parents or guardian of such child is also a felony. The Criminal Law Amendment Act 1885 made still more stringent provisions with reference to abduction by making the procuration or attempted procuration of any virtuous female under the age of *twenty-one years* a misdemeanour, as well as the abduction of any girl under *eighteen years* of age with the intent that she shall be carnally known, or the detaining of *any female* against her will on any premises, with intent to have, or that another person may have, carnal knowledge of her.

In the United States, in some of the States, mere unchastity is no defence. The burden of proof is on the defendant that the woman abducted was unchaste, the presumption of her chastity standing unless otherwise proved.

ABDUL AZIZ (ahbd-ōl ah-zēz) (1830-1876), Sultan of Turkey, second son of Sultan Mahmud II., was born Feb. 9, 1830, and succeeded his brother Abdul Mejid as sultan 1861. He took advantage of the constant issue of State loans to acquire wealth which was squandered extravagantly, and received large sums from Ismail Pasha, the khedive of Egypt, for signing the firman of 1866, which made succession to the khedivate hereditary from father to son in direct line, as well as subsequent firmans of 1867, 1869 and 1872, extending the khedive's prerogatives. In 1870 Abdul Aziz signed the firman creating the Bulgarian exarchate, thus separating the Bulgarian church from the Greek church at Constantinople. The insurrection of 1875 in Bosnia and Hercegovina and the abortive revolts in Bulgaria (Sept. 1875 and May 1876) together with the Sultan's incapacity and extravagance in Turkey itself caused an outbreak of Muslim discontent and fanaticism culminating in the Bulgarian atrocities, and in the murder of two consuls at Salonika. Abdul Aziz was deposed May 29, 1876 by a group of prominent politicians, and his death, four days later, is attributed to suicide. Abdul Aziz was the first Ottoman sultan to visit western Europe (1867).

'ABDUL-AZIZ IBN SA'UD: *see* IBN SA'UD.

ABDUL-HAMID I. (1725-1789), sultan of Turkey, son of Ahmed III., succeeded his brother Mustafa III. in 1773, and died on April 7, 1789. For the disastrous wars with Russia which marked his reign *see* TURKEY.

ABDUL-HAMID II. (1842-1918), sultan of Turkey, son of Sultan Abdul-Mejid, was born on Sept. 21, 1842, and succeeded to the throne on the deposition of his brother Murad V., on Aug. 31, 1876. He accompanied his uncle Sultan Abdul-Aziz on his visit to England and France in 1867. At the time of his accession he was supposed to be of liberal principles, and conservative Turks were for some years inclined to regard him with suspicion as a too ardent reformer. But the circumstances of the country at his accession were ill-adapted for liberal developments. An empty treasury, the revolts in Serbia and Montenegro, the feeling aroused throughout Europe by the savage methods adopted in stamping out the Bulgarian rebellion, all combined to prove to the new sultan that he could expect little aid from the Powers. But he obstinately opposed the pressing requests of the Powers that the necessary reforms should be instituted. During the international conference which met at Constantinople towards the end of 1876, a constitution was indeed promulgated, but the demands of the conference were rejected in spite of solemn warnings. Midhat Pasha, the author of the constitution, was exiled, and his work was suspended.

Early in 1877 the disastrous war with Russia followed. The hard terms, embodied in the treaty of San Stefano, to which Abdul-Hamid was forced to consent, were to some extent amended at Berlin, thanks in the main to British diplomacy (*see* EUROPE: History); but by this time the sultan had lost all confidence in England, and thought that he discerned in Germany the future friend of Turkey. He employed Germans to reorganize his finances and army, and determined to resist foreign encroachments and gradually to take the reins of absolute power into his own hands. Financial embarrassments forced him to consent to a foreign control over the debt, and to issue the decree of Dec. 1881, under which many of the revenues of the empire were handed over to the Public Debt Administration for the benefit of the bondholders. Trouble in Egypt, where a discredited khedive had to be deposed, trouble on the Greek frontier and in Montenegro, where the Powers were determined that the decisions of the Berlin Congress should be carried into effect, were more or less satisfactorily got over. In his attitude towards Arabi, the would-be saviour of Egypt, Abdul-Hamid, showed less than his usual astuteness, and the resulting consolidation of England's hold over the country contributed still further to his estrangement from Turkey's old ally. The union in 1885 of Bulgaria with Eastern Rumania was another blow. Few people south of the Balkans dreamed that Bulgaria could be anything but a Russian province, and apprehension was entertained of the results of the union until it was seen that Russia really and entirely disapproved of it. For

some years the sultan preserved towards Bulgaria an attitude skilfully calculated to avoid running counter either to Russian or to German wishes. Germany's friendship was not entirely disinterested, and had to be fostered with a railway or loan concession from time to time, until in 1899 the Baghdad railway was conceded.

Meanwhile the sultan had succeeded in reducing his ministers to the position of secretaries, and in concentrating the whole administration of the country into his own hands at Yildiz. But internal dissension was not thereby lessened. Crete was constantly in turmoil, the Greeks were dissatisfied, and from about 1890 the Armenians began a violent agitation with a view to obtaining the reforms promised them at Berlin. Minor troubles had occurred in 1892 and 1893 at Marsovan and Tokat. In 1894 a more serious rebellion in the mountainous region of Sassun was ruthlessly stamped out; the Powers insistently demanded reforms, the eventual grant of which in the autumn of 1895 was the signal for a series of massacres in the Armenian provinces and in Constantinople itself. The reforms became more or less a dead letter. Crete indeed profited by the grant of extended privileges, but these did not satisfy its turbulent population, and early in 1897 a Greek expedition sailed to unite the island to Greece. War followed, in which Turkey was easily successful and gained a small rectification of frontier; then a few months later Crete was taken over *en dépôt* by the Four Powers (Germany and Austria not participating) and Prince George of Greece was appointed their mandatory. In the next year the sultan received the visit of the German emperor and empress.

Abdul-Hamid had always resisted the pressure of the European Powers to the last moment, in order to seem to yield only to overwhelming force, while posing as the champion of Islam against aggressive Christendom. Pan-Islamic propaganda was encouraged; the privileges of foreigners in the Ottoman Empire (often an obstacle to government) were curtailed; the new railway to the Holy Places was pressed on, and emissaries were sent to distant countries preaching Islam and the caliph's supremacy. This appeal to Muslim sentiment was, however, powerless against the disaffection due to perennial misgovernment. In Mesopotamia and Yemen disturbance was endemic; nearer home, a semblance of loyalty was maintained in the army and among the Muslim population by a system of delation and espionage, and by wholesale arrests; while, obsessed by terror of assassination, the sultan withdrew himself into fortified seclusion in the palace of Yildiz.

Macedonian Crisis.—The humiliation of the situation in Macedonia (*q.v.*), together with the resentment in the army against the palace spies brought matters to a crisis. The remarkable revolution associated with the names of Niazi Bey and Enver Bey, the young Turk leaders, and the Committee of Union and Progress is described elsewhere (*see* TURKEY: History); here it must suffice to say that Abdul-Hamid, on learning of the threat of the Salonika troops to march on Constantinople (July 23), at once capitulated. On the 24th an *iradé* announced the restoration of the suspended constitution of 1875; next day, further *iradés* abolished espionage and the censorship, and ordered the release of political prisoners. On Dec. 10 the sultan opened the Turkish parliament with a speech from the throne in which he said that the first parliament had been "temporarily dissolved until the education of the people had been brought to a sufficiently high level by the extension of instruction throughout the empire."

The correct attitude of the sultan did not save him from the suspicion of intriguing with the powerful reactionary elements in the State, a suspicion confirmed by his attitude towards the counter-revolution of April 13, when an insurrection of the soldiers and the Muslim populace of the capital overthrew the committee and the ministry. The committee, restored by the Salonika troops, now decided on Abdul-Hamid's deposition, and on April 27 his brother Reshid Effendi was proclaimed sultan as Mohammed V. The ex-sultan was confined at Salonika. When Salonika capitulated to the Greeks in the Balkan War (1912) Abdul-Hamid was brought back to Constantinople. In 1915 he was removed to Magnesia, in Asia Minor, where he died on Feb. 10, 1918.

See Sir E. Pears, *Life of Abdul-Hamid* (1917); C. Hacquard, *La Turquie sous Abdul-Hamid II.* (Brussels, 1901).

ABDULINO, town in Samara province of R.S.F.S.R. Pop. (1926), 13,690. It is situated on the boundary between Samara and Bashkiria on the Uk river, north of the railway from Samara to Ufa and is a market for local products.

ABDUL MEJID (ahbd-ōöl mē-jēd') (1823-1861), sultan of Turkey, was born April 23, 1823, and succeeded his father, Mahmud II., on July 2, 1839. Mahmud appears to have been unable to effect the reforms he desired in the mode of educating his children, so that his son received no better education than that usually given to Turkish princes in the harem. Abdul Mejid succeeded to the throne at a moment of crisis. The news was on its way to Constantinople that the Turkish army had been defeated at Nezib by that of the rebel Egyptian viceroy, Mohammed Ali; and the Turkish fleet was on its way to Alexandria, where it was handed over by its commander, Ahmed Pasha, to the enemy, on the pretext that the young sultan's advisers were sold to Russia. Through the intervention of the European Powers Mohammed Ali was obliged to come to terms, and the Ottoman Empire was saved. See MOHAMMED ALI.

Abdul Mejid set at once about carrying out the reforms to which Mahmud had devoted himself. In Nov. 1839 was proclaimed an edict, known as the *Tanzimat*, or *Hatt-i-sherif* of Gulhané, consolidating and enforcing these reforms; this was supplemented at the close of the Crimean War by a similar statute issued in Feb. 1856. These enactments provided that all classes of the sultan's subjects should have security for their lives and property; that taxes should be fairly imposed and justice impartially administered; and that all should have full religious liberty and equal civil rights. The scheme was opposed by the governing classes and the *ulema*, or privileged religious teachers, and was but partially put in force, especially in the remoter parts of the empire; and more than one conspiracy was formed against the sultan's life on account of it.

Of the other measures of reform promoted by Abdul Mejid the more important were: the institution of a council of public instruction (1838), the reorganization of the army (1843-44), and of a ministry of public instruction (1857), the abolition of an odious and unfairly imposed capitation tax, the repression of slave trading, and various provisions for the better administration of the public service and for the advancement of commerce, including the establishment of a mixed commercial court at Constantinople. For the general history of his times—the disturbances and insurrections in different parts of his dominions throughout his reign, and the great war successfully carried on against Russia by Turkey, and by Britain, France and Sardinia, in the interest of Turkey (1853-56)—see TURKEY and CRIMEAN WAR. When Kossuth and others sought refuge in Turkey, after the failure of the Hungarian rising in 1849, the sultan refused to surrender them. It is to his credit, too, that he would not allow the conspirators against his own life to be put to death. He was described as a kind and honourable man, if somewhat weak and easily led.

His extravagance, especially towards the end of his life, was excessive. He died on June 25, 1861, and was succeeded by his brother, Abdul Aziz (*q.v.*), as the oldest survivor of the family of Osman. He left several sons, of whom two, Murad V. and Abdul Hamid II., eventually succeeded to the throne.

ABDUR RAHMAN KHAN (c. 1844-1901), amir of Afghanistan, was the son of Afzul Khan, who was the eldest son of Dost Mohammed Khan, the famous amir, by whose success in war the Barakzai family established their dynasty in the rulership of Afghanistan. Before his death at Herat, June 9, 1863, Dost Mohammed had nominated as his successor Shere Ali, his third son, passing over the two elder brothers, Afzul Khan and Azim Khan; and at first the new amir was quietly recognized. But after a few months Afzul Khan raised an insurrection in the northern province, between the Hindu Kush mountains and the Oxus, where he had been governing when his father died; and then began a fierce contest for power among the sons of Dost Mohammed which lasted for nearly five years. In this war Abdur Rahman soon became distinguished for ability and daring energy. Although his father, Afzul Khan, who had none of these qualities, came to terms

with the Amir Shere Ali, the son's behaviour in the northern province soon excited the amir's suspicion, and Abdur Rahman, when he was summoned to Kabul, fled across the Oxus into Bukhārā. Shere Ali threw Afzul Khan into prison, and a serious revolt followed in south Afghanistan; but the amir had scarcely suppressed it when Abdur Rahman's reappearance in the north was a signal for a mutiny of the troops stationed in those parts and a gathering of armed bands to his standard. After some delay and desultory fighting, he and his uncle, Azim Khan, occupied Kabul (March 1866). The amir Shere Ali marched up against them from Kandahar; but in the battle that ensued at Sheikhabad on May 10, he was deserted by a large body of his troops, and was defeated. Abdur Rahman then released his father, Afzul Khan, from prison in Ghazni and installed him as amir of Afghanistan. Notwithstanding the new amir's incapacity and some jealousy between the real leaders, Abdur Rahman and his uncle, they again routed Shere Ali's forces and occupied Kandahar in 1867; and when at the end of that year Afzul Khan died Azim Khan succeeded to the rulership, with Abdur Rahman as his governor in the northern province. But towards the end of 1868 Shere Ali's return and a general rising in his favour, resulting in their defeat at Tinah Khan on Jan. 3, 1869, forced them both to seek refuge in Persia, whence Abdur Rahman proceeded afterwards to place himself under Russian protection at Samarkand. Azim died in Persia in Oct. 1869.

In 1893 the amir showed his usual ability in the settlement of the frontier question with Sir Henry Durand's mission. Abdur Rahman died on Oct. 1, 1901, being succeeded by his son Habibullah. (See AFGHANISTAN: *History*.)

See also S. Wheeler, F.R.G.S., *The Amir Abdur Rahman* (1895); J. A. Grey, *At the Court of the Amir* (1895); *The Life of Abdur Rahman, Amir of Afghanistan*, G.C.B., G.C.S.I., edited by Mir Munshi, Sultan Mohammed Khan (1900).

ABECEDARIANS, a nickname given to certain extreme Anabaptists (*q.v.*), who regarded the teaching of the Holy Spirit as all that was necessary, and so despised all human learning and even the power of reading the written word (from "A, B, C, D").

À BECKETT, GILBERT ABBOTT (1811-1856), English humorous writer, was born in north London on Jan. 9, 1811. He belonged to a family claiming descent from the father of St. Thomas Becket. His elder brother, Sir William à Beckett (1806-1869), became chief justice of Victoria (Australia). Gilbert Abbott à Beckett was educated at Westminster School, was called to the bar at Gray's Inn in 1841, and in 1849 became a metropolitan police magistrate. He edited *Figaro in London*, and was one of the original staff of *Punch* and a contributor all his life. He produced some 50 or 60 plays, among them dramatized versions of Dickens's shorter stories in collaboration with Mark Lemon. He died at Boulogne Aug. 30, 1856.

His eldest son, GILBERT ARTHUR À BECKETT (1837-1891) was born at Hammersmith on April 7, 1837. On leaving Christ Church, Oxford, he was entered at Lincoln's Inn, but gave his attention chiefly to the drama, producing *Diamonds and Hearts* at the Haymarket in 1867, which was followed by other light comedies. His pieces include numerous burlesques and pantomimes, the libretti of *Savonarola* (Hamburg, 1884) and of *The Canterbury Pilgrims* (Drury Lane, 1884) for the music of Dr. (afterwards Sir) C. V. Stanford. *The Happy Land* (Court Theatre, 1873), a political burlesque of W. S. Gilbert's *Wicked World*, was written in collaboration with F. L. Tomline. For the last ten years of his life he was on the regular staff of *Punch*. He died on Oct. 15, 1891.

A younger son, ARTHUR WILLIAM À BECKETT (1844-1909), a well-known journalist and a man of letters, was also on the staff of *Punch* from 1874-1902, and gave an account of his father and his own reminiscences in *The À Becketts of Punch* (1903). He died in London on Jan. 14, 1909.

See also M. H. Spielmann, *The History of Punch* (1895).

ABEDNEGO, the name given in Babylon to Azariah, one of the companions of Daniel (Dan. i. 7, etc.). Probably a corruption of Abednebo, "servant of Nebo," or perhaps of Abednego for Abednergal, "servant of the god Nergal."

ABEKEN, HEINRICH (1809-1872), German theologian and Prussian official, was born at Berlin on Aug. 8, 1809. In 1848

he entered the Prussian ministry for foreign affairs, and in 1853 was promoted to be privy councillor of legation (Geheimer Legationsrath). He was employed by Bismarck in the writing of official despatches, and often accompanied King William on his journeys as representative of the foreign office and was with him during the campaigns of 1866 and 1870-71.

See *Heinrich Abeken, ein schlichtes Leben in bewegter Zeit* (1898), by his widow. English translation by Mrs. C. E. Barrett-Lennard and M. W. Hofer (with portraits 1911). This is valuable by reason of the letters written from the Prussian headquarters.

ABEL, a city in Maacah, one of the genuinely "Israelite" cities (see 2 Sam. xx. 18). The question of the Aramaean and Edomite composition of Israel involves a consideration of the territories occupied in early times by the tribes and their progenitor (Deut. xxvi. 5). Abel and Dan were considered as definitely Israelite cities (see *The Cambridge Ancient History*, 1926, vol. ii., pp. 368-69).

ABEL (Hebrew Hebel, *breath*), second son of Adam, slain by Cain, his elder brother (Gen. iv. 1-15). The narrative in Genesis is supplemented in the New Testament ("By faith Abel offered unto God a more excellent sacrifice than Cain," Heb. xi. 4; Cain slew Abel "because his own works were evil, and his brother's righteous," 1 John iii. 12). The name probably means "herdsman" (cf. Jabal), as distinguished from the agriculturist Cain. Possibly Abel was originally a South Judæan demigod or hero; see Winckler, *Gesch. Israels*, ii. p. 189; E. Meyer, *Israeliten*, p. 395. Augustine (*De Haeresibus*, lxxvii.) mentions a sect of *Abelitæ*, in northern Africa.

ABEL, SIR FREDERICK AUGUSTUS, BART. (1827-1902), English chemist, was born in London on July 17, 1827. After studying chemistry for six years under A. W. von Hofmann at the Royal College of Chemistry (established in London in 1845), he became professor of chemistry at the Royal Military academy in 1851, and three years later was appointed chemist to the War Department and chemical referee to the government. During his tenure of this office, which lasted until 1888, he carried out a large amount of work in connection with the chemistry of explosives. He developed an improved and safer process for the manufacture of gun-cotton, and prepared the way for the "smokeless powders" which came into general use towards the end of the 19th century; cordite, the particular form adopted by the British government in 1891, was invented jointly by him and Professor James Dewar. In conjunction with Sir Andrew Noble he carried out one of the most complete enquiries on record into the behaviour of ordinary black powder when fired. The invention of the apparatus, legalized in 1879, for the determination of the flash-point of petroleum, was also his work. His first instrument, the open-test apparatus, was prescribed by the Act of 1868, but was superseded in 1879 by the Abel close-test instrument. In electricity Abel studied the construction of electrical fuses and other applications of electricity for war purposes, and his work on problems of steel manufacture won him in 1897 the Bessemer medal of the Iron and Steel institute, of which from 1891 to 1893 he was president. He took an important part in the work of the Inventions Exhibition (London) in 1885, and in 1887 became organizing secretary and first director of the Imperial institute, a position which he held till his death, which took place in London, Sept. 6, 1902. He was knighted in 1891, and was created a baronet in 1893.

Among his books were *Handbook of Chemistry* (with C. L. Bloxam), *Modern History of Gunpowder* (1866), *Gun-cotton* (1866), *On Explosive Agents* (1872), *Researches in Explosives* (1875), and *Electricity applied to Explosive Purposes* (1884). He also wrote several important articles in the 9th ed. of the *Encyclopædia Britannica*.

ABEL, JOHN JACOB (1857-), American pharmacologist and physiological chemist, was born in Cleveland, O., on May 19, 1857. He began life as a teacher and in 1879-82 was a principal and superintendent of schools in Indiana. In 1883 he graduated from the University of Michigan and, after a year at Johns Hopkins university, he devoted six years (1884-90) to the study of chemistry and medicine at Berlin, Strasbourg, Vienna and other European universities. He was lecturer on materia medica in the University of Michigan in 1890-91 and then entered

the faculty of Johns Hopkins university in which in 1893 he became professor of pharmacology and physiological chemistry. He made extensive investigations of the chemical composition of animal tissues and fluids, and also of the function and isolation of special chemical principles of the animal organism. A noteworthy example of the latter was his isolation of the blood-pressure-raising constituent of the suprarenal glands (epinephrine) in the form of a benzoyl derivative. He made researches also on carbamic acid, the action of phthaleins, the poisons of mushrooms, albumoses in the tissues, hydrolytic products of proteins, histamin, insulin and various related subjects, in connection with which he has published many important papers. In recognition of his contributions to science he was awarded the Willard Gibbs medal in 1927.

ABEL, KARL FRIEDRICH (1725-87), German musician, was born in Cöthen and died in London, where he lived during the greater part of his career. He was a great player on the viola da gamba, composed much music for that instrument and was one of the most prominent figures in the London musical life of his day. He studied under Johann Sebastian Bach at the Leipzig Thomasschule; played for ten years (1748-58) under A. Hasse in the band formed at Dresden by the elector of Saxony; and then, going to England, became (in 1759) chamber-musician to Queen Charlotte. The friendship between Johann Christian Bach, 11th son of Sebastian, who had also settled in London, and Abel led, in 1764 or 1765, to the establishment, at first under the auspices of the notorious Mrs. Cornelys, of the famous concerts subsequently known as the Bach and Abel concerts. The Hanover Square Rooms were opened, on Feb. 1, 1775, by one of these concerts, at which, too, Haydn's symphonies were first performed in England. He was a man of striking presence, as several fine portraits, including two by Gainsborough, attest.

ABEL, NIELS HENRIK (1802-29), Norwegian mathematician, was born at Findöe, Aug. 25, 1802, and educated at Christiania. His first notable work was a proof of the impossibility of solving the quintic equation by radicals. State aid enabled him to visit Germany and France in 1825. He spent six months in Berlin, where he became intimate with August Leopold Crelle, who was then about to publish his mathematical journal. From Berlin he passed to Freiburg, where he made his brilliant researches in the theory of elliptical functions. In 1826 he moved to Paris. Want of money finally compelled him to abandon his tour, and on his return to Norway he taught for some time at Christiania. In 1829 Crelle obtained a post for him at Berlin, but the offer did not reach Norway until after his death near Arendal, April 6.

The early death of this talented mathematician, of whom Legendre said "*quelle tête celle du jeune Norvégien!*" cut short a career of extraordinary brilliance and promise. Under Abel's guidance, the prevailing obscurities of analysis began to be cleared, new fields were entered upon and the study of functions advanced. His works, the greater part of which originally appeared in *Crelle's Journal*, were edited by Holmboë and published in 1839 by the Swedish Government, and a more complete edition by L. Sylow and S. Lie was published in 1881.

See C. A. Bjerknes, *Niels Henrik Abel: Tableau de sa vie et son action scientifique* (1885); Lucas de Peslouan, *Niels Henrik Abel* (1906).

ABEL, THOMAS (better ABELL) (d. 1540), an English priest who was martyred during the reign of Henry VIII., and beatified by Pope Leo XIII. In 1533, he published his *Invicta Veritas* (with the fictitious pressmark of Luneberge to avoid suspicion) in answer to the tracts supporting Henry's ecclesiastical claims. After an imprisonment of more than six years, Abel was sentenced to death for denying the royal supremacy in the church, and was executed at Smithfield on July 30, 1540.

See J. Gillow's *Bibl. Dictionary of Eng. Catholics*, vol. i.; *Calendar of State Papers of Henry VIII.*, vol. iv.-vii. *passim*.

ABÉLARD, PETER (1079-1142), scholastic philosopher, was born in Pallet (Palais), not far from Nantes, in 1079. He was the eldest son of a noble Breton house. He studied first under

Roscelin, the extreme nominalist, and then went to the cathedral school of Notre Dame, whose master was William of Champeaux, the disciple of St. Anselm, and most advanced of realists. After a short time he overcame the master in discussion, and thus began a long duel that issued in the downfall of the philosophic theory of realism, till then dominant in the early middle ages.

When William procured his expulsion from Paris, he set up a school of his own at Melun, whence he removed to Corbeil, nearer Paris, finally becoming master of the school of St. Geneviève. He next turned to theology and attended the lectures of Anselm at Laon. His triumph over the theologian was complete; the pupil was able to give lectures, without previous training or special study, which were more popular than those of the master. Abélard was now at the height of his fame. In 1115 he was made canon and master of Notre Dame, whither the fame of his learning and his personal charm drew students from all countries. (Fulk of Deuil, *Ep. ad Abaelardum*.)

Few teachers ever held such sway as Abélard now did for a time; but a change in his fortunes was at hand. He fell in love with the beautiful and learned Héloïse, niece of Canon Fulbert, and seduced her. After the birth of their son, they were secretly married, though Héloïse appealed to Abélard not to sacrifice his independence and chances of advancement. When the marriage became known, Héloïse returned to the convent of Argenteuil. Fulbert, believing that Abélard planned to be rid of her, took a barbarous revenge, breaking into his chamber by night and perpetrating upon him the most brutal mutilation. Abélard, in despair, became a monk at St. Denys and Héloïse took the veil.

After a year Abélard opened a school of theology at the priory of Maisoncelle (1120). His lectures were heard again by crowds of students, and all his old influence seemed to have returned; but old enmities were revived also. His adversaries fell foul of his rationalistic interpretation of the Trinitarian dogma. Charging him with the heresy of Sabellius in a provincial synod held at Soissons in 1121, they procured a condemnation of his teaching, made him burn his book, and shut him up in the convent of St. Médard at Soissons. When he returned to St. Denys, another dispute arose. He cited Bede to prove that Dionysius the Areopagite had been bishop of Corinth, and not, as the monks held, bishop of Athens. When this historical heresy led to the inevitable persecution, Abélard withdrew to a desert place near Nogent-sur-Seine and turned hermit. His retreat becoming known, students flocked to him from Paris, and in gratitude for the consolation they brought him, he consecrated the new oratory they built for him by the name of the Paraclete.

Upon the return of new dangers, or at least of fears, Abélard accepted an invitation to preside over the abbey of St. Gildas de Rhuys, in Lower Brittany. The abbey was poor, disorderly and depraved; yet for nearly ten years he endured it, and it was only under peril of violent death that he fled from his charge. Meanwhile he had been able, on the breaking up of Héloïse's convent at Argenteuil, to establish her as head of a new religious house at the deserted Paraclete. After his flight from St. Gildas, he wrote, among other things, his famous *Historia Calamitatum*, and thus moved Héloïse to pen her three *Letters*, which have kept their place among the great love letters of the world. In 1136 he was lecturing on Mount St. Geneviève (when he was heard by John of Salisbury), but it was only for a brief space. As far back as the Paraclete days he had been the opponent of Bernard of Clairvaux, who upheld the principle of fervent and unhesitating faith, from which rational inquiry like his was sheer revolt, and Abélard now came into conflict with this uncompromising spirit. In 1141 a council met at Sens, before which Abélard, formally arraigned upon a number of heretical charges, was prepared to plead his cause; but when Bernard had opened the case, suddenly Abélard appealed to Rome. The stroke availed him nothing; for Bernard, who had power, notwithstanding, to get a condemnation passed at the council, did not rest till a second condemnation was procured at Rome in the following year. Meanwhile, on his way thither to urge his plea in person, Abélard had broken down at the abbey of Cluny, and there, an utterly fallen man, only not bereft of his intellectual force, he lingered but a few months. Removed

for the relief of his sufferings to the priory of St. Marcel, near Chalon-sur-Saône, he died April 21, 1142. Héloïse died in 1164, and the two now lie in the well-known tomb in the cemetery of Père Lachaise in Paris.

Great as was the influence exerted by Abélard on the minds of his contemporaries and the course of mediaeval thought, he has been little known in modern times but for his relations with Héloïse. Indeed, it was not till 1836, when Cousin issued the collection entitled *Ouvrages inédits d'Abélard*, that his philosophical performance could be judged at first hand; of his strictly philosophical works only one, the ethical treatise *Scito te ipsum*, having been published earlier (1721). Cousin's collection, besides giving extracts from the theological work *Sic et Non* (an assemblage of opposite opinions on doctrinal points, culled from the Fathers as a basis for discussion, the main interest in which lies in the fact that there is no attempt to reconcile the different opinions), includes the *Dialectica*, commentaries on logical works of Aristotle, Porphyry and Boëthius, and a fragment, *De Generibus et Speciebus*, which, with the psychological treatise *De Intellectibus* (published apart by Cousin in *Fragmens Philosophiques*, vol. ii.) is now considered upon internal evidence not to be by Abélard himself. A genuine work, the *Glossulae super Porphyrium*, from which Charles de Rémusat, in his classical monograph *Abélard* (1845), has given extracts, remains in manuscript.

The general importance of Abélard lies in his having fixed more decisively than anyone before him the scholastic manner of philosophizing, with its object of giving a formally rational expression to the received ecclesiastical doctrine. However his own particular interpretations may have been condemned, they were conceived in essentially the same spirit as the general scheme of thought afterwards elaborated in the 13th century with approval from the heads of the church. Through him was prepared the ascendancy of the philosophical authority of Aristotle, which became firmly established in the half-century after his death, when first the completed *Organon*, and gradually all the other works of the Greek thinker, came to be known in the schools; before his time it was rather upon the authority of Plato that the prevailing realism sought to lean. As regards his so-called conceptualism and his attitude to the question of universals, see SCHOLASTICISM.

Outside of his dialectic, it was in ethics that Abélard showed greatest activity of philosophical thought, laying very particular stress upon the subjective intention as determining, if not the moral character, at least the moral value, of human action. His thought in this direction, wherein he anticipated something of modern speculation, is the more remarkable because his scholastic successors hardly ventured to bring the principles and rules of conduct under pure philosophical discussion, even after the ethical inquiries of Aristotle became known to them.

BIBLIOGRAPHY.—Abélard's own works remain the best sources for his life, especially his *Historia Calamitatum*, an autobiography, and the correspondence with Héloïse. Charles de Rémusat's *Abélard* (1845) remains an authority; it must be distinguished from his drama *Abélard* (1877). McCabe's life of Abélard is written closely from the sources. See also U. Chevalier, *Répertoire des sources hist. du moyen âge*, "Abailard," (bibl.), and H. Rashdall, *Universities of Europe in the Middle Ages* (Oxford, 1895). A new translation of the famous *Letters* of Héloïse, by George Moore, appeared in 1926.

ABELIN, JOHANN PHILIPP, (d. c. 1635) German chronicler. He wrote numerous histories over the pseudonyms of Philipp Arlanibäus, Abeleus and Johann Ludwig Gottfried or Gotofredus. His best known work is the *Theatrum Europaeum*, a series of chronicles of the chief events in the history of the world down to 1619. He compiled the first two volumes. It was continued by various writers and grew to 21 volumes (Frankf. 1633–1738). The chief interest of the work is its illustration by the beautiful copperplate engravings of Matthäus Merian (1593–1650).

See G. Droysen, *Arlanibaeus, Godofredus, Abelinus* (1864); and notice in *Allgemeine Deutsche Biographie*.

ABELL, SIR WESTCOTT STILE (1877–), naval engineer, chief ship surveyor at Lloyds Register of Shipping. From 1910–14 he was professor of naval architecture at the Uni-

versity of Liverpool. A member of various boards, including two committees of the Board of Trade, on the Internationalization of the Load Line of Ships in 1913, and on Shipping and Shipbuilding in 1916, he became technical adviser to the Controller of Shipping in 1917, and was president of the Institute of Marine Engineers 1924-25. He was given a K.B.E. in 1920. His writings include *The Ship and her Work* and contributions to the *Transactions of the Naval Institute of Architects*, etc.

ABEL TEST, the close-test process of determining the flash-point of petroleum, invented by Sir Frederick Abel and embodied in the British Petroleum Act of 1879. The test is employed to ascertain whether a sample of petroleum may be safely used at a given temperature.

The Abel apparatus simply raises the temperature of the sample under test until the resultant combination of oil vapour and air forms an explosive mixture and causes a flash. The minimum limit of flash-point under British law is 73°, and most civilized countries have provided a similar test of inflammability. (See *PETROLEUM*.)

ABENCERRAGES, a family or faction that is said to have held a prominent position in the Moorish kingdom of Granada in the 15th century. The name appears to have been derived from Yussuf-ben-Serragh, the head of the tribe in the time of Mohammed VII. It is familiar from the interesting romance of Ginés Perez de Hita, *Guerras civiles de Granada*, which celebrates the feuds of the Abencerrages and the rival family of the Zegrís. The hall of the Abencerrages in the Alhambra takes its name from being the reputed scene of the massacre of the family.

ABENDANA, the name of two Jewish theologians. (1) JACOB (1630-95), rabbi (Hakham) of the Spanish Jews in London from 1680. (2) ISAAC (c. 1650-1710), his brother, teacher of Hebrew at Cambridge and afterwards at Oxford. He compiled a Jewish Calendar and wrote *Discourses on the Ecclesiastical and Civil Policy of the Jews* (1706).

ABENEZRA (Ibn Ezra), whose full name was Abraham ben Meir Ibn Ezra (1092 or 1093-1167), Jewish poet and scholar, was a native of Toledo. He had already gained a reputation as a thinker and poet before he left Spain, some time before 1140, and began the travels in northern Africa, in England, France and Italy which extended over a quarter of a century. He translated the writings of Hayyuj, the father of modern Hebrew grammar, from Arabic into Hebrew, and himself wrote treatises on the subject, the most important of which are *Moznayim* ("the Scales"), written in 1140, and *Zahot* ("Correctness"), written in 1141. His writings include works on philosophy, astronomy and mathematics, but his fame is derived chiefly from his commentaries on the Scriptures. Ibn Ezra sought to establish the simple sense of the text, basing his interpretation on solid grammatical principles. The commentary on the Pentateuch was first printed at Naples in 1488; in this edition a second commentary on Exodus takes the place of the original one. The great editions of the Hebrew Bible contain other commentaries by Ibn Ezra on Isaiah, the Minor Prophets, Job and Daniel, and his name was attached to commentaries on Proverbs, Ezra and Nehemiah, which were really the work of Moses Kimhi. The *Yôsôd Mëra* (1158), the best known of his writings on the philosophy of religion, explains the reasons for the biblical commandments.

BIBLIOGRAPHY.—Among the literature on Ibn Ezra may be especially mentioned: M. Friedländer, *Essays on the Writings of Ibn Ezra* (London, 1877); W. Bacher, *Abraham Ibn Ezra als Grammatiker* (Strasburg, 1882); M. Steinschneider, *Abraham Ibn Ezra*, in the *Zeitschrift für Mathematik und Physik*, Band xxv. Supplement; D. Rosin, *Die Religionsphilosophie Abraham Ibn Ezra's* in vols. xlii. and xliii. of the *Monatschrift für Geschichte und Wissenschaft des Judentums*; his *Divan* was edited by T. Egers (Berlin, 1886); a collection of his poems, *Reime und Gedichte*, with translation and commentary, were published by D. Rosin in several annual reports of the Jewish theological seminary at Breslau (1885-94).

ABENSBURG, a town and spa of Germany, in Bavaria, on the Abens, a tributary of the Danube, 18m. S.W. of Regensburg. Pop. (1925) 2,256. Some Roman remains exist in the neighbourhood of the town, which was known to the Romans as *Castra Abusina*. Here Napoleon defeated the Austrians under the Archduke Louis and Gen. Hiller on April 20, 1809.

ABEOKUTA, a town of British West Africa, the capital of the Egba division of the Yoruba people and of the province of Abeokuta, southern Nigeria. It is situated in 7° 8' N., 3° 25' E., on the Ogun river, 64m. north of Lagos by railway, or 81m. by water. Population (1921 census) 38,034. Abeokuta is surrounded by mud walls 18m. in extent and lies in a beautiful and fertile country, the surface of which is broken by masses of grey granite. Besides the usual mud built houses there are several buildings (including public offices) of modern design. Palm-oil, timber, yams and shea-butter are the chief articles of trade.

Abeokuta (a word meaning "under the rocks"), dating from 1825, owes its origin to incessant inroads of slave-hunters from Dahomey and Ibadan, which compelled the village populations to take refuge in this rocky stronghold, which became the capital of the Egba State, the ruling chief being styled *Alake* (Ake is the principal quarter of Abeokuta and is the name of the ancient Egba capital). The Egba carried on a long war with Ibadan, and claimed the right to close the trade routes to Lagos. This brought them from 1865 onward into collision with the British, but in 1893 a treaty was signed which, while preserving Egba independence in internal affairs, brought the State under direct British influence. Christian missions had been in Abeokuta since 1843 and gained many converts; in 1867 the Christians were expelled. They returned some years later and now form an influential part of the population. The town is the headquarters of the Yoruba branch of the Church Missionary Society.

After 1899 when the railway from Lagos reached Abeokuta there was a large increase in trade. Meanwhile the Egbas had set up a government based on European models, and in 1904 the *Alake* created some interest in his country by a visit to England. But side by side with an administration on modern lines (including fiscal barriers) "there existed," to quote Sir F. D. Lugard, "the ancient régime with all its abuses—extortionate demands from the peasantry, corruption and bribery in the courts, arbitrary imprisonment and forced labour." These conditions could not be tolerated and in 1914 by a new agreement the Egbas renounced "independence," and their country, with Jebu and other districts, was constituted the province of Abeokuta. Since then the *Alake* and his council have carried on the native administration under the supervision of a British resident. In 1917 a somewhat serious rising occurred in the province; it was the only instance of the peace being disturbed in Nigeria during the World War.

See Sir F. D. Lugard's *Report on Nigeria* (pub. in 1920) as a White Paper (cmd. 468); an article on Abeokuta by Sir Wm. Macgregor, *African Society's Journal* No. xii. (July, 1904); and Sir W. N. Geary, *Nigeria under British Rule* (1927).

ABERAVON: see PORT TALBOT.

ABERCARN, urban district, Monmouthshire, England. Pop. (1931) 20,554. It is situated in the middle portion of the Ebbw valley and like the other towns of the north and east of the coalfield had an early association with iron smelting, and then relied more and more on the export of coal, but tin plates are manufactured in large quantities. Like the other towns of the coalfield, it is mainly a long street along the valley. It has shared the deep industrial depression in the neighbourhood since 1918. Abercarn has a station on the Great Western railway branch line from Newport and is in the Abertillery parliamentary division.

ABERCORN, JAMES HAMILTON, 1ST EARL OF (c. 1575-1618), was the eldest son of Claud Hamilton, Lord Paisley (4th son of James, 2nd Earl of Arran, and Duke of Chatelherault), and of Margaret, daughter of George, 6th Lord Seton. He was made sheriff of Linlithgow in 1600, received large grants of lands in Scotland and Ireland, was created in 1603 Baron of Abercorn, and on July 10, 1606 was rewarded for his services in the matter of the union by being made Earl of Abercorn, and Baron Hamilton, Mount Castle and Kilpatrick. He married Marion, daughter of Thomas, 5th Lord Boyd, and left five sons, of whom the eldest, Baron of Strabane, succeeded him as 2nd Earl of Abercorn. He died on March 23, 1618. The title of Abercorn, held by the head of the Hamilton family, became a marquissate in 1790, and a dukedom in 1868.

ABERCORN, JAMES HAMILTON, 2ND DUKE OF (1838-1913), British politician, born on Aug. 24, 1838, succeeded his father, the 1st Duke, in 1885. His sister, the Duchess of Buccleuch, was for many years mistress of the robes to Queen Victoria and to Queen Alexandra. The duke became a member of the household of the Prince of Wales (afterwards Edward VII.). He was a strong supporter of the Unionist Party in the House of Lords, and was chairman of the British South Africa Company. He died in London on Jan. 3, 1913.

ABERCORN, JAMES ALBERT EDWARD HAMILTON, 3RD DUKE OF (1869-), British politician, son of the preceding, was born on Nov. 1, 1869, and was educated at Eton. Lord James Hamilton was M.P. for Londonderry, 1900-13, a leader of the Unionist Party in Ulster, and treasurer of H.M. Household in 1903-05. After the passage of the Government of Ireland Act, he became a senator of Northern Ireland, and in 1922 was appointed governor.

ABERCROMBIE, LASCELLES (1881-), English poet, was born at Ashton-upon-Mersey, Cheshire, Jan. 9, 1881, and educated at Malvern and Victoria university, Manchester, where he studied science. His first work, *Interludes and Poems*, appeared in 1908. Other works are: *Mary and the Bramble* (1910); *The Sale of St. Thomas* (1911); *Emblems of Love* (1912); *Deborah* (1912); *Speculative Dialogues* (1913). He was appointed lecturer in poetry at the University of Liverpool (1919) and in English literature at Leeds (1922).

Professor Abercrombie was more concerned with bringing his students to the study of the essential greatness of the writers with whom he dealt than with the details which are apt to encumber overmuch the study of literature. His critical study of *Thomas Hardy* (1912), the *Theory of Poetry* (1924), and his volume of collected lectures, *The Idea of Great Poetry* (1925), are important contributions to modern critical literature. His works include some plays in blank verse, among them *Phoenix* (1923).

ABERCROMBY, DAVID, a 17th century Scottish physician. His *Nova medicinae praxis* was reprinted after his death in Paris (1740). His *Tuta ac efficax luis venereae saepe absque mercurio ac semper absque salivatione mercuriali curando methodus* (1684) was translated into French, Dutch and German. In his *Discourse on Wit* (1685) he expounds the Scottish philosophy of common sense. The exact date of his death is unknown, but according to Haller he was alive early in the 18th century.

ABERCROMBY, PATRICK (1656-c. 1716), Scottish physician and author, was born at Forfar, and educated at St. Andrews. He is best known as the author of the *Martial Achievements of the Scots Nation* (fol. 1711-16), in which he had the assistance of many learned contemporaries. As a pamphleteer on behalf of the Union he crossed swords with Daniel Defoe.

ABERCROMBY, SIR RALPH (1734-1801), British soldier, eldest son of George Abercromby, of Tullibody, Clackmannanshire, was born Oct. 7, 1734. Educated at Rugby and at Edinburgh University, he was sent in 1754 to Leipzig to study civil law, with a view to his proceeding to the Scottish bar. But he received a commission in the 3rd Dragoon Guards in March 1756. He served with his regiment in the Seven Years' War, and study of the methods of the great Frederick moulded his military character and formed his tactical ideas. In 1781 he became colonel of the King's Irish infantry. When that regiment was disbanded in 1783, he retired upon half pay. Hitherto he had scarcely been engaged in active service, mainly because of his disapproval of the policy of the Government, and especially because of his sympathies with the American colonists in their struggles for independence; and his retirement was no doubt the result of similar feelings. But on the declaration of war by France against England in 1793, he returned to the Army, and was appointed to the command of a brigade under the Duke of York, for service in Holland. He commanded the advanced guard in the action at Le Cateau, and was wounded at Nijmegen. The duty fell to him of protecting the British Army in its disastrous retreat out of Holland in the winter of 1794-95. In 1795 he received a knighthood of the Bath, and in the same

year he was appointed to succeed Sir Charles Grey as commander-in-chief of the British forces in the West Indies. In 1796 he seized Grenada, and then took the settlements of Demerara and Essequibo, and the islands of St. Lucia, St. Vincent and Trinidad. He held, in 1797-98, the chief command of the forces in Ireland. He sought to restore the discipline of the army, and declined to allow the military to be called out, except when it was indispensable for the maintenance of order. Finding that all his efforts were thwarted by the Government in Ireland, he resigned the command. After acting as commander-in-chief in Scotland, Sir Ralph was second-in-command to the Duke of York in the second disastrous expedition to Holland in 1797. In 1801 he was sent with an Army to turn the French out of Egypt. The disembarkation on March 2 of the troops at Aboukir Bay, in the face of strenuous opposition, is justly ranked among the most daring and brilliant exploits of the British Army. The French made a surprise attack on the British camp near Alexandria (March 21, 1801), and Abercromby fell in the moment of victory. He was struck by a spent ball, which could not be extracted, and died on board the flagship seven days after the battle. By a vote of the House of Commons, a monument was erected in his honour in St. Paul's Cathedral. His widow was created Baroness Abercromby of Tullibody and Aboukir Bay, and a pension of £2,000 a year was settled on her and her two successors in the title.

A memoir of the later years of his life (1793-1801) by his third son, James (who was Speaker of the House of Commons, 1835-39, and became Lord Dunfermline), was published in 1861. For a shorter account of Sir Ralph Abercromby see Wilkinson, *Twelve British Soldiers* (London, 1899).

ABERDARE, HENRY AUSTIN BRUCE, 1ST BARON (1815-95), English statesman, was born at Duffryn, Aberdare, Glamorganshire, on April 16, 1815. He was called to the bar in 1837, and was stipendiary magistrate for Merthyr Tydvil and Aberdare, 1847-52. The discovery of coal in the Duffryn and Aberdare estates of the family made him a rich man. He sat in the House of Commons for Merthyr Tydvil from 1852-68 and for Renfrewshire from 1869-73, when he became a peer. He was under-secretary at the Home Office (1862-64), vice-president of the board of education (1864-66), home secretary (1868-73), and lord president of the council (1873-74). After the defeat of the Liberal Government in 1874 Lord Aberdare turned to social and economic questions. From 1882, when he became chairman of the National African Company incorporated under charter in 1886 as the Royal Niger Company, he was closely associated with West African affairs. He presided over several royal commissions, and promoted university education in Wales. He died in London on Feb. 25, 1895.

ABERDARE, industrial town of north Glamorganshire, Wales, situated, as its name implies, at the confluence of the Dar and Cynon (the latter being a tributary of the Taff). Population (1931) 48,751. The neighbouring moorlands show evidences of occupation in pre-Roman times, and a site about 4m. to the north-west of the town is reputed to be the scene of a Norman victory over the native forces under Rhys ap Tewdwr in the 11th century. Aberdare remained but a small nucleus among the scattered farms of the moorlands until the beginning of the 19th century when the place grew rapidly owing to the abundance of its coal and iron ore, and the population of the whole parish (which was only 1,486 in 1801) increased tenfold during the first half of the century. Ironworks were established at Llwydcoed and Abernant in 1799 and 1800 respectively, followed by others at Gadlys and Aberaman in 1827 and 1847. The building of the Glamorgan canal in 1811 connected these ironworks with the coast, but the rapid development of the railways superseded the canals and at the same time gave an impetus to the iron trade between 1820 and 1870 and a consequent rapid growth of the town. These ironworks have not been worked since 1875, and the only supplementary industry remaining in the town is a small tinplate works at Gadlys (established in 1868). Previous to 1836, most of the coal worked in the parish was consumed locally, chiefly in the ironworks, but in that year the working of steam coal for export was begun, pits were sunk in rapid succession, and the coal trade, which at

least since 1875 has been the chief support of the town, soon reached huge dimensions. There are also several brickworks and breweries.

Until 1918 Aberdare was included for parliamentary representation with the borough of Merthyr Tydfil, but since that date it returns a member to parliament jointly with the urban district of Mountain Ash.

ABERDEEN, GEORGE GORDON, 1ST EARL OF (1637–1720), lord chancellor of Scotland, was the son of Sir George Gordon of Haddo, who had been executed by the Presbyterians in 1664. He was born Oct. 3, 1637, and studied at Aberdeen and abroad. He was called to the bar in 1668 and gained a great reputation as a lawyer. He was president of the court of session in 1681 and lord chancellor of Scotland from 1682 to 1684. He was created earl of Aberdeen in 1682.

Burnet reflects unfavourably upon him, calls him "a proud and covetous man," and declares "the new chancellor exceeded all that had gone before him." He executed the laws enforcing religious conformity with severity, and filled the parish churches, but resisted the excessive measures of tyranny prescribed by the English government; and in consequence of an intrigue of the Duke of Queensberry and Lord Perth, who gained the duchess of Portsmouth with a present of £27,000, he was dismissed in 1684. He remained a non-juror during the whole of William's reign, and took the oaths for the first time after Anne's accession, on May 11, 1703. In the affair of the Union in 1707, he protested against the completion of the treaty till the act declaring the Scots aliens should be repealed, but refused to support the opposition to the measure itself. He died on April 20, 1720.

Society, vol. xxxvi., 1900); J. Mackay's *Memoirs* (1733), p. 215; A. Lang's *Hist. of Scotland*, iii. 369, 376.

ABERDEEN, GEORGE GORDON, 4TH EARL OF (1784–1860), British statesman, was born in Edinburgh on Jan. 28, 1784, the son of George Gordon, Lord Haddo. At the age of 11, when he was left an orphan, he went to reside with Henry Dundas, afterwards Lord Melville; and three years later he was permitted by Scots law to select William Pitt and Dundas as his curators, or guardians. At Harrow and at St. John's college, Cambridge, he proved himself a gifted classical scholar, though modern history shared his interest; and his education was completed by an extended tour of Europe which took him to the Far East. On the death of his grandfather in 1801 he succeeded to the peerage, and four years later he married Catherine Hamilton, daughter of Lord Abercorn.

His connection with Pitt and Dundas, and his native ability, favoured him for a political career, and in 1812 he travelled as ambassador extraordinary to Austria, where he signed the Treaty of Töplitz in 1813. He remained on the Continent as one of the most active British representatives throughout the negotiations which led to the Treaty of Paris; then he returned to England, and for some years lived in comparative retirement. The year 1815 saw his marriage to Harriet, Lady Hamilton, his first wife having died three years before.

In Jan. 1828 he joined the cabinet of the duke of Wellington, and in the following June he became secretary of state for foreign affairs. Resigning in 1830 with Wellington, he did not again take office until the short administration of 1834 and 1835, when he was colonial secretary to Sir Robert Peel; but in 1841 he joined the latter's cabinet as foreign secretary and commenced the most fruitful and successful period of his public life. He now acquired more power than he had ever possessed with Wellington, to whom he had felt himself subordinate; and this new authority he devoted first to establishing friendly relations with France. Public opinion in both countries exhibited hostility, so that the marriage of Isabella II. of Spain and the imprisonment of Pritchard in Tahiti might have led to a quarrel; but Aberdeen was fortunate in having the confidence of Guizot, and it was largely through their

efforts that a satisfactory understanding was maintained. He was equally successful in avoiding a rupture with the United States, which might easily have resulted from the question involving the boundary between that country and Canada. The north-east frontier was first settled amicably by the Webster-Ashburton Treaty of 1842, but in 1844 the new democratic administration in the States claimed from Britain the whole of the Pacific coast as far as Russian Alaska. To this demand Peel's Government refused to yield, and Aberdeen crowned his successful term at the Foreign Office with the Oregon Treaty of 1846, which fixed the boundary along the forty-ninth degree of latitude.

In 1845 he supported Peel in a proposal to suspend the duty on foreign corn, and left office with him in July 1846. After Peel's death in 1850, Aberdeen was recognized as leader of the Peelites, and in 1852, at the head of a coalition ministry of his own party and the Whigs, he became first lord of the Treasury. Although united on free trade and on questions of domestic reform generally, a cabinet including Lord Palmerston and Lord John Russell, in addition to Aberdeen, was certain to differ on foreign policy; and contemporaries realized that the task of the prime minister was one of unusual difficulty. "In the present cabinet," wrote Charles Greville, in his *Memoirs*, "are five or six men of equal or nearly equal, pretensions . . . every one of these five or six considering himself abler and more important than their premier." Nevertheless, the first year of this administration was successful, and it was due to Aberdeen's steady support that Gladstone's great budget of 1853 was accepted by the cabinet; but the weakness of Aberdeen and of the cabinet soon became apparent in the negotiations which preceded the Crimean War. That the prime minister wished to maintain the peace is unquestionable, but whether he acted wisely to this end is more obscure. His foreign policy was essentially one of peace and non-intervention; but his character is perhaps best described by a writer who says "his strength was not equal to his goodness."

The Vienna note, by which the four powers sought to find terms which were agreeable to both Russia and Turkey, was largely the result of Aberdeen's endeavours; and when Turkey refused to accept the proposed agreement, Aberdeen would not have offered her British support had not the publication of a secret Russian document in Berlin thrown doubt upon the Tsar's intentions. Even then he sought to preserve the peace by presenting a new note early in Dec. 1853 to the two countries; but when he wished to insist upon Turkey's acceptance of these terms, Lord John Russell refused to support him. Rather than risk a break up of the cabinet, Aberdeen consented to a compromise of which advantage was taken by those who desired war; and Turkey was thus enabled to force England with her into the disastrous struggle. The stories of misery and mismanagement from the seat of war deprived the Government of public favour. Russell resigned; and in Jan. 1855, he was followed by Aberdeen, who interpreted a motion by J. A. Roebuck as one of no confidence. He died in London, on Dec. 14th, 1860, and was buried in the family vault at Stanmore. He left four children by his second wife, who died in Aug. 1833; the eldest son, George John James, succeeded as 5th earl; his youngest son, Arthur Hamilton, was created Baron Stanmore in 1893. Aberdeen wrote *An Inquiry into the Principles of Beauty in Grecian Architecture*, which was published in London, 1822. A bust of him by Matthew Noble is in Westminster Abbey, and his portrait was painted by Sir T. Lawrence.

See Sir T. Martin, *Life of the Prince Consort* (1875–80); A. W. Kinglake, *Invasion of the Crimea* (1877–88); Spencer Walpole, *History of England* (1878–86), C. C. F. Greville, *Memoirs*, edited by H. Reeve (1888); Spencer Walpole, *Life of Lord John Russell* (1889); Lord Stanmore, *The Earl of Aberdeen* (1893); J. Morley, *Life of Gladstone* (1903).

ABERDEEN, a royal burgh, city and county of a city, the capital of Aberdeenshire and chief seaport in the north of Scotland. Population (1931) 154,836. It is the fourth Scottish town in population, industry and wealth, and stands on a bay of the North Sea between the mouths of Don and Dee, 130½ m. N.E. of Edinburgh by the L.N.E.R. Though the residential suburb of Old Aberdeen, extending from the city suburbs to the southern banks of the Don, has a separate charter, history and privileges,

there is no distinction between it and New Aberdeen for parliamentary, municipal or other purposes. Aberdeen derives its popular name of the "Granite City" from its building stone, which under sunshine after rain gleams white and justifies the town's more poetical designation of the "Silver City by the Sea." The area of the city is 6,319 acres, the burghs of Old Aberdeen and Woodside, and the district of Torry (part of the north parliamentary division of the town) to the south of the Dee, having been incorporated in 1895. The city comprises 11 wards and 21 ecclesiastical parishes, and is under the jurisdiction of a council with lord provost, bailies, treasurer and dean of guild. The corporation owns the water supply (derived from the Dee at a spot 2rm. W.S.W. of the city), as well as lighting and tramways.

Streets and Buildings.—Roughly, the extended city runs north and south. From the new bridge of Don to the "auld brig" of Dee there is tramway communication via King street, Union street and Holburn road—a distance of over five miles. The name of the ancient castle of Aberdeen, long since demolished, is preserved in Castle street, Castlegate and Castlehill. From Castle street the imposing Union street 70 ft. wide runs west-south-west for nearly a mile, and contains the principal shops and most of the modern public buildings, all of granite. Part of the street crosses the Denburn ravine by a fine granite arch of 132ft. span; portions of the older town fringe the gorge, 50 ft. below the level of Union street. The Trinity Hall of the incorporated trades, originating between 1398 and 1527, and having charitable funds, contains some fine portraits attributed to George Jamesone, who was a native of Aberdeen and one of the earlier British portrait painters. Castle street continues Union street eastwards, and has the fine structures of the municipal and county buildings in Franco-Scottish Gothic (1867–78), the sheriff court house and the town hall, with excellent portraits; from the south-west corner a tower commands a fine view. At the upper end of Castle street stands the Salvation Army Citadel, one of the most imposing "barracks" possessed by this organization. In front of it is the beautiful Market Cross, one of the most notable of its kind in Scotland, an open-arched, hexagonal structure, 21ft. in diameter and 18ft. high, dating originally from 1682, when it replaced an earlier cross, and rebuilt on its present site in 1842. On an eminence east of Castle street are the military barracks, Aberdeen being the depot of supplies for the Gordon Highlanders. The fish market on the Albert Basin is an important centre of activity. The art gallery and museum is at Schoolhill, the MacDonald Hall containing portraits of contemporary artists by themselves being unique of its kind in Great Britain. In Sept. 1925 the city's war memorial was opened; it consists of a domed court, or hall of remembrance, attached to the art gallery and museum. Other extensions, enlarging the facilities of the art gallery and museum, opened at the same time include Cowdray Hall, used for lectures, with the Cowdray Museum of Applied Arts beneath it.

The see of Aberdeen is represented by the Old Cathedral of St. Machar, the only granite cathedral in the British Isles; the beginnings of the present structure date from the 14th century and were completed by Bishops Elphinstone (1484–1511) and Gavin Dunbar (1520). On the flat panelled ceiling are the heraldic shields of princes, noblemen and bishops who shared in its erection. The name of St. Machar (or Mochonna) is referred by tradition to a disciple of St. Columba who founded a chapel here for the conversion of the Picts. The bishopric, traditionally founded at Mortlach (Banffshire) by King Malcolm II. in 1010, in honour of a victory over the Danes, was transferred to Aberdeen by King David I. about the year 1137, a bull of Pope Adrian IV. dated 1157 "confirming all grants made by the kings of the Scots." "The church of Aberdeen" which is mentioned in the same bull, together with the church of St. Machar, is held to refer to the old church of St. Nicholas, of which there remains the Drum and Collison aisles which now link the east and west churches and an eastern crypt. The John Knox parish church was rebuilt in 1911; the Roman Catholic cathedral (Gothic, 1859) is in Huntly street. The episcopal cathedral of St. Andrews is the mother church of the Protestant Episcopal Church in the United

States.

The Dee is crossed by four bridges, including the railway bridge. Till 1832 the old bridge of Dee built by Bishops Elphinstone and Dunbar (and rebuilt in 1718–23 and 1842) formed the only entry to the city from the south. The bridge of Don, consisting of five granite arches, was built in 1827–32. The Auld Brig o' Balgownie, said to have been built by Robert the Bruce in the 13th century, and celebrated by Byron in the tenth canto of *Don Juan*, is one of the oldest historical bridges still in use. The parks and open

BY COURTESY OF LONDON, MIDLAND AND SCOTTISH RAILWAY
THE "AULD BRIG O' BALGOWNIE" AT ABERDEEN, SUPPOSEDLY BUILT BY ROBERT THE BRUCE (1274–1329), AND CELEBRATED IN BYRON'S POEM, "DON JUAN"

spaces include Duthie Park (45 acres), the gift of Miss Elizabeth Crombie Duthie of Ruthrieston; Victoria Park (13 acres) and its extension Westburn Park (13 acres); Stewart Park (11 acres), after Sir D. Stewart, lord provost in 1893; and Hazelhead Park. Capacious golf links and a bathing beach border the sea.

Education.—Aberdeen university consists of King's college in Old Aberdeen, founded by Bishop Elphinstone (q.v.) in 1494, and Marischal college, in Broad street, founded in 1593 by George Keith, 5th earl Marischal, the two colleges being incorporated together, 1860. In all 31 chairs, 3 readerships and 63 lectureships have been founded. Handsome new buildings have been erected, and an important addition to the resources of the university was the foundation, in 1913, of the Rowett Institute for Research in animal nutrition. Donations have been received for scholarships and bursaries, and the Carnegie Trust has made grants for the erection of buildings.

King's forms a quadrangle with interior court; the Crown Tower and the Chapel, the oldest parts, date from 1500. The choir of the chapel contains the original oak canopied stalls, miserere seats and lofty open screens in French flamboyant style. The principal at the time of the Reformation armed his folk to save the building from the barons of the Mearns (the modern Kincardineshire) after they had robbed St. Machar's of its bells and lead. The present building of Marischal college was erected in 1836–41 and has been greatly extended since. Dr. Charles Mitchell gave the great graduation hall and the Mitchell tower, opened in 1895, on the 400th anniversary of the university's foundation. A lintel stone from the old buildings of Marischal college is preserved at the foot of the Mitchell tower, bearing the famous inscription: THAY HAIF SAID • QUHAT SAY THAY • LAT THAME SAY, the circumstances giving rise to which are believed to embody the founder's retort to criticisms passed against him for his appropriation (by gift from the Crown) of lands and revenues belonging to the suppressed Cistercian abbey of Deer. A botanic garden was presented to the university in 1899.

Aberdeen, St. Andrews, Edinburgh and Glasgow universities combine to return three members to Parliament. The United Free Church college is in Tudor Gothic (1850). The Grammar school, reputedly first heard of in 1256, was removed in 1861–63 from Schoolhill to new buildings off Skene street. Robert Gordon founded (1729) and Alexander Simpson further endowed (1816) Gordon's Hospital for instruction and maintenance of sons of poor burgesses of gild and trade; since 1881 it is Robert Gordon's college for secondary and technical education.

Harbour.—A formerly defective harbour with a bar has been greatly deepened under various Acts since 1773. The north pier,

built partly by Smeaton in 1775-81, and partly by Telford in 1810-15, extends nearly 2,000ft. into the North sea. It increases the depth of water on the bar from a few feet to 32ft. at high water, and 19ft. at low water, spring tides. The wet Victoria dock of 29 acres, and with 6,000ft. of quay, was completed in 1848. Adjoining it is the Upper Dock. By the Harbour Act of 1868, 90 acres of new ground (in addition to 25 acres formerly made up) were provided on the north side of the Dee for the Albert Basin (with a graving dock), quays and warehouses. A breakwater of concrete, 1,050ft. long was constructed on the south side of the stream, and a third floating dock was built in 1911.

Industry.—Grey granite has been quarried for more than 300 years, and blocked and dressed paving "setts," kerb and building stones and monumental work have long been exported. Aberdeen is an important centre of the Scottish fisheries, the antiquity of which is shown by the mention of the provision of "dried fish from Aberdeen" in the royal wardrobe accounts of the 13th century. Other industries include jute, paper, agricultural materials, sail, rope and timber manufactures, engineering, chemical works, soap and candles, and distilling. In the days of wooden ships ship-building flourished, the town being noted for its fast clippers, many of which established records in the "tea races." The introduction of trawling revived this to some extent, and there is a fair yearly output of iron vessels.

History.—Aberdeen was important as far back as the 12th century. Corporate rights were granted by a royal charter of King William the Lion (1179), from whose times down to the 14th century the Scottish kings maintained a royal residence in Aberdeen. The city received other royal charters later. After it was burned by the English king, Edward III. in 1336, the new town which was built was called New Aberdeen to distinguish it from Old Aberdeen. The burgh records are the oldest in Scotland, being complete with one brief break from 1398 to the present day. During the struggles between the Royalists and the Covenanters the city was plundered by both. In the Scottish wars of independence led by William Wallace and Robert Bruce, Aberdeen gave its aid to both. The motto on the city arms of "Bon Accord" traditionally commemorates the watchword used by the Aberdonians aiding Robert Bruce. In 1715 the Earl Marischal proclaimed the Old Pretender at Aberdeen.

Once strongly fortified, the gates of the city were all removed by 1770. The importance of Aberdeen as a royal burgh and trading port placed it from the earliest times in the first rank of Scottish towns, a position which its great cathedral and, later, the fame of its university both served to maintain. Among the eminent men in a long line connected with Aberdeen, John of Fordun and John Barbour (*q.v.*) were both attached to the cathedral, while Hector Boece (*q.v.*) was the first principal of King's college; in modern times the Scottish historians, J. H. Burton and W. F. Skene were Aberdonians.

BIBLIOGRAPHY.—Among the earlier histories and descriptive accounts of Aberdeen are the works of W. Thom (1811), W. Kennedy (1818), R. Wilson (1822), J. Robertson (1839), and J. Gordon (Spalding Club, 1842); later works include G. Cadenhead (1876), A. Smith (1882), C. G. Burr and A. M. Munro (1886), W. Robbie, *Aberdeen: its Traditions and History* (1893) and E. H. B. Rodger, *Old Aberdeen* (1902). The Burgh charters and other records are published by the Spalding Club; also P. J. Anderson, *Charters*, etc. (1890) and A. M. Munro, *Records* (2 vols. 1900 and 1909). Other Spalding Club publications refer to the records of Marischal college (1889, 1898-99), the church of St. Nicholas (J. Cooper, 1888, 1892), and the *Registrum Episcopatus Aberdoniensis* (Cosmo Innes). The works of Prof. R. S. Rait (1895), J. M. Bulloch (1895) and F. A. Forbes, *The Founding of a Northern University* (1920) refer more specifically to the history of the two colleges. Mention may also be made of J. Bryce, *Eminent Men of Aberdeen* (1841); A. M. Munro, *Aldermen, Provosts and Lord Provosts of Aberdeen* (1897); and the descriptive handbooks by R. M. Walker and A. M. Munro (1906) and G. M. Fraser, *Historical Walks and Names* (Aberdeen, 1927).

ABERDEEN, a city of north-eastern Mississippi, U.S.A., at the head of navigation on the Tombigbee river; the county seat of Monroe county. It is south-east of Memphis, Tennessee (about 137 miles away). It is on Federal highway 45, and is served by the Frisco, the Illinois Central and the Mobile and

Ohio railways. The population in 1920 was 4,071 (52% negroes), and was 3,925 in 1930 by the Federal census. Formerly the cotton trade was the principal business. Aberdeen has a large trade in cotton, cotton seed and its products, cattle, feed, pelts, hides, wool, lumber, hardware and machinery. The dairy industry and truck-farming are developing rapidly. Two gas wells were "brought in" near by in 1927. The city was founded about 1834 and incorporated in 1837.

ABERDEEN, the second largest city of South Dakota, U.S.A., the county-seat of Brown county. It is in the north-eastern part of the State, on the Yellowstone Trail, about 270m. W. by N. of Minneapolis, and is served by nine lines altogether of the Chicago, Milwaukee and St. Paul, the Great Northern, the Chicago and North Western, and the Minneapolis and St. Louis railways. The population (90% native whites) was 4,087 in 1900 and 16,465 in 1930.

Aberdeen is the financial and trading centre of the northern part of the State, a fine agricultural region, producing grain, potatoes, hay and flax. In 1925 it had 35 manufacturing establishments, including packing houses, machine shops, and a flour-mill, which had an aggregate output valued at \$4,639,377. The Northern State Teachers college was established in 1901. An open-air theatre, with a seating capacity of 5,000, was added to the campus equipment in 1923. The college has an annual enrolment of about 2,000. It maintains a summer biological station at Lake Enemy Swim, near Waubay. Aberdeen was settled in 1880 and was chartered as a city in 1883.

ABERDEEN, a port of entry, the largest city of Grays Harbor county, Washington, U.S.A., on the north shore of Grays Harbor, about 50 m. W. of Olympia. It has an area of 10.5 sq.m.; is built on both sides of the Chehalis and the Wishkah rivers; and adjoins the city of Hoquiam (*q.v.*) on the west, and the town of Cosmopolis (population 1920, 1,512) on the east. The population of Aberdeen increased from 3,747 in 1900 to 15,337 in 1920, of whom 4,221 were foreign-born whites (nearly half Scandinavians) and it was 21,723 in 1930 by the Federal census. The three municipalities form one community, with a population (1927) of over 30,000; served by the Northern Pacific, the Union Pacific, and the Chicago, Milwaukee and St. Paul railways, by auto-stages to Puget sound, and by 39 steamship lines under seven flags.

Grays Harbor was discovered in 1792 by Capt. Robert Gray of Boston, on a trading voyage around the world. Aberdeen was founded in 1867 by Samuel Benn, who in 1873 established a cannery, and in 1883 planned the town site. It was incorporated in 1890.

ABERDEEN AND TEMAIR, JOHN CAMPBELL GORDON, 1ST MARQUESS OF, P.C., K.T., second son of the fifth earl of Aberdeen, was born in Edinburgh in 1847. He was educated at St. Andrews and University college, Oxford; he succeeded his brother as sixth earl of Aberdeen in 1870, taking his seat in the House of Lords early in 1873 and at once plunging into committee work. After being lord high commissioner to the general assembly of the Church of Scotland from 1881 to 1885—an office he again filled in 1915—Mr. Gladstone appointed him lord lieutenant of Ireland in his short administration (Feb.-July) of 1886. Soon after the Liberals' next accession to power he became governor general of Canada (1893) and after his return to England in 1898 took little part in politics. In Dec. 1905 he was again appointed lord lieutenant of Ireland; he held this office till May 1915, and in the following January received the title of Marquess of Aberdeen and Temair (Tara). Both in Canada and in Ireland Lord Aberdeen's terms of office were distinguished by the cordial relationship which he, as representative of his sovereign, maintained with the very different nations over whom he presided.

In 1877 Lord Aberdeen married the Hon. Ishbel Maria Majoribanks, a daughter of Lord Tweedmouth.

See *We Two: Reminiscences of Lord and Lady Aberdeen* (1925).

ABERDEENSHIRE, a north-eastern county of Scotland, bounded north and east by the North sea, south by Kincardine, Angus and Perth, and west by Inverness and Banff. It has a

coast-line of 65m., and is the sixth Scottish county in area, occupying 1,261,521ac. or 1,970 square miles. The county is generally hilly, since from the south-west, near the centre of Scotland, the Grampians send out various branches in a general north-easterly direction. The county is watered by the rivers Dee, Don, Ythan, Ugie and Deveron—names, especially the two first, associated with some of the finest valley scenery on the eastward slope of Scotland. The upper valley of the Dee, about Braemar, penetrates the central mass of crystalline schists belonging to the metamorphic rocks of the eastern highlands, with extensive intrusions of later granites, which, on the border with Banffshire, rise in the fine mass of Ben Macdhui (4,296ft.) to a height second only to that of Ben Nevis among the mountains of the British Isles. This mountain commands views of one of the most beautiful parts of the central highlands, with the summits of Braeriach (4,248ft.), Cairntoul (4,241ft.) and Cairngorm (Banffshire) near by, the columnar cliffs of Corrie Etchachan, and Loch Avon in its deep gully, 2,500ft. above sea-level. Among many other heights, "dark" Lochnagar, south-east of Braemar, is famed through a well-known song of Byron; and Benwachie, on the Banffshire border, through John Imlah's verse "O gin I were where Gadie rins." The shire is popularly divided into five districts. Of these the first is Mar, mostly between Dee and Don, the southern half of the county with the city of Aberdeen. The soil on the Dee is sandy, and on the Don loamy. The second district, Formartine, between the lower Don and Ythan, has a sandy coast, succeeded inland by a clayey, fertile, cultivated tract, and then by low hills, moors, mosses and tilled land. Buchan, the third district, lies north of the Ythan, and comprises the north-east part of the county. The surface is bare, low, flat or gently undulating and in places peaty. The coast is in parts bold and rocky, and at the Bullers of Buchan, 6m. south of Peterhead, the sea enters a basin by a natural arch and boils up violently in stormy weather. Buchan Ness is the most easterly point of Scotland. The fourth district, Garioch, in the centre of the shire, is beautiful, undulating, loamy and fertile. Strathbogie, the fifth district south of the Deveron, mostly consists of hills, moors and mosses.

Geology.—The schists extend east from the central mass to Formartine and Peterhead. East down Dee and Don and north across the plain of Buchan towards Rattray head and Fraserburgh there is a development of biotite gneiss, partly of sedimentary and perhaps partly of igneous origin. A belt of slate quarried for roofing purposes runs along the west border of the county from Turriff by Auchterless and the Foudland hills towards the Tap o'Noth near Gartly. The metamorphic rocks have been invaded in almost every part of the county by igneous materials, some before, and by far the larger series after the folding of the strata. There are chalybeate springs at Peterhead and Pananich near Ballater. The later granites subsequent to the plication of the schists have a wide distribution on the Ben Macdhui and Ben Avon range, and on Lochnagar; they stretch east from Ballater by Tarland to Aberdeen and north to Bennachie. Isolated masses appear at Peterhead and at Strichen. The Aberdeen granites have been widely used for building and paving, and extensively quarried at Rubislaw, Peterhead, Kemnay and elsewhere. The glacial deposits in the county indicate an eastward movement off the high ground at the head of Dee and Don, while the mass spreading outwards from the Moray Firth invaded the low plateau of Buchan; but at a certain stage there was a marked defection northwards parallel with the coast, as proved by the deposit of red clay north of Aberdeen. At a later date the local glaciers laid down materials on top of the red clay. The rivers abound with salmon and trout. Loch Muick, the largest of the few lakes in the county, 1,310ft. above the sea, $2\frac{1}{2}$ m. long and $\frac{1}{2}$ to $\frac{3}{4}$ m. broad, lies some $8\frac{1}{2}$ m. south-west of Ballater, and has Altnagiuthasach, a royal shooting-box, near its south-west end. Red deer (in Braemar), grouse, and partridges are plentiful.

The climate of the upper Dee and Don valleys has a reputation as the driest and most bracing in the British isles, and grain is cultivable up to 1,600ft. above sea-level—considerably higher

than elsewhere in the north of Great Britain. At Loch Muick vegetables, currants, laurels and roses flourish; the larch grows well, and elsewhere in Braemar natural timber, especially Scots fir in addition to larch, is particularly fine. Ash-trees, 5ft. in girth, are found at 1,300ft. elevation.

History.—The country now forming the shires of Aberdeen and Banff was originally peopled by northern Picts, whom Ptolemy called Taixali. Evidence of effective Roman occupation is lacking, though so-called Roman camps have been discovered on the upper Ythan and Deveron. Traces of the native inhabitants, however, are numerous. Weems or earth-houses are fairly common in the west. Relics of crannogs or lake-dwellings exist at Loch Ceander, or Kinnord, 5m. N.E. of Ballater, at Loch Goul in the parish of New Machar, and elsewhere. Duns or forts occur on hills at Dunecht, where the dun encloses an area of two acres, Barra near Old Meldrum, Tap o'Noth, Dunnideer near Inch and other places. Monoliths, standing stones and stone circles abound, and there are many early Christian sculptured stones. Efforts to convert the Picts were begun by Ternan in the 5th century and continued by Columba (who founded a monastery at Old Deer), Drostan, Maluog and Machar, but dissensions within the Columban Church and the expulsion of the clergy from Pictland by the Pictish king Nectan in the 8th century, undid most of the progress that had been made. The Vikings and Danes periodically raided the coast, but when (1040) Macbeth ascended the throne of Scotland the Northmen, under the guidance of Thorfinn, refrained from further trouble in the north-east. Macbeth was afterwards slain at Lumphanan (1057), a cairn on Perkhill marking the spot. Along with numerous Anglo-Saxon exiles after the Norman conquest of England there also came to Aberdeenshire Flemings who introduced various industries, Saxons who brought farming, and Scandinavians who taught nautical skill. The Celts revolted more than once, but Malcolm Canmore and his successors crushed them and confiscated their lands. In the 12th and 13th centuries some of the great Aberdeenshire families arose, including the earl of Mar (c. 1122), the Leslie, Freskins (ancestors of the dukes of Sutherland), Durwards, Bysets, Comyns and Cheynes, and in most cases their founders were immigrants. The Celtic thanes and their retainers slowly fused with the settlers. They declined to take advantage of the disturbed condition of the country during the wars of the Scots independence, and made common cause with the bulk of the nation. Though John Comyn (d. 1300?), one of the competitors for the throne, had considerable interests in the shire, his claim received locally little support. In 1296 Edward I. made a triumphal march to the north to terrorize the more turbulent nobles. Next year William Wallace surprised the English garrison in Aberdeen, but failed to capture the castle. In 1303 Edward again visited the county, halting at the castle of Kildrummy, then in the possession of Robert Bruce, and made Aberdeen his headquarters during several months. After Robert Bruce's death (1329) there was intermittent anarchy in the shire. Aberdeen itself was burned by the English in 1336, and the resettlement of the districts of Buchan and Strathbogie occasioned constant quarrels on the part of the dispossessed. Moreover, the Crown embroiled itself by trying to subdue some of the Highland chieftains. This policy culminated in the invasion of Aberdeenshire by Donald, lord of the Isles, who was, however, defeated at Harlaw, near Inverurie, by the earl of Mar in 1411. In the 15th century Sir Alexander Forbes was created Lord Forbes (c. 1442), and Sir Alexander Seton Lord Gordon in 1437 and earl of Huntly in 1445. Bitter feuds raged between these families but the Gordons' domains, already vast, were enhanced by the acquisition, through marriage, of the earldom of Sutherland (1514). Meanwhile commerce with the Low Countries, Poland and the Baltic had grown apace, Campvere, near Flushing in Holland, becoming the emporium of the Scottish traders, while education was fostered by the foundation of King's college at Aberdeen in 1494 (Marischal college followed a century later). At the Reformation so little intuition had the clergy of the drift of opinion that at the very time that religious structures were being despoiled in the south, the building

and decoration of churches went on in the shire. The change was acquiesced in without much tumult, though rioting took place in Aberdeen and St. Machar's cathedral in the city suffered damage. The 4th earl of Huntly offered some resistance, on behalf of the Catholics, to the influence of Lord James Stuart, afterwards the regent, Moray, but was defeated and killed at Corrichie on the Hill of Fare in 1562. As years passed it was apparent that Presbyterianism was less generally acceptable than episcopacy, of which system Aberdeenshire remained for generations the stronghold in Scotland. In 1638 the National Covenant was ordered to be subscribed, a demand so grudgingly responded to that the earl of Montrose visited the shire in the following year to enforce acceptance. The Cavaliers, not being disposed to

VIEW OF THE CENTRE OF ABERDEEN, SCOTLAND, SOMETIMES CALLED "THE GRANITE CITY," THE CHIEF CITY OF ABERDEENSHIRE

yield, dispersed an armed gathering of Covenanters in the affair called the Trot of Turriff (1639), in which the first blood of the Civil War was shed. The Covenanters obtained the upper hand in a few weeks, when Montrose appeared at the bridge of Dee and compelled the surrender of Aberdeen, which had no choice but to cast in its lot with the victors. Montrose, however, soon changed sides, and defeated the Covenanters under Lord Balfour of Burleigh (1644), and again after a stiff fight on July 2, 1645, at Alford. Peace was temporarily restored on the "engagement" of the Scots commissioners to assist Charles I. On his return from Holland in 1650 Charles II. was welcomed in Aberdeen, but in little more than a year General Monk entered the city at the head of the Cromwellian regiments. The English garrison remained till 1659, and next year the Restoration was effusively hailed, and prelacy was again in the ascendant. After the Revolution (1688) episcopacy passed under a cloud, and as George I. was antipathetic to the clergy, it happened that Jacobitism and episcopalianism came to be regarded in the shire as identical. The earl of Mar raised the standard of revolt in Braemar (Sept. 6, 1715); a fortnight later James was proclaimed at Aberdeen cross; the Pretender landed at Peterhead on Dec. 22, and in Feb. 1716 he was back again in France. The collapse of the first rising ruined many of the lairds, and when the second rebellion occurred 30 years afterwards the county in the main was apathetic, though the insurgents held Aberdeen for five months, and Lord Lewis Gordon won a trifling victory for Prince Charles Edward at Inverurie (Dec. 23, 1745).

Population and Government.—In 1911 the population numbered 312,177, and in 1931, 300,430 (158,462 females). In 1931, only 752 spoke Gaelic as well as English, and 19 persons Gaelic only; although as late as 1830 Gaelic was the common tongue almost throughout Braemar at least. The chief towns, with populations in 1931, are Aberdeen (154,836), Peterhead (12,545), Fraserburgh (9,720), Huntly (3,778), Inverurie (4,524), Turriff (2,298). The Supreme Court of Justiciary sits in Aberdeen to try cases from the counties of Aberdeen, Banff and Kincardine. The three counties are under a sheriff, and there are three sheriffs-substitute resident in Aberdeen, who sit

also at Fraserburgh, Huntly and Peterhead. The county, with Kincardineshire, sends three members to parliament. The county town, Aberdeen, returns two members.

Occupations.—Except in favoured tracts, as in Formartine and Garioch, the glacial drift soils are generally poor, gravelly or peaty; but in no part of Scotland has careful cultivation more successfully increased productivity. About two-thirds of the population depend on agriculture. Farms are small compared with those in the south-eastern counties. Oats are the predominant crop, wheat has practically gone out of cultivation, but turnips and barley are grown. Great numbers of the home-bred crosses of cattle are fattened for London and local markets, and Irish animals are imported on an extensive scale for the same purpose.

Fisheries.—The white and herring fishery is the next most important industry to agriculture, its development having been due almost exclusively to the introduction of steam trawlers. Aberdeen is the chief Scottish centre for trawling and great line fishing, and the chief port for white fish. Fraserburgh is one of the largest centres of the North sea herring fishing. Haddocks are salted and rock-dried (speldings) or smoked (finnans). The ports and creeks are divided between the fishery districts of Peterhead, Fraserburgh and Aberdeen, the last of which includes also three Kincardineshire ports. The herring season for Aberdeen, Peterhead and Fraserburgh is from June to September, at which time the ports are crowded with boats from other Scottish districts. There are valuable salmon-fishings—rod, net and stake-net—on Dee, Don, Ythan and Ugie.

Communications.—From the south Aberdeen city is approached by the L.M.S.R. (via Perth, Forfar and Stonehaven), and the L.N.E.R. (via Dundee, Montrose and Stonehaven). A line of the latter company runs via Kintore and Huntly to Keith and Elgin. Branch lines from Aberdeen to Ballater by Deeside, from Aberdeen to Fraserburgh (with a branch at Maud for Peterhead and at Ellon for Cruden bay and Boddam), from Kintore to Alford, and from Inverurie to Old Meldrum and also to Macduff. By sea there is regular communication with London, Leith, Newcastle and Hull, Inverness, Wick and other ports, the Orkneys and Shetlands, and the Continent. The highest macadamized road crossing the East Grampians rises to a point 2,200ft. above sea-level.

ABERDOUR, village and parish, Fifeshire, Scotland. Pop. (1931), 2,055. On the shore of the Firth of Forth, 17½m. N.W. of Edinburgh by the L.N.E.R., 7m. N.W. of Leith by steamer, it is a favoured bathing resort. There are ruins of a castle and a church with fine Norman work. About 3m. S.W. is Donibristle House, the seat of the earl of Murray (Moray). The island of Inchcolm, or Island of Columba, ¼m. from shore, is in the parish. The primitive stone-roofed oratory is supposed to have been a hermit's cell. Remains of 13th-century fresco have been found. Of an Augustinian monastery, founded (1123) by Alexander I., there remain a low square tower, church cloisters, refectory and small chapter-house.

ABERDOVEY (äb-ur-düv'ī) (ABERDYFI), a village on the north side of the Dyfi Estuary, Merionethshire, Wales. Population (1921) 1,466. Its site has associations in Welsh folk-lore with coastal submergence (see CARDIGANSHIRE). During the 17th, 18th and 19th centuries it had a considerable coasting and fishing trade, the export of slates from Corris and Aberllefeni being considerable. Aberdovey also exported lead ore from the mines of the Dyfi region. With the development of private motor traffic on a large scale since 1918 Aberdovey has become increasingly a resort for visitors from the large towns of England.

ABERFOYLE, village and parish, Perthshire, Scotland, 34½m. N. by W. of Glasgow by the L.N.E.R. Population of parish (1931) 1,014. The village is at the base of Craigmare (1,271ft. high) and on the Laggan, a headwater of the Forth. In 1885 the duke of Montrose built a road over the east shoulder of Craigmare to the Trossachs but this does not take motor traffic. The Laggan drains the small lochs Ard and Chon, the first of which is the scene of incidents in Scott's *Rob Roy*. There are slate quarries on Craigmare.

ABERGAVERN (ăb-ur-gĕn'f or ăb-ur-gă-vĕn'f), municipal borough, Monmouthshire, England, at the converge of roads from Crickhowell, Ross, Hereford, Newport and Merthyr, at the confluence of the Gavenny with the Usk. Population (1931) 8,608. There are evidences of the early occupation of the area on the hills around and the focus which became Abergavenny was the Roman Gobannium, a small fort guarding the road up the Usk. The town grew under the protection of the Norman lords of Abergavenny and there are remains of a castle built by Hamelyn de Baalun in the 11th century. The mediaeval walled town contained a Benedictine monastery which later became the church of St. Mary. Owing to its situation, the town was frequently embroiled in the border warfare of the 12th and 13th centuries and was burnt by Owain Glyndwr (Owen Glendower, *q.v.*) in 1404. At the dissolution of the priory part of its endowment went towards a free grammar school. In 1639 Abergavenny received a charter of incorporation with bailiff and burgesses. Like most towns of similar history it showed strong conservative tendencies during the Civil Wars when the town suffered badly at the hands of Fairfax (1646), and again in 1688 when it lost its charter for its strong Jacobean demonstrations. The market was important as early as 1200 and further reference is made to it in 1657, but with the better roads and greater movement of the 18th and 19th centuries cattle and horse fairs become more important. In the 18th and early 19th centuries Abergavenny prospered as a market and social centre. It was also famous for its Welsh flannel. Abergavenny was incorporated in 1899 and is governed by a mayor and corporation. It is in the parliamentary division of Monmouth.

ABERIGH-MACKAY, GEORGE ROBERT (1848-1881), Anglo-Indian writer, is known by his famous *Twenty-one Days in India* (1878-79), a satire upon Anglo-Indian society and ways of thinking.

ABERNETHY, JOHN (1680-1740), Irish Presbyterian divine, was born at Coleraine, county Londonderry, on Oct. 19 1680. He was educated at Glasgow, Edinburgh and Dublin, and was pastor of a church at Antrim for 14 years. In 1717 he was assigned by the synod to Usher's Quay, Dublin. He declined to obey, and remained at Antrim. This refusal became a test case of the authority of the ecclesiastical courts, and Irish Presbyterianism was split into two camps of "subscribers" and "non-subscribers." Out-and-out evangelical as John Abernethy was, there can be no question that he and his associates sowed the seeds of that after-struggle (1821-40) in which, under the leadership of Dr. Henry Cooke, the Arian and Socinian elements of the Irish Presbyterian Church were thrown out. In 1726 the "non-subscribers," in spite of pleading against separation by Abernethy, were cut off from the Irish Presbyterian Church. In 1730, although a "non-subscriber," he was invited to Wood Street, Dublin, whither he removed. In 1731 Abernethy made a stand against the Test Act, "against all laws that, upon account of mere differences of religious opinions and forms of worship, excluded men of integrity and ability from serving their country." He was nearly a century in advance of his age in his repudiation of tests and disabilities. He had to reason with those who denied that a Roman Catholic or Dissenter could be a "man of integrity and ability." His *Tracts*—afterwards collected—did fresh service, generations later, and his name is honoured by all who love freedom of conscience and opinion.

See Dr. Duchal's *Life*, prefixed to *Sermons* (1762); *Diary* in ms., 6 vols. 4to; Reid's *Presbyterian Church in Ireland*, iii. 234.

ABERNETHY, JOHN (1764-1831), British surgeon, was born in London on April 3 1764. He was apprenticed in 1779 to Sir Charles Blicke, then assistant surgeon to St. Bartholomew's Hospital, and studied under Sir William Buzard at the London Hospital and under John Hunter. When Blicke became surgeon to the hospital, Abernethy became assistant surgeon. He began to lecture to students in his house. The lectures were so crowded that the governors of the hospital decided to build a regular lecture theatre. Abernethy's best known work is *Surgical observations on the constitutional Origin and Treatment of Local Diseases* (1809). He had enjoyed great celebrity in private practice,

enhanced, it is said, by his rough manners. He was surgeon to the hospital 1815-27, and died at Enfield April 20 1831.

A collected edition of his works was published in 1830. A biography, *Memoirs of John Abernethy*, by George Macilwain, appeared in 1853.

ABERRATION IN OPTICAL SYSTEMS, the deviation of light rays from certain points through which they should pass in order to satisfy the conditions necessary for distinct focus. *Spherical* aberration results in distortion of the image, and *chromatic* aberration produces coloured fringes around an otherwise white image. (See OPTICS; PHOTOGRAPHY: *Apparatus*.)

ABERRATION OF LIGHT. This is an astronomical phenomenon depending on the fact that light is not propagated instantaneously. Our observations of the heavenly bodies are taken from the earth, a planet whose speed of motion is not incomparably smaller than that of the light; the result is that the apparent position of a star in the sky does not correspond to its true direction from the earth. We are accustomed to assume intuitively that a body is "where we see it to be"; or, since the distance cannot always be judged, that at any rate it is in the direction in which we see it. But actually vision gives only an indirect acquaintance with its position. That which affects our eyes is the light which has travelled to us from the object; we have, therefore, to take into consideration the circumstances of propagation of the light. It is well known that a light-ray changes direction in passing from one transparent medium to another, *e.g.*, water to air, and that its course is curved in a medium of varying density such as our atmosphere; an object seen by these dislocated or curved rays is displaced from its correct position, and the corresponding correction for *refraction* by the earth's atmosphere is highly important in determining the positions of stars. The correction for *aberration* is also concerned with the propagation of light; it arises from the fact that our actual judgment of the direction of a ray involves a combination of the earth's motion and the motion of the light.

The most elementary explanation can be given in terms of the old corpuscular theory of light—which was the theory accepted at the time aberration was discovered. If we think of the ray of light as a stream of missiles proceeding from the star with a speed of 186,000 m. a second, it is clear that the apparent direction from which the missiles come will be affected by our own velocity if that is not too insignificant in comparison. A common illustration is that of a man walking through a rain-storm with the drops falling vertically; the faster he walks, the more inclined is the position in which he must hold his umbrella to shield off the "missiles." The argument can be re-stated in terms of the wave theory of light without essential alteration; but reference should be made to an account of that theory for an explanation of the signification of "rays of light."

A rough way of aligning the direction of a star is to point a long narrow tube so that we can see the star through it. The alinement is given by the two apertures at the ends of the tube, which must be such that the small pencil of rays admitted through one can make an exit through the other and thus reach the observer's eye. The upper part of the diagram shows the rays of light coming from a star; the upper aperture E admits a narrow beam which continues in the original direction, so that F is the position in which the exit aperture has to be placed. Suppose that whilst the light travels the distance EF the earth moves through a distance GF; then the required direction of our tube is GE. It will then admit the light at E, and, by the time the light has travelled down the tube, the lower aperture will have reached the position F and the light will pass out. It will be seen that the tube GE does not point in the true direction of the star FE. The same principle applies when the tube is furnished with lenses, as in a telescope.

The alinement is the same whether the tube is long or short, and we can conveniently appreciate the relative proportions if we take EF to be 186,000 miles. The light then takes 1 second to pass from E to F; and in 1 second the earth travels in its orbit 18½ m., represented by GF. Thus GF is $\frac{1}{10,000}$ of EF. The greatest possible angle between the observed direction and the true direction is $\frac{1}{10,000}$ of a radian, or more accurately 20.47";

ABERRATION OF LIGHT

this is called the *constant of aberration*. For comparison the apparent radius of Jupiter is about $20''$; so that (when the aberration is a maximum) we see the centre of Jupiter when we are actually looking towards the edge of disc. As the direction of the earth's motion changes throughout the year so the direction of the aberration displacement of the star changes; the star is always displaced towards the "apex of the earth's way," i.e., the point of the sky towards which the earth's motion is directed. The star apparently moves in an ellipse around its true position as centre, making a circuit once a year. For a star at the pole of the ecliptic this ellipse is a circle of radius $20.47''$; for other parts of the sky the path may be regarded as a parallel circle which is projected into an ellipse by foreshortening. The major axis of the ellipse is always $20.47''$, but the minor axis depends on the latitude (i.e., distance from ecliptic) of the star.

Discovery of Aberration.—The discovery of the aberration of light in 1725, due to James Bradley (1693–1762) is one of the most important in the whole domain of astronomy; and in pure physics it has provoked a succession of investigations culminating in the theory of relativity. It was entirely unexpected, and it was only by extraordinary perseverance and perspicuity that Bradley was able to explain it in 1729. The discovery arose in the course of an attempt to discover whether the stars had appreciable parallaxes. We now know that stellar parallaxes are less than a second of arc, and the first authentic parallax was not measured until a century later. Many observers had, however, claimed to have discovered such parallaxes. In 1680 Jean Picard in his *Voyage d'Uraniborg* stated, as the result of ten years' observations, that the Pole Star exhibited variations of position amounting to $40''$ annually; some astronomers endeavoured to explain this by parallax, but the motion was at variance with that which parallax would occasion. J. Flamsteed, from measurements in 1689 and succeeding years with his mural quadrant, concluded that the declination of the Pole Star was $40''$ less in July than September. R. Hooke in 1674 concluded from his observations that γ Draconis was $23''$ more northerly in July than October.

When James Bradley and Samuel Molyneux entered this sphere of astronomical research in 1725 there was much uncertainty as to whether genuine stellar parallaxes had been detected or not; and it was with the intention of answering this question definitely that they erected a large telescope in the house of the latter at Kew. They determined to re-investigate γ Draconis, a star selected because it passed almost through the zenith in the latitude of London; its position would therefore not be affected by troublesome and uncertain corrections for refraction. The telescope constructed by George Graham (1675–1751), a celebrated instrument-maker, was affixed to a vertical chimney-stack; the eye-piece could be moved a little laterally so as to measure deviation from the vertical by means of a screw, the vertical being fixed by a plumb-line. The first observations were made on the 3rd, 5th, 11th, 12th Dec., 1725. On the 17th Bradley found the star to be moving southwards, and confirmed this on the 20th. (The change of position by aberration at this time of the year is rapid, and amounts to about $3.2''$ in ten days.) The star was found to continue its southerly course until March when it was about $20''$ south of the December position. By the middle of April it was apparent that it was returning north again. In September it reached its northerly limit, the extreme range between March and September being $40''$.

Although the observers were seeking an apparent shift of the star, they immediately realized that what they had found could not be attributed to parallax. The maximum range of parallactic shift for γ Draconis should be between June and December. Aberration and parallax are easily distinguished by this three months' difference of phase; the displacement of a star due to aberration is always at right angles to that due to parallax. Bradley and Molyneux discussed several hypotheses in the hope

of arriving at an explanation. One hypothesis was that the direction of the earth's axis and therefore of the plumb-line varied, causing an apparent displacement of the star when its position was measured with respect to the plumb-line. Observations were therefore made of another star on the opposite side of the pole; from a comparison of the displacements with those of γ Draconis it was found that they could not be explained by a shift of the earth's axis. The precaution, however, was fruitful; for by long continued observation Bradley ultimately established that shifts due to a change of the earth's axis actually occurred; and he was led to his second famous discovery—*nutation*. Bradley realized that observations of many more stars were required in order to determine the laws governing this mysterious effect. For this purpose he set up a more convenient telescope at the Rectory, Wanstead, the residence of the widow of his uncle, James Pound, who had guided him in his early astronomical work. This telescope, erected in Aug. 1727 had a range of $6\frac{1}{2}^\circ$ on each side of the zenith and thus covered a much larger area of the sky than the Kew instrument. Fifty stars were kept under close observation. Bradley disentangled from these observations the conclusion that a star had its extreme declinations at the times of the year when it passed through the zenith at 6 o'clock morning or evening.

The true theory of the phenomenon was discovered by an accident reminding us of the more apocryphal story of Newton and the apple-tree. Sailing on the Thames, Bradley noticed the shifting of the vane on the mast, as the boat altered her course; the shift was not due to unsteadiness of the wind, but to the combining of the changing motion of the boat with the steady velocity of the wind. This suggested that the changing direction of the ray from the star was the result of combining the changing motion of the earth with the steady velocity of the starlight. The finite velocity of light had been discovered by Roemer 60 years earlier.

Astronomical Effects.—In modern astronomy the aberration due to the earth's orbital motion is included along with precession and nutation as part of the "star correction" applied to reduce from Apparent to Mean Place. A small correction for diurnal aberration is also applied, arising from the motion of the observer caused by the diurnal rotation of the earth. For planets and comets a different procedure is adopted. It must be remembered that, even after allowing for the aberration, we see the body not where it is now but where it was when the light left it. Thus the corrected direction F E joins the position of the earth at the instant of observation to the position of the planet some minutes or hours before. Using the previous diagram but with a new connotation, let E be the planet when the light left it, and let F be the position of the earth when the light arrives. Whilst the light travels from E to F the earth travels from G to F, so that the *apparent direction* of the planet G E is the actual direction joining the positions of the earth and planet *at the time when the light left the planet*. Accordingly we do not trouble about the hybrid direction F E. We accept G E uncorrected; but we apply a correction to the time of observation, antedating it by the light-time. This simple procedure is inapplicable to the stars whose light-time is many years, because it assumes that the earth's velocity has been constant throughout the interval. But it answers a question often raised—whether we ought not to apply a correction on account of the aberration due to the motion of the whole solar system through space towards a point in Hercules. This motion, being uniform, admits of the above treatment; and the answer is that no correction is required provided that it is understood that the observation relates to the state of things when the light left the star; the aberration rather helpfully "puts back the sun" to the earlier date which must in any case pertain to the star.

Since the velocity of light is known with great accuracy the observed value of the constant of aberration determines the earth's orbital velocity. This can also be calculated when we know the radius of the earth's orbit from observations of the solar parallax. There has long been a rivalry between the constant of aberration and the solar parallax as to which shall provide the more accurate determination; at present the degree of

accuracy seems to be about equal, and the two methods are in satisfactory accord.

Aberration and Aether.—In the explanation of aberration we pictured the light as travelling in a straight line from the star uninfluenced by the motion of the earth carrying the observer. On the wave theory this would not be true if the aether in our neighbourhood were carried along with the earth; for when the light reaches this moving region of the aether its course will be disturbed, the motion of the aether (if the phrase has any literal meaning) being superposed on the ordinary velocity of the light traversing it. According to the modern idea of the atom, introduced by Rutherford in 1911, the electrons and atomic nuclei are so minute that the aether can slip through the void interior of the atom as easily as through the solar system, and there is no longer any reason to anticipate a convection; but in the last century it seemed almost contrary to reason to imagine solid matter pushing its way through the aetherial medium without serious disturbance. Apart from this prejudice, experimental evidence in the last century suggested that the aether in the lower part of our atmosphere was travelling with the earth, and further that moving matter such as a stream of water partially dragged the aether with it. Thus in 1818 Arago pointed out that the refraction by a prism (depending on the ratio of the velocities of light in air and glass) ought to be altered by the motion of the prism through the aether; since no such alteration was observed he concluded that the surrounding aether shared the motion of the prism. Fresnel explained this effect by a "dragging co-efficient," his hypothesis being that the "condensed" aether carrying the light inside the prism did not have the full motion of the prism but was only partially dragged in the same direction. This was apparently verified by Fizeau in 1851, who sent light in opposite directions round a circulating stream of water and thus studied its velocity with and against the current. In 1871 Airy performed his water-telescope experiment (originally suggested by Boscovitch) in which he measured the constant of aberration with a telescope that had its tube filled with water. Reasoning crudely, the aberration should have been increased, since the velocity of light in water is less than in air; but the normal value was obtained. Fresnel had already predicted that there would be a compensation when account was taken of the alteration of refraction at the surface of the moving liquid.

In the light of Fresnel's theory, it seemed to emerge from these results that the aether-drag was limited to the interior of the moving bodies, and that its effects were compensated by changes of refraction at the surface of the bodies, except when (as in Fizeau's experiment) differential motions were concerned. Thus the aether just outside the solid earth would be stagnant as the theory of aberration requires. But in 1887 Michelson and Morley made a much more delicate attempt to detect the difference of velocity of the earth and surrounding aether (*see RELATIVITY*); this seemed to decide that the aether was carried with the earth. Thus the conflict between stagnant and convected aether was brought to a head, the former being demanded by astronomical aberration and the latter by the Michelson-Morley experiment and certain later experiments involving similar principles.

The astronomical observations prove that the ray as it reaches the telescope is travelling in the same direction as when it started from the star; this, however, does not entirely rule out possible motions of the aether near the earth. It was shown by Sir George Stokes (1845) that the necessary and sufficient condition was that the motion should be of the kind known as "irrotational" in hydrodynamics. This would allow the kind of disturbance which might be anticipated from the earth's pushing its way through a fluid aether, since there is a well-known irrotational solution of the problem of a sphere moving through a liquid; but it does little to help the present difficulty since it involves a sliding of the aether over the surface of the sphere, which is precisely the point denied by the Michelson-Morley experiment. If the aether is allowed to be compressible (the density having, however, no effect on the velocity of light) an irrotational solution can be found which does not involve any slip of the aether at the earth's surface. This was pointed out by Planck, but the condensation

required is so extreme, that the loop-hole cannot be considered very seriously. The reconciliation was ultimately effected by the theoretical investigations of Lorentz and Larmor. Their work showed that the electrical structure of matter involves an alteration of length of all material objects in the direction of their velocity through the aether, which would compensate the effect looked for in the Michelson-Morley experiment—confirming a suggestion originally made by FitzGerald. When allowance is made for this contraction, none of the numerous experiments are capable of testing the relative motion of the earth and aether. The position about 1900-05 can be summed up as follows:—The earth moves through the stagnant aether without disturbing it, as the original explanation of astronomical aberration demands. The objection that bodies carried on the earth show no effects of this relative motion falls to the ground because it turns out that in all the experiments the effects are precisely compensated. For the further developments originating from these ideas reference should be made to the article *RELATIVITY*.

Astronomical aberration provides no means of determining a uniform motion through the aether; this will be apparent from what we have said as to the aberration from the motion of the solar system through space. But it provides a means of determining differences of velocity, such as the differences in the earth's orbital motion at different times of the year. Equally it can test any possible difference of aether-drift at different levels, *e.g.*, at the top and bottom of a mountain. Prof. D. C. Miller's recent attempt to test this by performing the Michelson-Morley experiment at the top of a mountain appears to us to have been misconceived; for even if (contrary to current theory) the experiment can reveal aether-drift, it is by no means comparable in accuracy with the test by astronomical observations, which assure us that the light of the stars is not deflected by any change of the aether current between a mountain observatory and the sea-level. All observable effects of aberration are due to relative velocity or change of velocity. On absolute velocity it is silent; and there is reason to believe that all other experiments are silent also—a conclusion which has led to the principle of relativity.

BIBLIOGRAPHY.—For Bradley's work *see* S. Rigaud, *Memoirs of Bradley* (1832) or H. H. Turner, *Astronomical Discovery* (1904). The practical application in astronomy is treated in all text-books on spherical astronomy. For the long controversy regarding stagnant and convected aether *see* J. Larmor, *Aether and Matter* (1900) and E. T. Whittaker, *A History of the Theory of Aether and Electricity* (1910). (A. S. E.)

ABERSYCHAN (äb-ur-züch'an), an urban district, Monmouthshire, England. The population in 1931 was 25,627. It lies in the narrow valley of Afon Lwyd between Pontypool and Blaenavon. Its situation on the iron field accounts for its early development, and when coal-mining became more important than iron smelting, Abersychan's prosperity increased, as the veins in the vicinity of the town produced some of the best steam coal in the country. The rapid growth of population has taxed all available building sites in the narrow valley bottoms and consequently the town has had to expand along the floor of the main valley and those of its small tributaries. Trade depression, unemployment and depopulation (since 1918) have affected Abersychan with the rest of the coal-field. Abersychan has stations on the Great Western Railway and London, Midland and Southern branch lines, connecting it with Newport and Brynmawr respectively. It is in the Pontypool parliamentary division.

ABERTILLERY, urban district, Monmouthshire, England, 16m. N.W. of Newport, on the G.W.R. Pop. (1891) 10,846; (1931) 31,799. It lies in the mountainous mining district of Monmouthshire and Glamorganshire, in the valley of the Ebbw Fach, and the large industrial population is mainly employed in the numerous coal-mines, iron-works and tinsplate works. The upper reaches of the valley were formerly important as iron smelting regions and coal was worked early at Abertillery. This region, like most of South Wales, has suffered badly in the trade depression following the World War.

ABERYSTWYTH (äb-ur-üst'with), watering-place and university town on the shores of Cardigan bay, Wales, at the mouth

of the artificially united Rheidol and Ystwyth rivers. Population (1931) 9,474 but in the summer months these figures are augmented by the presence of visitors. There appears to be a long tradition of settlement in the neighbourhood, for on a prominent hill (Pendinas) overlooking the south of the town is one of the largest hill-top earthworks in central Wales. With the clearing of the lowland, Pendinas was superseded by Llanbadarn Fawr, a village situated on a dry bend above the flood plain of the Rheidol about 1½ m. E. of the town. The existence of three Norman motte and bailey castles in the neighbourhood suggests loose military tenure in early Plantagenet times. The most interesting of these sites is Castell Aberystwyth situated above the bend of the Ystwyth about 1½ m. S. of the town. It gave its name to the Edwardian stone castle erected near the fishing village that grew up at the river mouths. The history of the castle was a troublesome one, as was to be expected from its position in the heart of Wales, but future developments centred in the little community that gathered beneath it, and not in Llanbadarn Fawr. Traces of the mediaeval town wall are still to be seen.

Aberystwyth shared in the mining (lead), agricultural and sea trade movements of the early 19th century and seems to have become at this time the social centre for the surrounding area. It has since extended northwards and eastwards over the newly drained marshy ground that surrounded the mediaeval settlement, and has gained favour as a summer health resort, especially since the development of the railway. The latter, however, killed the coastal trade and much of the seafaring habit (see CARDIGANSHIRE). In spite of this loss of old activities, Aberystwyth did not become a mere watering-place. As a link between the northern and southern parts of Welsh Wales, it became the site of the first University college of Wales, opened in 1872 and incorporated by charter in 1889, and of the National Library of Wales, opened in 1911. In 1906 the Welsh Calvinistic Methodist Theological college was moved here from Trevecca. Aberystwyth was a contributory parliamentary borough until 1885, when its representation was merged in that of the county.

ABETTI, ANTONIO (1846–1928), Italian astronomer, was born on June 19, 1846, at Gorizia, Italy. He was educated at Pisa. After working in the observatories at Pisa and Padua, Abetti became director of the Arcetri observatory, Florence, in 1894; he remained there until he retired in 1921. He made a special study of the minor planets and wrote a number of papers on this subject. Abetti was a member of the Academie dei Lincei; he died on Feb. 20, 1928.

Abetti wrote *Construction of a Sundial in a Vertical Plane* (1876); *Differences in Longitude between Rome, Padua and Arcetri* (1891), and *Annals of Arcetri Observatory* (1896–1911).

ABETTOR, a law term implying one who is present, actually or constructively, and aids and abets another to commit an offence. An abettor differs from an accessory (*q.v.*) in that he must be present at the commission of the crime; all abettors (with certain exceptions) are principals in the second degree, and, in the absence of specific statutory provision to the contrary, are punishable to the same extent as the actual perpetrator of the offence.

ABEYANCE, a state of expectancy in respect of property, titles or office, when the right to them is not vested in any ascertained one person, but awaits the appearance or determination of the true owner. In law, the term abeyance can only be applied to such future estates as have not yet vested or possibly may not vest. The freehold of a benefice, on the death of the incumbent, is said to be in abeyance until the next incumbent takes possession. A common use of the term is in the case of peerage dignities. If a peerage which passes to heirs-general, like the ancient baronies by writ, is held by a man whose heir-at-law is neither a male, nor a woman who is an only child, it goes into abeyance on his death between two or more sisters or their heirs, and is held by no one till the abeyance is terminated; if eventually only one person represents the claims of all the sisters, he or she can claim the termination of the abeyance as a matter of right. The Crown can also call the peerage out of abeyance at any moment, on petition, in favour of any

one of the sisters or their heirs between whom it is in abeyance. It is common, but incorrect, to speak of peerage dignities which are dormant (*i.e.*, unclaimed) as being in abeyance. (See **PEERAGE**.)

ABGAR, a name borne by a line of Mesopotamian kings, 29 in number, who reigned in Osroene and had their capital at Edessa in the last century before and the first century after the birth of Christ. According to an old tradition, one of these princes, perhaps Abgar V. (Ukkāmā or Uchomo, "the black"), being afflicted with leprosy, sent a letter to Jesus, acknowledging his divinity, craving his help and offering him an asylum in his own residence, but Jesus wrote a letter declining to go, promising, however, that after his ascension he would send one of his disciples. Eusebius states that in due course Judas, son of Thaddaeus, was sent (A.D. 29). The letters are given by Eusebius (*Eccl. Hist.* i. 13), who declares that the Syriac document from which he translates them had been preserved in the archives at Edessa from the time of Abgar.

This legend has survived in various forms, and has given rise to much discussion. The correspondence was rejected as apocryphal by Pope Gelasius and a Roman synod (c. 495), though, it is true, this view has not been shared universally by the Roman Church. Among Protestants the spuriousness of the letters is almost universally admitted. Lipsius (*Die Edessenische Abgarsage*, 1880) has pointed out anachronisms which seem to indicate that the story is quite unhistorical. The first king of Edessa of whom we have any trustworthy information is Abgar VIII. bar Ma'nu (A.D. 176–213). It is suggested that the legend arose from a desire to trace the Christianizing of his kingdom to an apostolic source.

See Lipsius, *Die Edessenische Abgarsage kritisch untersucht* (1880); Tixeront, *Les Origines de l'église d'Edesse et la légende d'A.* (1888); for the Epistles see **APOCRYPHAL LITERATURE**, sect. "New Testament."

ABGESANG: see **AUFGESANG**.

ABHIDHAMMA, the name of one of the three divisions into which the Buddhist scriptures are divided (see **BUDDHISM**). It consists in the Pali Canon of seven works: 1. *Dhamma-sangani* (enumeration of mental states). 2. *Vibhanga* (analysis). 3. *Kathā-vatthu* (subjects of discussion). 4. *Puggala-paññatti* (on classes of individuals). 5. *Dhātu-kathā* (on mental elements). 6. *Yamaka* (pairs of ethical states). 7. *Paṭṭhāna* (relations of ethical states). These have been published by the Pali Text Society, and the first, third, and fourth have been translated (see below). Most of the works consist of the analysis and classification of psychical states from an ethical standpoint, but the *Kathā-vatthu* gives a list of dogmas disputed between the eighteen sects. The Ceylon Chronicles say that it was spoken or promulgated (not composed) by Tissa Moggaliputta at the third council in 247 B.C. As Mrs. Rhys Davids has shown, it must have been compiled gradually. It is probably one of the latest of the works, but none of them are primitive, and some schools, according to Tāranātha, denied that Abhidhamma was the word of Buddha. The oldest name for this literature is *mātikā*, "lists," *i.e.* of the questions discussed, and it is mentioned under this name in several parts of the canon, but from this nothing can be inferred as to the age of the extant works. The Sarvāstivāda school had a similar set of seven works, which exist now only in a Chinese version. They have been analysed by Prof. Takakusu in the article mentioned below. The subject was first examined by Burnouf, who relied on the Mahāyāna canon as found in Tibetan, in which Abhidharma (Pāli, Abhidhamma) is represented by the *Prajñāpāramitā* and such works. These teach a doctrine of negativism, or as Prof. Stcherbatsky terms it, relativity, and hence Abhidharma was translated "metaphysics." But this is quite absent from the earlier schools, in which the term means "higher dharma."

See *Buddhist Psychology*, translation of *Dhamma-sangani*, and *Points of Controversy*, translation of *Kathā-vatthu*, by Mrs. Rhys Davids (1900 and 1915); E. Burnouf, *Introduction à l'histoire du bouddhisme indien* (1845); Tāranātha, *Geschichte des Buddhismus*, translated by A. Schiefner, St. Petersburg, 1869; "On the Abhidhamma books of the Sarvāstivādins," by Prof. Takakusu, in *Journal of the Pali Text Society*, 1905; *Designation of human types*, translation of *Puggala-paññatti*, by B. C. Law (1924). (E. J. T.)

ABHORRERS, the name given in 1679 to the persons who expressed their "abhorrence" at the action of those who had signed petitions urging King Charles II. to assemble parliament. To prevent the Exclusion Bill directed against James, the Roman Catholic Duke of York, from passing into law, Charles had dissolved parliament in July 1679, and in the following October had prorogued its successor without allowing it to meet. He was then deluged with petitions urging him to call it together; but Sir George Jeffreys (*q.v.*) and Francis Wythens presented addresses expressing "abhorrence" of the "Petitioners." Similar addresses reached the King from all parts of the country, and formed a counterblast to those of the Petitioners. See **WHIG** and **TORY**.

ABIATHAR, in the Old Testament, son of Ahimelech, priest of Nob. He alone escaped from the massacre carried out by Doeg. Fleeing to David, he remained with him throughout his wanderings and his reign. He was loyal through the rebellion of Absalom, but supported Adonijah against Solomon, and was banished to Anathoth. He probably represents an early rival house to that of Zadok, the official priestly family of Jerusalem down to the exile. (See especially I Sam. xxii. *seq.*, II Sam. xv. xx., I Ki. i. ii. iv.)

ABICH, OTTO WILHELM HERMANN VON (1806–1886), German mineralogist, geologist and traveller, was born in Berlin on Dec. 11, 1806, and died in Vienna on July 1, 1886. His earliest scientific work related to spinels and other minerals, and later he made special studies of fumaroles, of the mineral deposits around volcanic vents and of the structure of volcanoes. The mineral Abichite was named after him.

His works include: *Vues illustratives de quelques phénomènes géologiques, prises sur le Vésuve et l'Etna, pendant les années 1833 et 1834* (Berlin, 1836); *Ueber die Natur und den Zusammenhang der vulcanischen Bildungen* (Brunswick, 1841); *Geologische Forschungen in den Kaukasischen Ländern* (1878, 1882 and 1887).

ABIGAIL, one of David's earlier wives, formerly the wife of Nabal of Carmel in southern Judah. For the story of her relations with David, see I Sam. xxv. The use of the word in 16th and 17th century English is due to the fact that in I Sam. xxv. 25 Abigail calls herself a "handmaid."

ABIJAH, a name borne by nine different persons mentioned in the Old Testament, of whom the most noteworthy are (1) the son and successor of Rehoboam, king of Judah (*c.* 918–915 B.C.). The accounts of him in the books of Kings and Chronicles are very conflicting (*cf.* I Kings xv. 2 and II Chron. xi. 20 with II Chron. xiii. 2); (2) the second son of Samuel. He and his brother Joel judged at Beersheba, and their misconduct was made a pretext for demanding a king (I Sam. viii. 4).

ABILA, (1) generally called Abila of Pausanias to distinguish it from (2) below. It was the capital of the tetrarchy of Abilene in ancient Syria and an important town on the road between Damascus and Baalbek (Heliopolis). Ruins and inscriptions at modern village of Sūq Wādī Baradā mark its site which, though the names have no connection, is one of the traditional burial places of Abel. Early Arab geographers called it Ābil Al Sūq. According to Josephus, Abilene was a separate Iturean kingdom till A.D. 37, when Caligula granted it to Agrippa I.; in 52 Claudius granted it to Agrippa II. (See also **LYSANIAS**.) (2) A city of Perea (modern North Trans-Jordan) represented by ruins of Ābil Al Zait.

ABILDGAARD, NIKOLAJ ABRAHAM (1744–1809), Danish painter, was born at Copenhagen. He was known as the "Father of Danish Painting," had a great reputation in his own country, and was the master of Thorwaldsen and Eckersberg.

ABILENE, a city of Kansas, U.S.A., on the Smoky Hill river, about 95m. W. of Topeka; the county seat of Dickinson county. It is on Federal highway 40S, and is served by the Union Pacific, the Rock Island and the Santa Fé railways. The population was 3,507 in 1900, and 5,658 in 1930 Federal census. In the '60s Abilene, at the end of the trail from the south-west, was one of the important centres for shipping cattle. It has a large trade in cattle, grain and poultry, and is headquarters of the public utility companies serving central and western Kansas. Its creamery has an annual output valued at \$2,000,000. Flour-mills and bottling works for medicinal mineral water are also important. It is a

pleasant residential city, with well-designed public buildings. Abilene was settled about 1860; incorporated in 1869; and adopted the commission form of government in 1911.

ABILENE, a city of Texas, U.S.A., about 150m. W. by S. of Fort Worth, at an altitude of 1,800ft., almost at the geographical centre of the State; the county seat of Taylor county. It is on the Bankhead highway, and is served by the Texas and Pacific, the Abilene and Southern and the Wichita Valley railways, and by seven motor-stage lines. Between 1900 and 1920 the population increased threefold, from 3,411 to 10,274; and in 1930 was 23,175.

Abilene is the distributing centre for a fine farming and stock-raising district. Around it are many producing petroleum pools. It has 75 jobbing houses, and is headquarters for a score of oil companies. Natural gas is abundant. Cotton-seed and peanut products, poultry and stock feeds, poultry remedies, pressed brick and artificial limbs are manufactured. There are railway shops and two creameries. The assessed valuation of property in 1926 was \$20,565,865. The West Texas State fair is held here. Abilene is the seat of the West Texas Baptist hospital, which conducts a training-school for nurses; and of a State colony for epileptics. The city has a commission form of government. Its site was determined by the route of the Texas and Pacific railway. When it was extended through this region new towns sprang up as sections were completed, and at mile-post 407, on March 16, 1881, the first sale of building lots was held for the city of Abilene.

ABILITIES, GENERAL AND SPECIAL. The now common term "general ability" in its current signification is of recent origin. Previously it appears to have had only occasional usage in ordinary writing and conversation, being there taken to characterize excellence in performances of several different kinds; especially when these were not all readily subsumable under the name of "intelligence." As for the professedly psychological treatises, they took little notice of individual differences of ability at all, and when they referred to such they commonly did so in terms of the orthodox faculties, such as acuteness of sense, profundity of intellect, tenaciousness of memory, liveliness of imagination, and so forth.

But in the year 1904 the observation was made by C. Spearman that the correlations between different abilities tended to bear a special and regular relation to each other. They showed such comparative magnitudes that, when set out in the usual square table, they could be arranged in a "hierarchical" manner, so that the values proportionately diminished from left to right and from top to bottom. And from this hierarchy mathematical reasoning led to the theorem that the measure of any individual in any ability could be divided into two factors: the one was common to all the abilities concerned, whereas the other was specific to that ability alone. These two factors, "general ability" and "specific ability," were designated by the letters *g* and *s*. Further, the important corollary was drawn that, by averaging together many dissimilar mental performances, the influence of the *s*'s involved would—since they were mutually independent—tend to cancel out; in the long run the influence of *g*, being constant, would become paramount, or, in other words, the average would become an accurate measure of the pure "general ability" itself.

A year later, such a hotchpot of diversified mental performances was actually tried out, viz., by A. Binet, his purpose being to compare the mental powers of exceptionally dull children with those of normal ones. But he avoided using the theory by which such a hotchpot had been suggested; for this theory was incompatible with the doctrine of "faculties" which up to that time had been advocated by him and almost everybody else. Instead, he said that he was measuring what he called the child's "level of intelligence." This he expressed in terms of age. If a dull child of *x* years could pass the test-performances about as well on the whole as a normal child of *y* years, this *y* was taken to represent the "mental age" of the dull child; *x* minus *y* was called his "retardation."

The success of these tests of "intelligence"—constructed, as they were, with extreme ingenuity—proved to be quick and great. School teachers took them up not only for the dull chil-

dren but for all others, however bright. Each child had his "mental age" determined. So used and interpreted these tests found widespread favour. Other sets of tests were devised, and these proved to be no less successful, although possessing little, if anything, in common with the original set, except that they were miscellaneous.

The next landmark in the movement was a surprising exploit. Several different tests of "intelligence" were applied to the American army, that is to say, nearly two million men. The results were declared to be highly satisfactory by the secretary of State for war, himself. Even this application of the tests, unsurpassable in size as a single event, was soon overtopped by their cumulative further employment elsewhere. Putting together all the individuals tested in various countries—school children, university students, industrial employees, and others—the sum total could hardly have been less than some twenty millions. Still the results were usually reported to be very successful. Teachers and other persons using them declared that they derived valuable information from so doing.

Criticism.—Nevertheless, all was not quite so harmonious as it seemed. From the very beginning there had been an opposition party, and this continually waxed in strength. Many of the objections raised, indeed, were of but little importance. But one of them became increasingly obvious and menacing. It was that the testers did not really know what they were testing, nor even whether they were all testing one and the same thing. They were calling it "intelligence," but their usage of this term was highly equivocal. Few had troubled themselves to define what they meant, and those doing so had disclosed the most discrepant views. Equally discrepant, too, had been the test-making in actual practice. Consider, for instance—the objectors urged—that large part of mental activity which is commonly entitled memory. Some of the test-makers had brought this within the pale of what they were naming intelligence, whereas others had as carefully kept it all outside. Even the same psychologist would on one occasion construct his set of tests so as to involve much memory and even formal memorization, but on another occasion would reject any such thing. As for Binet himself, he began by declaring memory to be not intelligence but only a mimicry of this, and yet he straightway proceeded to make his tests depend on memory in a very high degree. Just as unfortunate had been the state of affairs with respect to the faculty of imagination, for this also was included by some testers within the purview of intelligence as conceived by them, whereas by others it was explicitly excluded. But the climax was reached when several declared that under intelligence must be comprehended even "sensation." Thus Binet himself wrote, "A sensation, a perception, are intellectual manifestations as much as reasoning is." Whereas other testers declared that if ever, from Plato onwards, there has been any one characteristic to form the very core—the *raison d'être*—of the concept of intelligence, it has been that of being something to be distinguished from and opposed to mere sensation. Small wonder, then, if the critics proceeded to assert, as J. Wallin did, that these widely-employed sets of tests of the so-called intelligence really "measure qualities which are so different as to be practically incommensurable."

There was a further and even graver objection raised against these measurements of intelligence or general ability, or whatever we like to call it. It demands evidence that any such mental power is susceptible of measurement at all. It points out that Binet had written as follows: "The mental faculties of each subject are independent and unequal; with a little memory there may be associated much judgment. . . . Our mental tests, always special in their scope, are each appropriate to the analysis of a single faculty." If thus, it is urged, the faculties are not one but many, how can one single measure possibly suffice? On such grounds, G. Whipple and S. Colvin had protested that a high total score in any such set of tests "fails to get anywhere in our real enquiry as to just which ones of the various mental functions are possessed by the extraordinarily-heightened efficiency. Is it memory span, or capacity for concentrated attention, or ability to handle symbols, or apprehension of abstract relations, or acute

perceptive capacity, or lively imagination, or originality, or breadth of associative tendencies, or speed of learning, or what, that demarcates such a child from other children?"

The inference from all this might seem to be that each of these faculties or functions ought to be measured separately. But thereupon just the same objections are raised over again, only on a smaller scale. For how, it is asked, can anyone measure memory in general when the individual may be excellently endowed with it for some classes of objects but very badly for others? As much may be said for all the rest of the faculties, "judgment," "imagination," "attention," etc. There would appear to be no rallying place along this line until we reach the last elements of knowledge and agree with the Herbartians that every idea has its own imagination, its own memory, its own judgment, and so forth. In like strain Thorndike wrote that "the mind is a host of highly-particularized and independent faculties."

Since the preceding objections seem to necessitate renouncing all claim that the tests measure general ability in the sense of anything that functions in a unitary manner, the natural step has been to take them as measuring some "average" or "sample" of many independent abilities. But here a crop of new difficulties has arisen. For it is objected that the operation of averaging, widespread and indispensable as it is both in psychology and elsewhere, still only becomes feasible when certain fundamental conditions are fulfilled. Certainly, any number of tests can be averaged. But can a person's abilities be so? One of the conditions evidently is that the domain should be settled within which the averaging is intended to run. No genuine averaging of a person's abilities can be effected until there has first been some agreement as to whether memory, imagination, sensation, motor skill, etc., are to be counted in or not. No such agreement, as we have seen, appears to have been reached, or even to be possible. Another needful condition in order to obtain any genuine average is to settle on some definite unit. In the case of abilities no such unit would seem to be ever discoverable. A further condition is that every unit should be given an equal weight, none being omitted and none counted more than once. This also cannot ever be satisfied by any set of tests, it would seem; by no method can they be so constructed that all the existing elements of ability are introduced and equally weighted. So much for averaging. If we turn to sampling, all the same difficulties recur, and indeed with some new ones added. For here again there is need of definite limits and definite units that are nowhere realizable. Again, there is the apparently hopeless task of giving to every unit an equal weight, in the sense that the sampling should be so carried out as to afford every possible cognitive element an equal chance of being introduced into the tests.

Such, then, are the formidable difficulties against which the vogue of testing general ability has run its head. By these—in spite of its vast dimensions and its claims of actual success—it has been compelled to pause and look around for some more secure foundation.

Re-interpretation.—All the time, however, that these obstacles were becoming more and more stubbornly resistant to the efforts at relying solely on practical success in testing, other investigators more theoretically inclined were busily discovering means whereby such obstacles could be safely surmounted. Indeed, the key to the solution had been supplied from the very beginning, namely, in taking general ability to be represented, not by any such psychological concept as "intelligence," but instead by the statistical concept of *g*. That the latter is measurable was definitely demonstrated. Since it recurs throughout all the cognitive powers of each individual, the general ability was unequivocally designated as that—whatever it might be—which was measured by this individual constant.

But to put this standpoint upon a secure foundation, much further research was indispensable. One branch of progress was purely mathematical. The criterion of the divisibility into the two factors *g* and *s* had to be established more rigorously than was done at first. What was much more difficult, means had to be devised for counteracting the disturbances of this criterion by the so-called errors of sampling. The other great branch of ad-

vance besides the mathematical one was by way of broadening the scope of observation. Originally, the relevant work had been limited to a single experimenter dealing with little over a hundred individuals, all of whom were young boys. But already in 1912 the range had been extended to 14 experimenters treating 1,463 boys and girls, men and women, sane and insane. At the present day this number of experimenters has certainly been quadrupled, whilst the number of individuals has been further multiplied at least twentyfold. All this progress, it must be added, has not been done without extensive and at times very acute controversy. This, however, has now mostly died down. The foregoing view is almost everywhere at any rate adopted in substance, if not always explicitly acknowledged.

So far we have only been considering the *main* theory, where the *g* is not credited with being anything more than a measured value which constantly recurs and therefore must have some constant basis in fact. By adopting this statistical standpoint, however, the psychological analysis is by no means rendered unnecessary; it is only, for convenience, postponed. Instead of having to be made prematurely in order to supply a definition to work with, it is accomplished gradually and provisionally in accordance with all such facts as may from time to time be elicited. The various psychological interpretations suggested for *g* constitute so many sub-theories of this. In respect of these, controversy not only still remains keen but probably will never be completely silenced. A fate may be expected for it analogous to that of the enquiry into the nature of electricity; for more than a century the latter has been susceptible of accurate measurement, and yet to this day expert opinion as to its real nature is always changing and developing.

At the present moment, the interpretation of *g* which has been found to account best for all the known facts is to conceive it as measuring some general psychic or psycho-physical "energy" responsible for all the activities of which the mind is capable. The *s*'s on this view become the various "engines" into any of which the energy may alternatively be directed, much as a current of electricity received from a single power station may at one moment be directed to the turning of a wheel, at another to the raising of a lift, and then, say, to the heating of a furnace. This interpretation can be symbolized in the following diagram. The whole area represents the cerebral cortex; the shaded patch is any special group of neurons; and the arrowheads stand for the lines of force from the entire cortex.

FROM SPEARMAN, "NATURE OF INTELLIGENCE AND THE PRINCIPLES OF COGNITION," BY COURTESY OF MACMILLAN & CO. LTD.

Among the most important of the engines has been found to be what is commonly called "mechanical aptitude," and what on psychological analysis is shown to consist of the power to educe spatial relations and correlates. Another engine (or system of engines) of cardinal importance is that which specifically subserves linguistic ability. Further vital engines are those connected with the several sensory and motor abilities. Of the many facts discovered concerning all these engines, perhaps the most interesting and significant is that they alone appear to be susceptible of improvement by practice; they alone, then, supply the material upon which education can work effectively. The amount of a person's "energy" would seem to be, under normal conditions, irrevocably fixed.

Still more important developments claimed for the theory of general and specific abilities have yet to be mentioned. For up to now we have only considered these in and by themselves. Whereas their investigation has led on to discovering some very important further mental characteristics. In addition to the *g* which measures the quantity of the energy of the mind, there has also been determined a value *p* which measures the degree of the "inertia" of this energy, and, furthermore, an *o* which measures the degree that the supply of the energy tends to oscillate. These three measures conjointly are said to furnish the chief features

distinguishing the abilities of one individual from those of another.

The evolution of the theory has gone further still, carrying it far beyond that whole sphere of psychology which appertains to individual differences. For during the time that the facts belonging to this sphere have been investigated with the success described, those belonging to "general" psychology have been treated from a fundamentally novel standpoint, that of the doctrine of "neogenesis." The unexpected result has been that these two spheres, hitherto kept by psychology in disastrous divorce from one another, would now seem to fit as hand and glove.

Finally, both these spheres of cognition—that of individual differences and that of general psychology—have in the continued development of the theory of *g* and *s* become organically united with that other great domain of the mind which is not cognitive but conative; it does not deal with knowing, but with desiring and striving. To the *g* and the *s*'s of the energy and the engines there has been added a *w* which brings all these into action, playing thus the part of the "engineer."

BIBLIOGRAPHY.—For a general account of the whole topic, see *The Abilities of Man* (1927), by C. Spearman, in which will also be found a comprehensive bibliography; also the work of A. Binet, *Année Psychologique* (1905); whilst the most notable contribution on the mathematical side has been that of Maxwell Garnett, *Brit. Journ. Psych.* (1920). Among other works which on no account should be overlooked are those of P. Ballard on the age at which *g* reaches its full growth, *Brit. Journ. Psych.* (1921); C. Burt on the development of reasoning power, *Journ. Educ. Psych.* (1923); W. Stern in his *Differential Psychology* (1911); L. Thorndike on *The Measurement of Intelligence* (1927); and of Webb on "Character and Intelligence," *Brit. Journ. Psych.*, Monthly Supplement (1915). (C. S.)

ABIMELECH, the name of two well-known characters in the Old Testament. (1) A king of Gerar in South Palestine with whom Isaac had relations. The patriarch, during his sojourn there, alleged that his wife Rebekah was his sister, but the king doubting this remonstrated with him and pointed out how easily adultery might have been unintentionally committed (Gen. xxvi.). Abimelech is called "king of the Philistines," but the title is clearly an anachronism. A very similar story is told of Abraham and Sarah (ch. xx.), but here Abimelech takes Sarah to wife, although he is warned by a divine vision before the crime is actually committed. The incident is fuller and shows a great advance in ideas of morality. Further incidents in Isaac's life at Gerar are narrated in Gen. xxvi. (cf. xxi. 22–34, time of Abraham), notably a covenant with Abimelech at Beer-sheba (whence the name is explained "well of the oath").

(2) A son of Jerubbaal or Gideon (*q.v.*), by his Shechemite concubine (Judges viii. 31, ix.). On the death of Gideon, Abimelech set himself to assert the authority which his father had earned, and through the influence of his mother's clan won over the citizens of Shechem. Furnished with money from the treasury of the temple of Baal-berith, he hired a band of followers and slew 70 (cf. 2 Kings x. 7) of his brethren at Ophrah, his father's home. Abimelech thus became king, and extended his authority over central Palestine. But his success was short-lived, and the subsequent discord between Abimelech and the Shechemites was regarded as a just reward for his atrocious massacre.

ABINGDON, municipal borough, Berkshire, lying in the flat Thames valley on the Oxford border, where the small river Ock, draining the Vale of White Horse, joins the Thames. Pop. (1931) 7,240. Abingdon (Abbedun, Abendun) was famous for its abbey, which was of great wealth and importance, and is believed to have been founded in A.D. 675 by Cissa, one of the *subreguli* of Centwin. Abundant charters from early Saxon monarchs are extant confirming various laws and privileges to the abbey, and the earliest of these, from King Ceadwalla, was granted before A.D. 688. In the reign of Alfred the abbey was destroyed by the Danes, but it was restored by Edred, and an imposing list of possessions in the Domesday survey evidences recovered prosperity. William the Conqueror in 1084 celebrated Easter at Abingdon, and left his son, afterwards Henry I., to be educated at the abbey. After the dissolution in 1538 the town sank into decay, and in 1555, on a representation of its pitiable condition, Queen Mary granted a charter establishing it as a free borough corporate with a common council. The council was

empowered to elect one burgess to parliament, and this right continued until the Redistribution of Seats Act of 1885. The abbot seems to have held a market from very early times, and charters for the holding of markets and fairs were granted by various sovereigns from Edward I. to George II. In the 13th and 14th centuries Abingdon was a flourishing agricultural centre with an extensive trade in wool, and a famous weaving and clothing manufacture. The latter industry declined before the reign of Queen Mary, but has since been revived.

Remains of the Benedictine Abbey include a beautiful Perpendicular gateway, ruins of buildings called the prior's house, and the guest house. The narrow arched bridge over the Thames dates from 1416, and was doubtless an important feature in the town's growth. Near the bridge is St. Helen's church, the fine Early English tower and Perpendicular spire of which are the principal objects in the views of the town from the river. There may be mentioned further the old buildings of the grammar school, founded in 1563, and of the charity called Christ's Hospital (1583); while the town hall in the market-place is attributed to Inigo Jones.

Abingdon has manufactures of clothing and carpets and a large agricultural trade. The borough is under a mayor, four aldermen and 12 councillors. Area, 730 acres. For purposes of parliamentary representation it is included in the Abingdon county division.

ABINGER, JAMES SCARLETT, 1st BARON (1769–1844), English judge, was born on Dec. 13, 1769 in Jamaica, where his father, Robert Scarlett, had property. He was educated at Trinity college, Cambridge, and the Inner Temple. From 1816 when he became a K.C., to 1834 he was the most successful lawyer at the bar. He entered parliament in 1819 as member for Peterborough and was attorney-general under Canning in 1827; and though he resigned when the Duke of Wellington came into power in 1828, he resumed office in 1829 and went out with the Duke of Wellington in 1830. His opposition to the Reform bill caused his severance from the Whig leaders. He was appointed lord chief baron of the exchequer in 1834, and presided in that court for nine years. He died at Bury St. Edmunds on April 7, 1844. The qualities which brought him success at the bar were not equally in place on the bench; he was partial, dictatorial and vain; and complaint was made of his domineering attitude towards juries.

See P. C. Scarlett *Memoir of James, 1st Lord Abinger* (1877); Foss, *Lives of the Judges*; E. Manson, *Builders of our Law* (1904).

ABINGTON, FRANCES (1737–1815), English actress, was the daughter of a private soldier named Barton, and was, at first, a flower girl and a street singer. She appeared at the Haymarket in 1755 as Miranda in Mrs. Centlivre's *Busyboddy*. In 1756, on the recommendation of Samuel Foote, she joined the Drury Lane company. In 1759, after an unhappy marriage with her music-master, one of the royal trumpeters, she is mentioned in the bills as Mrs. Abington.

Her first remarkable success was in Ireland as Lady Townley, and it was only after five years, on the pressing invitation of Garrick, that she returned to Drury Lane. There she remained for 18 years, and created more than 30 important characters, notably Lady Teazle (1777). Her Beatrice, Portia, Desdemona and Ophelia were no less liked than her Miss Hoyden, Biddy Tipkin, Lucy Lockit and Miss Prue. It was in the last character in *Love for Love* that Reynolds painted his best portrait of her.

In 1782 she left Drury Lane for Covent Garden, where she played until 1790. She reappeared on the stage for two years (1797–99), and then retired. Her ambition, wit and cleverness, won for her a position in society. She died March 4, 1815.

ABINGTON, a town of Plymouth county, Mass., U.S.A., 19m. S. by E. of Boston. It is served by the New York, New Haven and Hartford railroad, and by trolley and bus lines. The population was 5,872 in 1930 Federal census. Farming, fruit growing (especially strawberries), and dairying are carried on. The principal manufactures are boots and shoes, lasts, cement blocks, window-shades and machinery. The town was settled about 1680 and incorporated in 1712.

ABIOGENESIS, in biology, the term, equivalent to the older terms "spontaneous generation," *Generatio aequivoca*, *Generatio primaria*, and more recent terms such as archeogenesis and archebiosis, for the theory according to which fully formed living organisms sometimes arise from non-living matter. Aristotle explicitly taught abiogenesis, and laid it down as an observed fact that some animals spring from putrid matter, that plant-lice arise from the dew falling on plants, etc., and most of the earlier biologists accepted his views. The first step in the scientific refutation of the theory of abiogenesis was taken by the Italian Redi, who, in 1668, proved that no maggots were "bred" in meat on which flies were prevented by wire screens from laying their eggs. From the 17th century onwards it was gradually shown that, at least in the case of all the higher and readily visible organisms, abiogenesis did not occur, but that *omne vivum e vivo*, every living thing came from a pre-existing living thing.

The discovery of the microscope carried the refutation further. In 1683 A. van Leeuwenhoek discovered bacteria, and it was soon found that however carefully organic matter might be protected by screens, or by being placed in stoppered receptacles, putrefaction set in, and was invariably accompanied by the appearance of myriads of bacteria and other low organisms. As knowledge of microscopic forms of life increased, so the apparent possibilities of abiogenesis increased, and it became a tempting hypothesis that whilst the higher forms of life arose only by generation from their kind, there was a perpetual abiogenetic fount by which the first steps in the evolution of living organisms continued to arise, under suitable conditions, from inorganic matter. It was due chiefly to L. Pasteur that the occurrence of abiogenesis in the microscopic world was disproved. If organic matter were first sterilized and then prevented from contamination from without, putrefaction did not occur, and the matter remained free from microbes. The nature of sterilization, and the difficulties in securing it, as well as the extreme delicacy of the manipulations necessary, made it possible for a very long time to be doubtful as to the application of the phrase *omne vivum e vivo* to the microscopic world, and there still remain a few belated supporters of abiogenesis. It may now be stated definitely that all known living organisms arise only from pre-existing living organisms. It must be noted, however, that this statement relates only to known existing organisms. It may be that in the progress of science it may yet become possible to construct living protoplasm from non-living material. The refutation of abiogenesis has no further bearing on this possibility than to make it probable that if protoplasm ultimately be formed in the laboratory, it will be by a series of stages, the earlier steps being the formation of some substance, or substances, now unknown, which are not protoplasm. Such intermediate stages may have existed in the past, and the modern refutation of abiogenesis has no application to the possibility of these having been formed from inorganic matters at some past time. Perhaps the words archebiosis, or archeogenesis, should be reserved for the theory that protoplasm in the remote past has developed from non-living matter by a series of steps, and many of those, notably T. H. Huxley, who took a large share in the process of refuting contemporary abiogenesis, have stated their belief in a primordial archebiosis. (See BIOGENESIS and LIFE.)

ABIPONES, a tribe of South American Indians belonging to the Guaycuruan (*q.v.*) linguistic stock. The Abipones were a warlike, nomad hunting people, living in the Argentine Chaco, between the Vermejo and Salado rivers. Although once numerous, they are now believed to be quite extinct. Both men and women wore mantles of coarse textiles, belted at the waist; the women were abundantly tattooed, the men but slightly. The latter wore long, pendant labrets. Their dwellings were tents of mats. Spears, bows, clubs, slings and bolas were their weapons. They had no shield, but used a poncho of heavy hide for protection. They made no use of canoes, having only "bull-boats" of hide stretched over a bowl-shaped frame, for crossing broad streams. Pottery was made. The people were divided into local social units, over which a semi-hereditary chief presided, although he had little power. The bodies of the dead were buried, unless death occurred far from home, when the flesh was stripped from the bones, and

these placed in a leather sack. This was carried with the roving group, until they reached their home, where it was buried. The property and tent of the deceased were burned. Little is known of their religious beliefs and ceremonial. They possessed, however, some sort of secret societies, membership in which was attained by valour, and which celebrated ceremonials of importance.

The Abipones became widely known from the account of them written by the missionary Dobrizhoffer, at the end of the 18th century, after they had become horse Indians.

See M. Dobrizhoffer, *An Account of the Abipones*, etc. (1822).

ABITIBBI, lake and river, Ontario, Canada. The lake, 49° N. 80° W., 60m. long, is shallow and studded with islands; the shores are covered with small timber. The Hudson's Bay Co. used it on a canoe route to the northern fur lands. The Grand Trunk Pacific (now the Canadian National) Railway passes through this district. Its outlet is the rapid Abitibbi river, which after 200m. joins the Moose river.

ABJURATION, a solemn repudiation or renunciation on oath. At common law, it signified the oath of a person who had taken sanctuary to leave the realm for ever; this was abolished in the reign of James I. The *Oath of Abjuration*, in English history, was a solemn disclaimer, taken by members of parliament, clergy and laymen against the right of the Stuarts to the Crown, imposed by laws of William III., George I. and George III.; but its place has since been taken by the Oath of Allegiance.

ABKHASIA, a Socialist Soviet Republic under the protection of the Georgian S.S.R. (*q.v.*), comprising six districts of the former Sukhum province. Area 8,172sq.km. Pop. (1926) 199,175; urban 30,617, rural 168,558. Its boundaries are, on the north, the north Caucasian area and Karachayev autonomous area, on the south and east, the Georgian S.S.R., on the west, the Black sea. It is divided into the following districts for administrative purposes, 1926 population given in parentheses. Gagrinsk (9,950; urban 3,659, rural 6,291), Galsk (50,071; entirely rural), Gydait'sk (30,740; urban 3,536, rural 27,204), Kodorsk (33,043; urban 3,390, rural 29,653) and Sukhum (75,371; urban 20,032, rural 55,339). The area is mainly mountainous and densely forested (especially oak and walnut). The Black sea coastal belt from Sukhum-Kaleh southwards is an evergreen vegetation area, with citrus fruits (oranges, mandarins, lemons), camellias and even palms. It has hot, sunny summers and winter rains of the western coast Mediterranean type, but in winter low pressure systems form on the Black sea, with south and south-east winds bringing rain. Average temperature at Sukhum-Kaleh is in January 48°-8 F., August 76°-1 F. Oranges ripen in December and spring begins in February. The area is never frozen, and snow rarely falls and never lies; malaria is a perpetual scourge. The chief products are tobacco and maize, with wheat, grapes, figs, pomegranates, citrus fruits and wine (vines hang from walnut trees). Tea and mulberries (for silk) are produced. On higher land, cattle and horses are bred and bees kept. The chief town is Sukhum-Kaleh on the Black sea coast (site of ancient Greek Dioskurias). Pop. (1926) 17,426. The town is noted for manufacture of saddlery. Other coastal towns are Pitsunda and Ochamchiri. A coastal railway is being constructed. There are extensive coal deposits, practically unworked at present.

Abkhazia became Christian under Justinian (*c.* 550), later Mohammedan (after its conquest by the Turks in the 15th century) and definitely Russian after 1864. It includes part of the former Mingrelia, the Colchis of antiquity. The people are of Circassian stock, related to Cherkesses and Kabardians, and speaking, like them, a distinct non-Aryan dialect; there are apparently both tall and fair groups, and short, dark groups, with Tatar intermixture. In the Kodor district small groups of negroes have settled and intermarried.

ABLATION, the process of removing anything; a term used technically in geology of the wearing away of a rock or glacier by weathering agents, and in surgery for operative removal.

ABLATIVE, in grammar, a case of the noun, the fundamental sense of which is direction from; in Latin extended to the instrument or agent of an act, and the place or time at, and manner in, which a thing is done; also found in Sanskrit, Zend,

Oscan, Umbrian and other languages. (Lat. *ablativus*, *sc. casus*, from *ablatus*, taken away.) The "ablative absolute," in Latin, consists of a noun in the ablative case, with a participle or qualifying word agreeing with it, not depending on any other part of the sentence, to express the time, occasion or circumstance of a fact.

ABLUTION, a ritual washing destined to secure that ceremonial purity which must not be confused with the physical cleanliness obtained by the use of soap and water. (Lat. *ablutio*, from *abluere*, "to wash off.") Indeed the two states may conflict, as with the 4th century pilgrim who boasted that she had not washed her face for 18 years for fear of removing the baptismal chrism. In the Catholic Church the *ablution* is the ritual washing of the chalice and of the priest's fingers after celebrating mass; or the wine and water used for this purpose. The purport of ablutions is to remove the supposed stains contracted by contact with the dead, with childbirth, menstuous women, murder, almost any form of bloodshed, persons of inferior caste, dead animal refuse, leprosy, madness and disease. In general, water, cows' urine and blood of swine are the materials used in ablutions. Of these water is the commonest, and its efficacy is enhanced if it be running, and still more if a magical or sacramental virtue has been imparted to it by ritual blessing or consecration. In the *Atharva-Veda*, vii. 116, a remedy for fever is to tie to the foot of the bed a frog, bound with red and black thread, and wash down the patient so that the water of ablution falls on the frog, the magician praying that the fever may pass into the frog, which is forthwith released. In the old Athenian Anthesteria the blood of victims was poured over the unclean. A bath of bulls' blood was used as a baptism in the mysteries of Attis. The water must in ritual washings run off in order to carry away the miasma or unseen demon of disease; so the early Christians used living or running water, which the baptizer must pour over the head of the baptized person so that it runs down his body. Similarly the Brahman takes care to wipe the cathartic water off from head to feet downwards, that the malign influence may pass out through the feet. The same care is shown in ritual ablutions in the Bukovina and elsewhere.

Water, fire, spices and sulphur are used in ritual cleansings (Iamblichus on Mysteries, v. 23), as being specially full of the divine nature. But in all religions the cathartic virtue of water is enhanced by means of suitable prayers and incantations. Ablutions are usually cathartic, that is, intended to purge away evil influences (*καθαλύνειν*, to make *καθαρός*, pure). But things and persons may become taboo, that is, so holy as to be dangerous and useless for daily life, through the mere infection of holiness. Thus in Syria one who touched a dove became taboo for one whole day, and if a drop of blood of the Hebrew sin-offering fell on a garment it had to be ritually washed off. It was as necessary for the Hebrew priest to wash his hands *after* handling the sacred volume as before. Christians might not enter a church to pray without first washing their hands. Tertullian (*c.* 200) condemned this as a heathen custom; but it was insisted on in later ages (Sozomen, vi. 6) and is a survival of the pagan lustrations or *περιπαρήρεια*. The same custom prevails among Mohammedans. Porphyry (*de Abst.* ii. 44) relates that one who touched a sacrifice meant to avert divine anger must bathe and wash his clothes in running water before returning to his city and home, and similar scruples in regard to holy objects and persons have been observed among the natives of Polynesia, New Zealand and ancient Egypt.

ABNAKI, a group of closely related and confederate Algonkin Indian tribes originally centring in Maine, now mainly in Quebec and New Brunswick. The name means "east land." They included the Etchimin, Malecite, Passamaquoddy and Penobscot, often reckoned as distinct tribes. They fought the English colo-

nists, were friendly with the French, and in the 18th century most of the bands withdrew to French Canadian soil. They grew maize, hunted and fished, lived in conical houses of bark or mats, palisaded their villages, were divided into patrilineal totemic clans, and were typical northern woodland tribes. Their speech is close to the Algonkin dialects of the Great Lakes. About 2,000 survive.

ABNER. In the Old Testament, Saul's cousin and commander-in-chief, comes into prominence only after the crushing defeat of Israel at Mt. Gilboa. This battle placed the Philistines in control of the whole of central Palestine, and the weakness of Israel was enhanced by the division into two parties, that of the south, which followed David, and that of Transjordan, which remained faithful to Ishbaal, the son who succeeded Saul. The king himself, however, was a weak character, and the whole strength of the party was concentrated in Abner. The struggle between the two parties was continuous, and in the battle of Gibeon Abner killed Asahel, brother of Joab, thus exposing himself to the blood-vengeance of the dead man's whole family. It seems that Abner aspired to become the sole leader of his party, and, as a step in the achievement of his aim, married Rizpah, one of the concubines of Saul. For this he was reproved by Ishbaal, and thereupon deserted to the opposite party. An agreement was made between David and Abner, by which David had restored to him Michal, daughter of Saul, thus establishing a claim on Saul's throne, and Abner was received into favour. Joab, however, in obedience to the binding law of blood-revenge, took an opportunity of putting Abner to death, and his disappearance practically brought to an end the resistance of the eastern party. David, of course, was not implicated in Abner's death, though he had no right to punish the assassin, and his short dirge over the body, like that over Saul and Jonathan, is an exquisite specimen of the early poetry of Israel. (See II. Sam. ii. 8; iii. 39.)

ABNEY, SIR WILLIAM DE WIVELESIE (1843-1920), English chemist, was born at Derby July 24 1843 and died at Folkestone on Dec. 3 1920. Abney held high appointments at the board of education and was president at different times of the Royal Astronomical Society and the Physical Society. His contribution to science was mainly in the furtherance of photographic chemistry and especially of colour photography and colour printing. His publications on these subjects include *Instruction in Photography* (1870); *Colour Vision, Colour Measurement and Mixture* (1893); and *Trichromatic Theory of Colour* (1914). He also wrote *Thebes and its Five Great Temples* (1876), and, with C. D. Cunningham, *The Pioneers of the Alps* (1888).

ABNORMALITIES AND DEFORMITIES: see MONSTERS.

ABNORMAL PSYCHOLOGY. By abnormal psychology is meant the study of mental processes that deviate from an imagined norm. When the deviation is unmistakable the term "psychopathology" is more commonly employed. Otherwise the terms "medical psychology" or "clinical psychology" are the usual ones, "abnormal psychology" being used only by one psychopathologist of note—Morton Prince. The term "clinical psychology" connotes a special approach and attitude towards the problems concerned, one identical with that indicated by the word "clinical" in medicine, namely, that the problem is envisaged as related to the whole of a living organism and not isolated as is often done in academic psychology. It is essential to realize from the outset that this subject is not, as might have been expected, simply the extension of the psychology of the normal to the study of the abnormal. For reasons that will become apparent later, what should have been the applied branch has had to create its own discipline, its own methods and its own general outlook. The case, indeed, has been reversed, for it is becoming plainer that it is only by means of studying the phenomena which for the sake of convenience we call "abnormal"—though they do not possess the attributes commonly associated with this word—that the deeper problems of the mind are at all possible of approach. This holds good for the so-called "normal" as for the so-called "abnormal," so that it is by no means impossible that the uncertainty in nomenclature just alluded to may ultimately be solved by our simply adopting the word "psychology" for the whole field.

The branch of science here considered has been almost entirely the construction of the past 40 or 50 years. In this time a huge mass of knowledge, little known outside the specialist field, has accumulated. Much of it has been of an unexpected and, indeed, revolutionary nature which requires considerable assimilation to the generally existing outlook on life and particularly to man's previous view of himself. The difficulties encountered in the earlier advances of science, repeated time and again in the past 400 years, here reach their maximum. They are both external, in the form of intense opposition to the unwelcome new, and internal, in the form of the subjectivity which is the bane of all science. The presence of the latter difficulty is evident, but an interesting discovery has been made in regard to the former: it appears likely that man's opposition to the new, which is one of his most characteristic qualities, is a radiation into all fields of thought, from the most concrete to the most abstract, of the effects of a deep-seated opposition against self-knowledge.

Unconscious.—The key to the understanding of this new science lies in the concept of the *unconscious*, one which we owe essentially to the work of one man, Freud. Converging evidence from many sources had shown the necessity of assuming the existence of mental processes remote from consciousness and even inaccessible to it. By devising a special method of investigation Freud made it possible actually to penetrate into these deeper layers of the mind and to ascertain much about the structure and significance of their content. The mind can therefore no longer be regarded as a homogeneous unity, however much that part of it may which gives us the feeling of self, and the importance of the various conflicts and incompatibilities subsisting among the different portions of the mind is increasingly recognized.

Significance of Neuroses.—Since so much of this new knowledge has been gained from study of the states known as functional nervous disorders or *neuroses*, something must be said about the general significance of these states. The main point is that the words "abnormal" and "disease" are singularly out of place in connection with them. Apart from the superficial considerations that the distinction between normal and abnormal is even more arbitrary here than elsewhere and that neurotic reactions are easily to be demonstrated with everyone, investigation of the origin and nature of such reactions convinces one that they represent little more than one particular way of responding to difficult stages in mental development which are of universal occurrence. They really constitute varieties of social adjustment rather than any disease in the ordinary sense. Neuroses are not things that happen to a person as an infection or an accident may; they are integral and dynamic expressions of the personality. They cannot be described without importing the idea of purpose, the idea of their being designed to meet certain mental situations, to cope with certain difficulties, to achieve certain aims. A great part of modern psychology is built on these pseudo-teleological conceptions, though opinions differ widely whether the most adequate formulations will prove to be truly teleological and finalistic or strictly deterministic and even mechanistic in the widest sense.

HISTORY: A. HYPNOTIC STAGE

The *history* of abnormal psychology can easily and definitely be divided into three stages: the hypnotic, the experimental and the analytical. The first two derived their inspiration from Paris, the third from Vienna. The beginnings of medical psychology are less than a century old. It is true that the material on which it was based, that of hypnotic experiences, is considerably older, but there was no psychological theory of it to begin with. In the 17th century Maxwell, and in the 18th Mesmer, made such extensive observations in this field that relatively little has been added to them since. They accounted for them by postulating the presence of a mysterious fluid of a magnetic nature which could be transmitted from one person to another. Early in the 19th century mental conceptions, such as imagination, were invoked and a struggle ensued between what were called the fluidists and the animists. First to present the latter point of view comprehensively was Bertrand, in the early 'twenties, and it was independently developed by Braid of Manchester some 20 years later. It was Braid

who first used the terms "suggestion" and "hypnotism"; his work put an end to the idea of magnetic fluid. In the eighties of the last century, however, the discussion was renewed in other terms. Charcot, the distinguished neurologist, revived the study of hypnotism, which had almost fallen into disrepute, and again attempted to account for the phenomena by physiological explanations. This was countered by Bernheim of Nancy, a pupil of a local doctor, Liébault, who practised hypnotism, and once more the animist school, which ascribed everything in the process to mental suggestion, triumphed.

The most striking feature of the observations made by employing hypnotism was that in the peculiar mental condition thus induced, hypnosis, a large number of phenomena occurred which, though evidently of mental origin, were of such a kind that cannot be normally produced by the deliberate action of the conscious will, in short, of the mind as previously conceived. For instance, changes could be produced in the functioning of various bodily organs which have no connection with consciousness and sometimes even changes in the physical state of the body. A hyperacuity beyond the normal could be induced in the sense organs for ordinary stimuli, hallucinations of non-existent stimuli brought about and "negative hallucinations" that prevented the perception of existent stimuli. Of special interest in later developments was the extension of memory in hypnosis; long forgotten and otherwise inaccessible memories could be recovered, so that one was led to suspect that perhaps no memory traces are ever obliterated. These memories could be retained or not in the subject's subsequent waking state at the hypnotist's will, so that from these and many similar observations the conclusion was forced on psychologists that consciousness was by no means an essential attribute of mental processes. It could also be proved by post-hypnotic suggestion that mental processes of which the subject was in no way conscious could lead to definite effects in conduct, so that it would not be true to regard them as merely latent.

It was at that time observed, notably by Charcot, that many of the phenomena that could be brought about in hypnosis, e.g., paralyses, contractures, anaesthesias, blindness, etc., were identical with spontaneous symptoms of a particular disorder, hysteria. He inferred that hypnosis was an artificially created hysteria, a conclusion which, though subsequently abandoned by psychopathologists, may yet contain a germ of truth. It was only much later that the relationship between the two conditions was elucidated through the discovery that hysterical symptoms, including the bodily ones, are directly produced by unconscious mental processes and, further, that they are related to post-hypnotic suggestions in being closely connected with "delayed" obedience to parental influence that has been incorporated—largely unconsciously—into the personality.

The theory of all these phenomena was slow in developing. For half a century no perceptible progress was made on the idea thrown out by Durand (1855, 1860) that a clear distinction should be effected between the "ideoplastic" and "hypotaxic" phenomena. By the former he meant all those results of implanted ideas briefly indicated above, by the latter the peculiar mental state of the subject that made them possible. The essence of this state had long been recognized to be the existence of a peculiar *rapprochement* between the subject and the hypnotist. This is an emotional relationship of intense concentration which may at times reach the pitch of rendering the subject oblivious to the presence and deaf to the voice of any other human being. In 1905 Freud's investigations led to the conclusion, subsequently amplified by Ferenczi and Ernest Jones, that the nature of the hypnotic *rapprochement* was a particular kind of erotic relationship of which the subject was quite unaware and, further, that its peculiar potency was due to a reanimation in the subject's unconscious mind of an infantile dependence on the parents.

B. EXPERIMENTAL STAGE

The second stage in the development of medical psychology was the experimental work undertaken in the eighties of the last century by Binet, Féré, and, above all, Janet. By a series of beautifully devised experiments Janet was able to demonstrate con-

vincingly the presence of mental processes, which he called "subconscious," of which the subject was quite unaware. It could be shown, for example, that this subconscious part of the mind was able to register and reproduce impressions on an anaesthetic limb when no stimuli applied to it could be detected by consciousness. The subject could feel and could not feel with the same limb, a paradox only to be described in terms of mental dissociation. The same conclusion was reached from study of more complicated mental manifestations, extensive amnesias, (gaps in memory), alternating personality, fugues (flights) and so on. Janet was able to describe a large number of hysterical symptoms in terms of mental dissociation and the problem was thus shifted to the nature and origin of this. The only explanation he was able to throw out was the assumption of a congenital tendency to dissociation, a constitutional defect in mental integration to be correlated with what he termed a fall in psychical tension, a condition favoured by such factors as fatigue, shock, distress, grief, harmful suggestions, etc.

The various forms of what are grouped together as cases of dissociated personality, which have been most exhaustively studied by Morton Prince, introduce another problem. They include alternating personality, double or multiple personality, hysterical fugues with amnesia, hypnotic somnambulism and the like. The actual problem of personality in this connection will be dealt with later, but it is necessary here to consider a feature of certain cases for the light it throws on the limitations of the conceptions just mentioned. In many of the cases it is found that of the total store of available memories one "personality" has access to all, whereas another has access to only a portion. The dissociation in question, therefore, cannot be a complete break, for it is traversable in one direction though not in the other. It is what Bernard Hart has termed an out-of-gear relationship. The noteworthy point is that all the memories concerned are accessible to one form or another of consciousness. Further they are all of a kind familiar to ordinary waking life. When a subject realizes that a part of him has been feeling sensations in an anaesthetic hand, or when a patient who has lost his memory for the past month is told that during this time he performed such and such actions, he may be astonished but he does not find it incredible. The mental processes not available to the main stream of consciousness are for this reason termed "subconscious," and it is essential to appreciate the all-important distinction between this conception and that of the "unconscious," for the processes comprising the latter are alien to any form of consciousness the subject may possess and contemplation of them is repudiated with incredulity.

C. ANALYTICAL STAGE

The third stage in the development of medical psychology was inaugurated in 1893 by the first publication of Freud's investigations. The original and fruitful work he has since done, and is still doing, has not only so deepened medical psychology as to effect a revolutionary transformation in it, but has vastly extended it beyond its early confines. We stand perhaps too near to this work to attempt a final appreciation of its true value and a storm of controversy still rages about it. At present it dominates the field of medical psychology with no serious rival to the methods, modes of approach and theories it embodies, all of which are included under the name of "psycho-analysis."

We have seen that before Freud's work it was known that in certain circumstances mental processes of a kind familiar to consciousness could be separated from the main stream of the latter. A few philosophers, notably Hartmann and Schopenhauer, had surmised that there was a still deeper mental layer, the unconscious proper, but there was at that time no means of investigating it. The importance of a curious mental state called suggestibility was also known, but no explanation of it was forthcoming. The mysterious congeries of phenomena called neurotic symptoms was popularly "explained" as due to morbid imagination, and by neurologists as being accidental disease processes with no specific meaning; incidentally, the popular view, as sometimes happens, was nearer the truth. All these topics underwent a remarkable illumination as the result of Freud's investigations.

The origin of these was the communication, in 1884, by an older colleague, Breuer, of an observation the latter had made with a patient some three years previously. It was to the effect that if the memories connected with the beginning of an hysterical symptom could be recovered in hypnosis the symptom in question would vanish, in other words, that there was an inherent connection between the presence of such symptoms and the forgetting of certain significant mental processes. After spending a few years at other work Freud pursued the train of investigation thus suggested and soon confirmed Breuer's observation. He was imbued with a deep faith in scientific determinism as applied to mental phenomena, and did not disdain to act on it even in regard to apparently trivial and meaningless phenomena which would usually be explained as being due to "chance." The object of the investigation was essentially a genetic one, and this feature has characterized all his later work, being, indeed, identical with the one just mentioned. Being forced to recognize the limitations of hypnotism as a method of investigation, Freud was led to devise one without its deficiencies, and in so doing made the most far-reaching of all his discoveries. This was what is known as the free association method, which opened the way to the exploration of the deeper layers of the mind. The essence of it is that the more the conscious guiding of a train of thought is abrogated, the more extensively is it guided by processes of which the subject is unaware. The material thus produced provided either open or disguised indications of these unconscious processes. They have to be extracted from it by an interpretative procedure and the criticism naturally arises of the necessarily subjective nature of this. It is claimed that sufficient safeguards are provided in the technique of the procedure, which is a very complicated one, to check any tendency to subjectivity. In particular the observer has first to become aware, through self-analysis, of his own unconscious processes so as to obviate the automatic temptation to bias on the one hand and to blindness on the other.

An essential part of the technique consists of the correct handling of two groups of reactions which Freud terms "transference" and "resistance" respectively. By the former is meant the tendency of the subject to allow his unconscious trends to emerge only in the form of personal references to the analyst. Various ideas, attitudes, phantasies and emotions appear in this form, but prove on investigation to have been transferred temporarily to the analyst from some other person of importance in the subject's previous life. The discovery of these earlier attitudes is thus regularly made via the person of the analyst. By resistance Freud refers to the innumerable forms of opposition that are automatically manifested whenever the subject is nearing some important unconscious material. The interpretation of the material in connection with these reactions is usually easier than might perhaps seem and it is constantly confirmed by the memories subsequently recovered and by the general piecing together of the material in the later course of the analysis. It is maintained that the converging nature of this admits of no alternative conclusions to the ones reached in the course of the interpretative procedure and that any errors in the latter are soon disclosed by the subsequent material.

PSYCHO-ANALYTICAL THEORY

Application of the free association method and accompanying technique led Freud to his three most important conclusions.

1. **The Unconscious.**—The first was the demonstration not only that many mental processes are unconscious, *i.e.*, both unconscious in themselves and completely unknown to consciousness, but also that they could be rendered accessible. The absolute inaccessibility of these processes to consciousness, apart from the use of the psycho-analytic method, differentiates the unconscious proper from the subconscious processes mentioned earlier. Two other features of it also emerged immediately. One was the dynamic nature of unconscious processes; that is, they are not merely dormant material but are constantly exercising pressure which actively influences conscious thinking and behaviour. The other was concerned with the genetic point of view, for it was shown that a number of mental acts of various kinds which had

been thought to originate in consciousness are really derivatives of deeper, unconscious processes. This, indeed, appears to hold good for all conscious processes except possibly simple responses to external stimuli (perception). The unconscious processes themselves were seen to be essentially expressions of the instinctual life, so that, as might have been expected biologically, the instincts proved to be the foundation of all mental life, the latter being an extraordinarily elaborate manifestation of impulses derived from these and interactions between one set and another.

These discoveries have an important bearing on the doctrine of *free will*, for they greatly extend the field of scientific determinism. Indeed, the whole work is based on the assumption that causeless phenomena do not exist and this assumption is amply confirmed by demonstrating in detail the actual causes of phenomena that were supposed to be due either to "chance" or to "free will," *i.e.*, to be causeless. The conception of free will, however, receives a fresh signification. While it is believed that all thought and conduct are determined by pre-existing factors, there is nevertheless an important difference between that which is automatically determined by unconscious ones and that where consciousness plays a larger part. The practical difference is that in the former case the possible responses to a given situation are much fewer, whereas in the latter they are both more varied and more likely to be adjusted to the actual possibilities in the outer world. It is the difference between the fixed and unvarying response of an insect and the freer adaptation of a higher animal; it is the latter that, when highly developed, gives rise to the conscious feeling of free choice.

It is found that the mental processes of the unconscious proper differ from those we are familiar with in many respects besides the obvious one of not being accompanied by consciousness. To begin with, they are regulated throughout by what is called the pleasure-pain principle; the only consideration that matters is the diminution of pain (in its widest sense, including all forms of discomfort) and the pleasurable gratification of various impulses. As we know, this simple rule is often subordinated in consciousness to more complex considerations; an immediate gratification is often postponed or abandoned in favour of a distant interest of the individual or of some one he cares for. This is expressed by saying that in the more conscious layers of the mind the primitive pleasure-pain principle has been evolved into the reality principle. In the unconscious the freedom of association is far greater than in consciousness; ideas that have only a slight resemblance are brought together or even fused into one, the feeling or significance attaching to one readily passes over to the other, and so on. This ease with which "displacement," as it is termed, occurs results in one idea often serving as a representative of another and is at the basis of the extraordinary part played by symbolism in connection with unconscious processes. The idea of time does not exist in the unconscious; similar events or ideas that may logically be separated from one another by many years are simply telescoped together as though they happened at the same moment.

2. **Repression and Conflict.**—By the concept of repression Freud solved the great riddle of mental dissociation which had baffled previous investigators. He came to it quite empirically. Observing that his efforts to penetrate into the deeper layers of the mind—for example, to recover lost memories—regularly met with an opposition which cost an active effort to overcome, and that this opposition or "resistance," as he called it, was always strongest just as an important part of the unconscious was being approached, he conceived the idea that the force thus exercised must be the very same force that had previously kept the unconscious thoughts from becoming conscious. There must therefore be some agency within the mind that automatically acts as an active barrier, fulfilling the functions of a censorship, and both prevents any spontaneous tendency on the part of the unconscious processes to become conscious and obstructs any effort from without to reach them.

Resistance is a phenomenon that can be observed, repression is an inference. But this inference has been extensively confirmed by careful unravelling of the relations between conscious and

unconscious processes, and in addition much has been learned about the nature and functions of the mental agency in question. Repression may be defined as a striving of a given group of agencies in the mind to keep certain mental processes from consciousness; the processes in question may once have been conscious or, which is true of the most important ones, may never have been. Conversely, unconscious processes may be defined as those which are incapable of becoming conscious. All those which are so capable, however, do not necessarily become conscious; their capacity is a potential one. Only a relatively small number are conscious at a given moment; the others are called "preconscious" and there is also a slight barrier, which, however, can be overcome in many ways, between the preconscious and consciousness. The preconscious roughly corresponds with what we considered earlier under the name of subconscious.

What has been indicated here is a doctrine of *conflict* within the mind, a conflict the very existence of which is unknown to the subject. It is between two sides of the total personality, between what is called the ego on one side and various repressed impulses on the other. The ego, which of course includes the conscious personality with its sense of "self," is a relatively consistent unity, but it is essential to realize that part of it also is unconscious, for its roots, so to speak, extend below the threshold of consciousness. This unconscious ego has to be distinguished carefully from what we have hitherto been referring to as the unconscious proper, but which should more correctly be termed the repressed unconscious. It is thus more accurate to say that the conflict is between the ego and the repressed than between consciousness and the unconscious, though the two statements overlap to a considerable extent. The nature of the conflict is essentially a moral one. The ego, from which the repressions emanate, condemns and repudiates various internal impulses on moral or aesthetic grounds. This is not an act of judgment, as might be supposed from this statement, but an automatic avoidance which is more in the nature of "flight from" and which indeed probably originated in the instinct of fear. Incompatibility is thus the secret of dissociation. To defend itself against the demands for gratification on the part of various primitive impulses the ego resorts to the flight mechanism of repression. It is the innumerable forms of failure in this mechanism that provide the only way whereby the unconscious can be investigated, hence the enormous importance attaching to abnormal psychology.

3. **Infantile Sexuality.**—Among the anti-moral or, more strictly speaking, non-moral, impulses that constitute the repressed unconscious, *e.g.*, selfish and cruel impulses, it was inevitable that sexual ones should play a considerable part, but only actual investigation revealed how very large this part is. The fact itself appears to contradict the former statements that such impulses emanate from the inborn instincts and that the super-ego is formed in opposition to them in the first years of life, but no part of psycho-analysis is more unequivocal than its conclusion that the popular belief of sexuality originating only with the reproductive functions at puberty is entirely fallacious. Not only does this instinct have a complex evolutionary history before it finally emerges in its generally recognized form, but the astonishing fact has come to light that, unlike its course in other animals, it undergoes in man two distinct developments at different ages.

The circumstance that sexuality in childhood has been so extensively overlooked and even denied is to be ascribed to the powerful repressions that occur early in life in connection with it. Freud interestingly correlates with this occurrence the mysterious loss of childhood memories that is so general. As the same factors operate throughout life, adults are prone to ignore or discount the numerous sexual manifestations to be observed during childhood. When these cannot be quite ignored they are automatically treated as sexual misdemeanours, but they are simply called "naughty habits," and the sexual nature of them is not consciously recognized. This is assisted by the fact, inevitable in the nature of the case before the reproductive function is properly established, that the manifestations are mostly of what would in an adult be termed a perverse kind, *i.e.*, they are acts that deviate from the final goal of the instinct. The puzzling per-

versions of the instinct met with in adults can be shown to be little more than the persistence, often in a somewhat altered guise, of the normal manifestations of childhood.

The periods at which the two developments in question take place are the first four or five years of life and the four or five years following puberty respectively. In the former period the development runs through a prescribed course, naturally with infinite individual variations, and the interesting point is that the same course is then repeated, on a correspondingly modified plane, when the time comes for the second period of development. This means that any particular feature in the first period, an arrest of development at one stage or a peculiar variation at another, will inevitably be repeated in the second period and will, of course, leave its trace for life. Between the two lies the so-called "latency period" during which sexual manifestations play a subordinate part and in any event do not undergo any development.

Genetic investigation of the sexual instinct traces its roots back to infancy itself. It is here characterized by leading at first no independent existence, being parasitic on the great life-preserving instincts. Thus its first manifestations are to be seen in connection with sucking activities prolonged far beyond the actual need for nourishment and occurring in respect of objects quite unconnected with nourishment. The sexual nature of these accessory acts, with their later manifestations of kissing, thumb-sucking and nail-biting, is not simply inferred from observation of them, but can be amply demonstrated by the unravelling of their numerous derivatives. The interests aroused in connection with the mouth, the so-called "oral" stage of development, extend later to other bodily functions, notably those of excretion. This alimentary or pre-genital stage thus precedes that in which concentration takes place in the genital organs proper, though some degree of genital activity, *e.g.*, what is known as infantile masturbation, occurs from a very early age.

The first period of development may also be regarded, not only from the point of view of the bodily areas concerned, but from that of the goal or object of the impulse. It is evident that to begin with this is purely concerned with the child's own body and sensations, the "auto-erotic" stage. In the next, or "narcissistic" stage, the child becomes conscious of itself as distinct from the outer world and takes itself as its first love object. Soon, however, its interests, curiosities and needs are aroused in connection with the environment, and here the other members of the family play a preponderating part. It is then that is generated the infantile conflict over incest on the solution of which will depend so much of the later character and capacities. The condemnation, and consequent repression, of sexuality at this age is almost absolute and appears to arise from internal as well as external sources. All the unconscious conflicts to be observed at various ages and in various spheres are radiations from the central conflict over infantile sexuality and the kernel of this is its incestuous nature. Endless reactions, tendencies and traits of character in later life can be shown to have originated in repudiation of incest, and there is much reason for supposing that this was the historical origin of morality and religion in the individual and the race.

The sexual instinct is not altogether set from the first in the direction of the opposite sex. On the contrary, the evidence would make it seem necessary to assume a congenital bisexuality. This complicates the original situation in regard to the parents. In addition to the normal attitude of attraction towards the parent of the opposite sex with jealousy of the other parent, the classical "Oedipus complex," there would appear to be always present more or less active indications of the opposite, the inverted Oedipus complex. The latter may become abnormally developed as a result of flight from what was originally the normal.

There is always intense repression of the early incestuous trends. Indeed, this repression is the centre and prototype of all later ones. The exact factors bringing it about are somewhat obscure, especially the relative importance of internal (inherited) and external ones. It is at all events certain that the process is connected with intense fear and guilt. The fear would seem to be essentially that of damage to the genital organs, but whether this arises purely in terms of punishment is not yet clear. The

guilt, which is in large part an elaborated product of fear, becomes later what we described above as the super-ego, the critical faculty which gives rise to, among other things, the normal conscience. The super-ego, which embodies the image of the parents, may thus be termed the heir of the Oedipus complex. The sexual and hostile attitudes towards the parents are renounced to a greater or lesser extent, the child identifies itself with its conception of the parents and so incorporates into itself their images.

A small part of these happenings is sometimes conscious and the careful observer may discover indications of this in the child's conduct, but the essential part is certainly throughout unconscious. The work done in the latter respect even at the ages of two and three years old, gives unequivocal proof that the inferences drawn from studies of adults were correct. Melanie Klein has evolved a special technique for the analysis of young children. It is thought that these early unconscious conflicts, or rather the way in which the child deals with them are of vast importance for its whole future life. Psychoanalysis makes it likely that the fundamentals of character are permanently set by the age of four or five. The possible outcomes of the conflicts, which are, of course, infinite in number, may be grouped under four headings.

OUTCOMES OF CONFLICT

1. **Sublimation.**—This term is applied to a process whereby the energy pertaining to a given sexual impulse can lose its specifically sexual exciting character and the impulse in its search for gratification be directed towards a non-sexual, and usually social, goal. The process is entirely an unconscious one and can neither be initiated nor guided by any deliberate effort. It occurs most characteristically in respect of the infantile elements ("component impulses") out of which the sexual instinct as a whole is developed. It is a reversible process, that is to say, the change is not brought about once and for all. Sublimations are of varying stability, and in certain circumstances the energy attaching to them can "regress" to its primitive form. The function of sublimation is evidently to achieve at the same time a permissible gratification for impulses which in their unaltered state would be condemned and checked and to make use of the energy thus set free for the various needs and interests of life.

2. **Reaction-formation.**—This is a barrier set up to dam back the particular repressed impulse. For instance, modesty is developed to check any tendency to self-display; cleanliness to check the infantile fondness for playing with dirt. The energy of a reaction-formation is aimed in the opposite direction to the original impulse, whereas that of sublimations flows in the same direction. Another difference is that with sublimation it is derived from the original impulse, being merely a transformation of it, but with reaction-formations it is derived from the ego or non-sexual part of the mind, opposed to the repressed impulses.

3. **Character-formation.**—Many durable character traits, such as ambitiousness, parsimony, timidity, and so on, have been traced to certain mental attitudes which became fixed in connection with the early unconscious conflicts. A very great part of the whole character originates in this way. A given trait may partake of the nature of a sublimation or of that of a reaction-formation, but more often it is a complex product. The transformation of the unconscious material (in connection with the primary conflicts) into these character traits may be incomplete, in which case we speak of a neurotic character. They are then intermediate between normal character traits and neurotic symptoms, the neurosis being built into the very structure of the character instead of appearing, as it usually does, in the form of something alien imposed from without. Such cases are harder to modify therapeutically than the commoner neurotic ones.

4. **Neurosis.**—This is the last, but by no means the least frequent, outcome of unconscious conflicts. Its appearance in this series illustrates the very important consideration, which was dealt with at some length earlier, to the effect that neurotic manifestations represent nothing more than one particular mode of responding to general mental situations; their interest is rather sociological than pathological. The importance of them to psychology as a science lies in the fact that only by the avenue

of neurotic manifestations, or borderline phenomena closely allied to them, is it possible to investigate the deeper strata of the mind, *i.e.*, the foundation on which the rest is built.

PSYCHONEUROSES

At this point we may cast back to pre-analytical days and consider, in as condensed a way as possible, the vast problem of the neuroses as a whole. Two contrasting views have always obtained on this matter, the popular and the medical respectively. According to the former, neurotic ailments are purposive; they are more or less deliberately produced by the patient's imagination for various motives, *e.g.*, securing sympathy, self-indulgence, etc. Medical practice has always been strongly influenced by the same attitude, and the corresponding treatment meted out has often been extremely drastic. Officially, however, the medical view has been that such disorders are proper diseases, for which the victims were, of course, in no way responsible. In practice a compromise was generally reached, typified by the attitude called "kind but firm." The difficulty was to ascertain the nature of the "disease," which was so plainly out of ordinary medical experience. The fiction was desperately invented that there must be some such disease but that unfortunately its traces in the brain were invisible, and so the term "functional disease of the brain" was coined. Janet's researches lent colour to the medical view by demonstrating that in many hysterical manifestations the patient was really unaware of the dissociated mental processes, so that he could hardly be held responsible for them. On the aetiological side, however, he contributed little beyond confirming Charcot's opinion that shock, both physical and mental, could play a part in addition to an hereditary disposition. Janet's work was mostly carried out in respect of the signs of hysteria rather than the symptoms. He proved, for instance, that a patient suffering from blindness or numbness could really see or feel, though with a part of the mind dissociated from consciousness. But, strictly speaking, this had little to do with the question of whether *causative* mental processes lay concealed behind the symptoms.

It was Freud who first demonstrated that hysterical and other neurotic symptoms have a meaning and in so doing he was also able to reconcile what we have called the popular and the medical views on the subject. On the one hand there turned out to be this much truth in the popular view, that neurotic symptoms are purposely brought about and that their function is to serve some quite personal interest of the patient; but this purpose is entirely unknown to the patient, for what had been regarded as a conscious process proved to be an unconscious one. On the other hand, the medical view was true in so far as such events can be regarded as something happening to the patient without his knowing why, or, therefore, being responsible for it; but it was nevertheless something purposely brought about by a part of his personality and not a disease in the sense of an external accident.

One further point in this connection. After the symptom has been in this way created it can be put to further secondary uses in the interest of the patient (to secure sympathy, escape disagreeable tasks, etc.), but only the smaller part of even these secondary uses is as a rule conscious.

The unravelling of the genesis of neurotic symptoms is an extremely complicated affair and has taught us much about the finer mechanisms of unconscious mental processes in general. In regard to the problem of the neuroses themselves, the outstanding conclusions that have emerged are that they result from unconscious conflict and represent a compromise between the two components of this conflict, and that the essential source of them invariably lies in the sexual sphere, though other adjuvant factors may also be present. The symptoms represent a disguised form of sexual gratification, but this statement has to be supplemented by two others to give it its proper meaning. In the first place, the symptoms also represent an expression of the forces opposed to the forbidden sexual impulses; it is from this that the suffering of the neuroses proceeds, the suffering, whatever form it may assume, thus signifying fear and guilt. In the second place, the impulses that obtain gratification are not sexual in the ordinary adult sense, but only the infantile compo-

nents which, as was described earlier, are destined to build up the adult instinct. What actually happens is that the subject of the future neuroses meets with some situation in life which, for reasons connected with errors in his early development, is difficult to cope with; the situation may be a really difficult one or one that would present no difficulty whatever to other people who did not possess the particular disposition. He then withdraws into phantasy in which the external difficulties are overcome in his imagination; the phantasies become more and more "introverted," more and more connected with older unconscious ones which they revive, and they ultimately re-animate the oldest, most unconscious, *i.e.*, most repressed of all, those concerning infantile sexuality. The imagined and consoling gratification of these is opposed by the ego, the energy accompanying them displaced on to associated ideas, and a compromise formation built up in which both of the opposing factors in the conflict come to expression. The structure of any neurotic symptom is thus very elaborate and the genesis of it more complex than might have been supposed. The essential point is the flight into consoling phantasy as an ostrich-like means of dealing with the real exigencies of life.

The famous psycho-analytic treatment with which the conclusions just indicated are bound up, is designed to remedy the state of affairs by introducing the unconscious part of the mind into consciousness. It recognizes that the natural method of dealing with forbidden impulses has failed; it has proved to be beyond the patient's power to repress them satisfactorily, *i.e.*, in a way that their energy can find adequate expression through various sublimations and the socially permissible amount of direct gratification. It has proved impossible to find a solution automatically and unconsciously, so the analyst decides to call in the assistance of consciousness. The process of revising the ancient infantile conflicts in the light of adult knowledge, and with the help of an ego that no longer has reason to fear the temptations of childhood, holds out every prospect of the patient finding more harmonious solutions than he previously could. The essence of it is the transferring of the decisions, judgments, condemnations, and so on, from the old irrational unconscious super-ego, with its out-of-date nursery outlook, to the conscious self, fortified as it is with all the strength of the conscious personality and the knowledge of reason. The patient is thus freed from the old tyranny and acquires a control over his full self never before possible.

When the super-ego has been built up in childhood through the imprint of disharmonious influences, there is always the latent possibility of the remarkable occurrence known as *multiple personality*. This condition may take various forms. The simplest is a mere loss of memory for a section of past life, occasionally for the whole past life and personal identity; such cases are common in the police reports. More complicated is the condition when the consciousness remaining develops attributes at variance with what was known to characterize the previous personality. If such cases are investigated by means of hypnosis, but probably not otherwise, two or more definite personalities may be developed. The relation they have to consciousness varies. They may become conscious in turns, one at a time, or there may be two consciousnesses, one being aware of the second, but not the second of the first. The splitting takes place typically in the region of the preconscious mind, and probably in the super-ego.

Adler and Jung.—Before leaving the subject of the neuroses, mention should be made of two alternative views to those of Freud put forward by Adler and Jung respectively, workers who were for a short time colleagues of his. There is much in common between their two views, especially in their negative aspects of denying the conclusions Freud reached about the deeper strata of the mind. Adler put forward the suggestion that in the neurotic mind all attributes and feeling of inferiority tend to become identified with the idea of femininity, so that the motive of the neurotic trends is to secure in an infinite number of ways a "masculine position." It can be shown that, though this view corresponds with a certain number of observations in neurotic symptomatology, it is descriptive rather than explanatory, since the formula in question is a composite product which can be analysed into a number of constituent elements. Jung's view is

harder to present, for it avowedly passes beyond the canons of science and enters the realms of both philosophy and mysticism. Essentially it consists in the reinterpretations of psycho-analytic findings into extremely abstract terms for which there is very doubtful warrant in the evidence to hand.

Insanity.—This is not the place for consideration of the very complex problems of insanity, but it must be pointed out that medical psychology, and especially psycho-analysis, has been able to throw a great deal of light on many aspects of them. The psychology of certain forms of insanity, notably paranoia (delusional insanity), manic-depressive insanity (mania and melancholia), and to some extent dementia praecox, has been elucidated in a very satisfactory degree, and even with those forms of insanity, *e.g.*, general paralysis, that depend on structural changes in the brain, the purely mental manifestations can be brought into line with our other knowledge of unconscious mental processes.

Borderline of the Normal.—To pass to the other extreme, to the borderline of normal mental functioning. There is a large class of phenomena which indubitably indicate erroneous mental functioning and therefore come under the heading of abnormal psychology, but which nevertheless are, by what might be called a general conspiracy, regarded as well within the realm of the normal. This latter feat is accomplished by removing the phenomena from the sphere of psychological determinism and agreeing to ascribe them to vague processes such as "chance," "inattention," "accident," and so on. We refer to the everyday occurrence of such errors as slips of the tongue and pen, forgetting of familiar facts (names, etc.), mislaying of objects, forgetfully omitting to carry out quite definite intentions, and a large number of similar phenomena. Freud has shown by a detailed analysis of numerous examples that these phenomena have a certain amount in common with neurotic mechanisms. It is true that their origin is not sexual (though of course it may on occasion be so), and that the source is only at times to be sought in the unconscious proper, but it can be demonstrated that they nearly all have a definite meaning and they arise from conflicts between opposing intentions which are not both clearly present in consciousness.

Dreams.—Similar remarks apply to dreams, for many of these are situate on the same borderline. The older views about dreams have been entirely superseded by the penetrating study Freud has made of them by application of his psycho-analytic method. The latent meaning behind dreams has been laid bare, the mechanisms whereby this becomes distorted into the fantastic imagery of most dreams have been elucidated, the reasons for this distortion are known, and the function itself of dreaming has been ascertained. Dreams are devices, which may or may not be successful, for allaying stimuli that would disturb sleep. They achieve this by a special mechanism which shows much in common with that of the neuroses. Thus there is an introverting regression towards unconscious, and usually infantile, material, the forging of associations with a repressed wish in this sphere, and the disguise of the imaginary fulfilment of this wish, which has, so to speak, in a consoling fashion replaced the disturbing stimulus. The detailed investigation of dream life affords one of the readiest means of access to the unconscious.

Phantasy Life.—Other products of the life of phantasy have also been extensively investigated by the methods mentioned above. We can here only enumerate a few of the fields where this work has proved fruitful; the mechanisms and functions of wit, the meaning of humour, the explanation of such opposite phenomena as uncanniness (sense of awesome strangeness in a familiar situation) and what is known by the name of *déjà vu* (sense of familiarity in a new situation), the sources of the imagination employed in such activities as art and literature, the signification of superstitions, folk-lore and mythological beliefs, and last but not least—the significance of religious emotions, beliefs and ritual.

Super-normal Phenomena.—Finally a word must be said about the vexed question of so-called super-normal phenomena, including telepathy and spiritism. In the eighties of the last century many interesting investigations of these phenomena were carried out on the lines of medical psychology by various English observers, notably Gurney and Myers. They made a number of

discoveries in the field of automatic writing, etc., which were in close agreement with the work then being done by Janet and others on subconscious processes in a state of dissociation. Unfortunately the researches soon left these lines and they have not been seriously resumed since then by medical psychologists. The chief reason for this is, obviously, lack of opportunity, for interest in psychology and in super-normal possibilities respectively has not yet proved mutually compatible; in other words, mediums appear to guard themselves solicitously against the chance of submitting to a psycho-analysis. The matter therefore remains in an atmosphere of general scepticism. It is evident that a knowledge of the unconscious must inevitably be capable of throwing much light on many of the happenings recorded in this sphere, but how much ground the conclusions thus reached would cover it is impossible to say without actual experience.

BIBLIOGRAPHY.—(A) General: The best historical accounts are given in Bernard Hart, *The Psychology of Insanity* (1912) and *Psychopathology* (1927); Ernest Jones, *The Treatment of the Neuroses* (1920); T. W. Mitchell, *The Psychology of Medicine* (1921) and *Problems in Psychopathology* (1927). For A. Adler's work see *The Neurotic Constitution—Über den nervösen Charakter*, trans. B. Glueck and J. E. Lund (1921); and for C. G. Jung, *The Psychology of the Unconscious*, trans. B. M. Hinkle (1921). (B) Pre-analytical: Morton Prince, *The Dissociation of a Personality* (1906) and P. Janet's works, most of which have been translated, are indispensable; the best of the latter is *The Mental State of Hystericals* (1921). Milne Bramwell, *Hypnotism* (1913) is an excellent text-book. (C) Analytical: Sigmund Freud has published some 20 volumes, all of which have been translated. A bibliography will be found in his *Collected Papers* (1924, etc.). The best volume to begin with is his *Introductory Lectures on Psycho-Analysis* (1926). In addition the following may be consulted with advantage: K. Abraham, *Selected Papers* (1927); S. Ferenczi, *Contributions to Psycho-Analysis*, vol. i. (1916), vol. ii. (1926); J. C. Flügel, *Psycho-Analytical Study of the Family* (1921); Ernest Jones, *Papers on Psycho-Analysis* (1923), and *Essays in Applied Psycho-Analysis* (1923). (E. J.)

ABO-BJORNEBORG: see TURKU-PORI.

ABODE. In English law this term has a more restricted meaning than domicile, being used to indicate the place of a man's residence or business, whether that be either temporary or permanent. The law may regard for certain purposes, as a man's abode, the place where he carries on business, though he may reside elsewhere; so that the term has come to have a looser significance than residence, which has been defined as "where a man lives with his family and sleeps at night" (*R. v. Hammond*, 1852, 17 Q.B. 772).

In serving a notice of action, a solicitor's place of business may be given as his abode (*Roberts v. Williams*, 1835, 5 L. J.M.C. 23), and in more recent decisions it has been similarly held that where a notice was required to be served under the Public Health Act 1875, either personally or to some inmate of the owner's or occupier's "place of abode," a place of business was sufficient. (See DOMICIL.)

ABOLITIONIST, an advocate of the abolition of slavery. The term as used in the United States referred specifically to those persons who, during the years 1830–61, made it their mission to advocate the immediate abolition of negro slavery. In spite of riots, assaults and persecutions of every kind, they carried on their task by means of the press, tracts, lectures and petitions to Congress. Among the outstanding leaders of the abolitionist movement were William Lloyd Garrison, Wendell Phillips, Lucretia Mott and John Brown. (See SLAVERY.)

ABOMASUM, the fourth or rennet stomach of ruminants. It is that part of the digestive apparatus which corresponds to the single stomach of other mammals. (See PECORA.)

ABOMEY, capital of the ancient kingdom of Dahomey, West Africa, now included in the French colony of the same name. It is 70m. north by rail of the seaport of Kotonu, and has a population of about 15,000. Abomey is built on a plain, 800ft. above sea level. The town was surrounded by a mud wall, 6m. in circumference, with a ditch 5ft. deep, filled with a dense growth of prickly acacia, the usual defence of West African strongholds. There were six gates. Within the walls were villages separated by fields, several royal palaces, a market-place and a large square

containing the barracks. In November 1892, Behanzin, the king of Dahomey, being defeated by the French, set fire to Abomey and fled northward. Under French administration the town has been rebuilt, placed (1905) in railway communication with the coast, and given an ample water supply.

ABOMINATION, anything regarded with aversion as were things contrary to omen (Lat. *ab*, from, and *ominor* forbode). Evil doctrines and impure ceremonial practices are so-called in the Bible. Hebrew authorities hold that the expression "abomination of desolation" (Matt. xxiv. 15; Mark xiii. 14) refers to the desecration of the Sacred Temple of Jerusalem by the erection of heathen statues (see *s.v.* *Jewish Encyclopedia*).

ABOR (*A-bari*-untamed), an Assam tribe inhabiting hills north of the Brahmaputra, subdivided into Minyong, Galong, Padam and other groups. They fall into patrilineal exogamous septs with traces of dual organization. A cross division exists into Mishing and Mipak—"pure" and "impure," the latter condition being hereditary, and contagious as a result of sexual intercourse, though exogamy is not affected by it. The dead are buried; monogamy prevails, but the Galongs practise the levirate and polyandry within the family circle; slavery, tattooing and segregation of the unmarried obtain, but there is no head-hunting. Public affairs are managed by elders and offenders are fined by the random confiscation of property; the property owner must execute the order of the court in order to recover from the culprit in his turn. Weapons used include long swords, crossbows, bows, poisoned arrows and spears. Men wear bark loin cloths with tails, women a string of small circular metal plates, often the only garment.

See Duff-Sutherland-Dunbar, *Abors and Galongs* (Mem. Asiatic Society of Bengal, 1916); Cumming, *The Abors* (Assam Census Report, 1921, I, Appendix B, iii.).

ABOR HILLS, a tract of country on the north-east frontier of India, occupied by an independent tribe—the Abors, who are divided into clans. They live north of Lakhimpur, between the Miri and Mishmi hills in the extreme north of Assam, where the Brahmaputra (Dihang) debouches on to the plain. The country is exceedingly difficult and entirely mountainous and forest clad, with great rivers running for miles in rocky gorges, and unnavigable beyond Pasighat. Communication is only by the roughest tracks from village to village. The rainfall is very heavy. The term Abor is Assamese signifying "barbarous" and is applied by the Assamese to many frontier tribes; but is restricted especially to the above tract. The Abors frequently raided the plains of Assam. They were first visited by the English in 1826. From 1848 they carried out numerous raids and outrages on the neighbouring territory and several expeditions were sent against them, while a blockade was instituted from 1894–1900. From 1911 onwards parties under military escort surveyed the border.

ABORIGINAL LANGUAGES, languages spoken by the native inhabitants of certain countries. The term is generally applied to tongues called non-literary languages, "jargons," broken dialects, etc., but is more correctly used of languages which, whatever their state of development, have left their individuality unimpaired upon the territory where they originated. Aboriginal languages of Africa, for example, are the Bushman (*q.v.*), dialects; of China, the Lolo (*q.v.*), Man-tse, No-su, Mo-so, etc.

ABORIGINES, a mythical people of central Italy, supposed to have descended from near Reate (an ancient Sabine town) upon Latium, whence they expelled the Siceli and settled down as Latini under a King Latinius (Dion. Halic. i. 9. 60). The etymology of the name (*ab origine*), makes them the original inhabitants (=Gr. *αὐτόχθονες*) of the country, but is inconsistent with the fact that the oldest authorities (e.g., Cato in his *Origines*) regarded them as Hellenic immigrants, not as a native Italian people. Other explanations suggested are *arborigines*, "tree-born," and *aberrigines*, "nomads."

The term "Aborigines" indicates the inhabitants found in a country at its first discovery. The Aborigines' Protection Society was founded in 1838 in England as the result of a royal commission appointed at the instance of Sir T. Fowell Buxton to enquire into the treatment of the indigenous populations of the various British colonies.

ABORTION, the premature separation and expulsion of the contents of the pregnant uterus. It is usual to call premature labour of an accident type a "miscarriage," in order to distinguish "abortion" as a deliberately induced act, whether as a medical necessity by the accoucheur, or as a criminal proceeding (see *MEDICAL JURISPRUDENCE*); otherwise the term "abortion" would ordinarily be used when occurring before the eighth month of gestation, and "premature labour" subsequently. As an accident of pregnancy, it is not uncommon, although its relative frequency, compared with that of completed gestation, has been very differently estimated by accoucheurs. It is more liable to occur in the earlier than in the later months of pregnancy, and probably occurs more readily at times corresponding to those of the menstrual discharge. It may be induced by numerous causes, both of a local and general nature. Malformations of the pelvis, accidental injuries and the diseases and displacements to which the uterus is liable, on the one hand; and, on the other, various morbid conditions of the ovum or placenta leading to the death of the foetus, are among the direct local causes. The general causes embrace certain states of the system which are apt to exercise a more or less direct influence upon the progress of utero-gestation. The tendency to recurrence in persons who have previously miscarried is well known, and should be borne in mind with the view of avoiding any cause likely to lead to a repetition of the accident. Abortion resembles ordinary labour in its general phenomena, excepting that in the former haemorrhage, often to a large extent, forms one of the leading symptoms. Treatment consists in rest, astringents and sedatives, to prevent the occurrence when it merely threatens; when abortion is inevitable, it is directed towards speedy and complete removal of the entire contents of the uterus.

Among primitive savage races abortion is practised to a far less extent than infanticide (*q.v.*), which offers a simpler way of getting rid of inconvenient progeny. But it is common among the American Indians, as well as in China, Cambodia and India, although throughout Asia it is generally contrary both to law and religion. How far it was considered a crime among the civilized nations of antiquity is uncertain.

The English law on the subject is now governed by the Offences against the Person Act, 1861, which makes the attempting to cause miscarriage by administering poison or other noxious thing, or unlawfully using any instrument, equally a felony, whether the woman be or be not with child. No distinction is now made as to whether the foetus is or is not alive, legislation appearing to make the offence statutory with the object of prohibiting any risk to the life of the mother. If a woman administers to herself any poison or other noxious thing, or unlawfully uses any instrument or other means to procure her own miscarriage, she is guilty of felony. The punishment for the offence is penal servitude for life or not less than three years, or ordinary imprisonment for not more than two years. If a child is born alive, but in consequence of its premature birth, or of the means employed, afterwards dies, the offence is murder; the general law as to accessories applies to the offence.

In all the countries of Europe the causing of abortion is now punishable with more or less lengthy terms of imprisonment. Indeed, the tendency in continental Europe is to regard the abortion as a crime against the unborn child. In the United States it is a statutory offence in all states of the Union, but the woman must be actually pregnant. In most states not only is the person who causes the abortion punishable, but also anyone who supplies any drug or instrument for the purpose.

ABORTION, CONTAGIOUS, an infective disease of cattle, horses and sheep which frequently causes premature birth in otherwise healthy pregnant females. In Great Britain the condition is most frequent and of greatest economic importance in cattle.

Cattle.—Most cases of abortion in cattle are due to the bacillus of contagious abortion, described by Bang and Stribolt in 1896; a few isolated cases, and outbreaks may arise from other causes.

The condition is widespread and is more prevalent where animal husbandry and dairy-farming are common. Although the disease is not usually fatal to the cow, temporary illness and loss of flesh occur; lactation is markedly interfered with; and many cows do not conceive again for prolonged periods, or may remain permanently sterile. At one time it was thought that the bull was the chief factor in the spread of the disease but this view is not now widely held, though it has been shown that the bull may contract the disease, and that lesions may exist in the seminal vesicles and testes, so that during coitus infection may be conveyed to the cow. The present-day belief is that the ingestion is the commonest method of contracting the disease, the principal source of the causal bacillus being discharges of an infected animal *per vaginam*. These discharges may retain their infectivity for considerable periods. In addition, the udder acts as a reservoir for the organism, which can remain located in this site without giving rise to alterations in the mammary gland; during lactation, the bacillus finds its way into the milk and may be present in the faecal matter of calves born from and reared on infected cows. Once contaminated material becomes deposited on pastures where healthy cattle are grazed, or in yards where they feed off the ground, infection is certain to follow. In non-infected herds the introduction of an infected animal is a fertile source whence the disease may spread rapidly. Naturally occurring cases of the disease are mostly confined to cattle but outbreaks have been recorded in sheep and swine. Experimentally, the disease may be transmitted to many species of animals both large and small.

The Cause.—The causal organisms are aerobic, non-motile, non-sporing, Gram-negative, short thick rods, with rounded ends having a marked tendency towards aggregation into round or irregular clusters.

Whether natural infection occurs by ingestion and entrance into the blood stream, or by way of the vagina, the bacillus reaches the uterus, which is a predilection site in the pregnant female. Here a variable amount of exudate collects between the lining membrane of the uterus and the chorionic layer of the placenta ranging from yellowish to dark brown in colour, and from thin and pus-like to thick, tenacious and glutinous in consistence. The connective tissue underlying the chorion, and also the umbilical cord, undergo alterations and become infiltrated. As a result of these changes the foetus dies in utero or is expelled. If expulsion does not occur, mummification may supervene and retention may ensue over a prolonged period.

In aborting cows, the placenta is infiltrated with a yellowish gelatinous material and whitish mucoid flakes are sometimes present, the foetal cotyledons are partly or entirely yellowish and macerated. The tissues of the foetus may be abnormally moist and the great cavities may hold quantities of blood-stained serous fluid. Infected pregnant cows may abort at any period of gestation but around the fifth to the sixth months is more common; occasionally, infected cows may undergo a normal pregnancy. Generally, in herds where the outbreak is of recent origin, abortion occurs earlier than when the affection is of longer duration.

Incidence of the Disease.—When infection is introduced amongst animals, which have been free of the disease, the incidence may be noted with an increasing frequency until eventually few animals escape. If the aborting animals are again bred from, the infection gradually subsides, until only the newly introduced animals calve prematurely. Although many cows lose their calves without premonitory symptoms, as a rule the act is preceded by a

mucoïd, purulent or blood-stained discharge; in addition, normal parturition may be observed, but usually in a very modified form.

Secondary infection of the uterus may follow, especially if the foetal membranes are retained and a condition of sapraemia or septicaemia may be set up (*see Sepsis*). Although putridity is not a character of contagious abortion, the secondary infections quickly lead to a very offensive condition of the retained placenta. As a consequence of these changes, animals become affected with a chronic endometritis with sterility as a sequel.

Some animals may become pregnant to abort a second time, but it is more usual for the animal to carry her calf to a normal parturition and to abort at the subsequent pregnancy. Statistics show that the majority of cows do not abort more than once. In the early months of pregnancy the calves are born dead; later, they may be living, and from the eighth month many are reared. Although the cow may only abort once, she may remain a carrier of the disease for a considerable time.

Diagnosis of the disease may be arrived at by the microscopical examination of the uncontaminated discharges and diseased placental membranes. Two blood tests are also available, the agglutination and the complement-fixation tests; the technique of the former has been clearly defined by M'Fadyean and Stockman and the method is now extensively used in diagnosis. Blood taken from the jugular vein of an animal may be sent to a veterinary pathological laboratory, and the result will show whether the animal is affected with contagious abortion. It is necessary to repeat the test after a few weeks as single tests are open to error when dealing with recently infected animals. The method is of value in eliminating affected animals from herds, and in preventing the introduction of newly purchased, infected animals, into clean herds. As a means of preventing spread of the disease the agglutination test is of great value; the healthy animals are separated from the reactors and kept in strict isolation; their numbers are augmented out of their own progeny, or by purchased animals, which have not reacted positively to the agglutination test.

Where this method is not adopted animals showing signs of abortion should be strictly isolated. Very rigid disinfection should be carried out especially after abortion has occurred. The foetus and the placenta should be burnt and all discharges thoroughly disinfected. The uterus may be treated with medicated douches and the external genitalia kept as aseptic as possible. In such herds the preputial hairs of the bull should be clipped and the prepuce should be irrigated with a suitable disinfectant after each service.

Every case of abortion should be regarded as of the contagious variety unless proved to be otherwise by sero-diagnostic tests. In badly infected herds every effort should be made in order that aborted cows may conceive again, so that an immune herd may be acquired eventually.

Methods of vaccination have been introduced. Both dead and living abortion bacilli have been used in the endeavour to establish an immunity. In England, the use of the living vaccine has been advised by the Ministry of Agriculture and Fisheries. The method consists in the subcutaneous inoculation of a massive dose of living abortion bacilli into the virgin heifer, or the non-pregnant cow. Intercourse is not allowed for eight weeks. The object is to establish that degree of immunity which a natural attack confers, and to prevent the undesirable *sequelae* which occur in the pregnant animal; the process should be repeated annually until the disease is controlled. Vaccination should not be resorted to in herds which are only very slightly affected, or in herds which are free of the condition.

In some countries attempts have been made to control the disease by legislative methods.

Mares.—The aetiology of this condition has been studied in various parts of the world and although several organisms have been described, the bacillus abortivo-equinus is now held to be the cause of the majority of outbreaks of mare abortion.

In Great Britain the subject has been studied by M'Fadyean and Edwards, and their observations indicate that the commonest cause of abortion in mares and joint-ill in foals is the B. abortivo-equinus.

The bacillus is small and pleomorphic; it may resemble a coccus, or occur in short, plump bacillary forms. It is motile, non-sporing and Gram-negative. It grows readily on artificial media and on agar its surface culture is characteristic. Experimentally, the disease can be transmitted to other farm animals and to small animals.

The agglutination and complement-fixation tests are applicable for diagnostic purposes.

The symptoms and lesions are in some respects similar to those observed in cattle but the placenta usually shows less alterations.

Mares are more liable to secondary complications such as laminitis, synovitis and pneumonia.

Sheep.—A vibrio has been described as the chief cause of outbreaks of abortion occurring in pregnant ewes (M'Fadyean and Stockman); these slightly curved organisms are motile and rarely exceed 3μ in length. They are Gram-negative and stain readily with the ordinary aniline dyes. They may be cultivated under somewhat similar conditions to the bacillus of contagious abortion of cattle and their distribution in naturally occurring cases follows somewhat the same lines. A similar vibrio has also been isolated from cows, which have aborted, but outbreaks of abortion in cattle are not usually regarded as being vibronic in nature. Infection may take place *per os* or *per vaginam* and the act of abortion usually follows earlier in ewes than in cows.

(A. R. S.)

ABOUKIR, a village on the Mediterranean coast of Egypt, 14½m. north-east of Alexandria by rail. The meaning of the name is "Father Cyrus," who was a Coptic saint. Stretching eastward as far as the Rosetta mouth of the Nile is the spacious bay of Aboukir, where on Aug. 1, 1798, Nelson fought the battle of the Nile. Near Aboukir, on March 8, 1801, the British army, commanded by Sir R. Abercromby, landed from its transports in the face of a strenuous opposition from a French force entrenched on the beach.

ABOUT, EDMOND FRANÇOIS VALENTIN (1828–1885), French novelist, publicist and journalist, was born Feb. 14 1828, at Dieuze, in Lorraine. Among his college contemporaries at the École Normale were Taine, Francisque, Sarcey, Challemlacour and Prévost-Paradol. Of them all About was, according to Sarcey, the most highly vitalized, exuberant, brilliant and "undisciplined." After a brief period spent at the French school in Athens he returned to Paris, and became an industrious and lively journalist. About's attitude towards the Empire was that of a candid friend. He greeted the liberal ministry of Émile Ollivier at the beginning of 1870 with delight, and welcomed the Franco-German War.

With the fall of the Empire he became a republican, and, always an inveterate anti-clerical, he fought against the conservative reaction which made head during the first years of the republic. From 1872 onwards for some five or six years his paper, the *XIX^e Siècle*, of which he was the heart and soul, became a power in the land. On Jan. 23 1884, he was elected a member of the French Academy, but died Jan. 16 1885, before taking his seat. About's best work is to be found, not in the once famous *Roman d'un brave homme* (1880), but in the books that are almost wholly farcical, *Le nez d'un notaire* (1862); *Le roi des montagnes* (1856); *L'homme à l'oreille cassée* (1862); *Trente et quarante* (1858); *Le cas de M. Guérin* (1862). Here his most genuine wit, his sprightliness, his vivacity, the fancy that was in him, have free play.

ABRABANEL, ISAAC, called also ABRABANEL, ABARBANEL (1437–1508), Jewish statesman, philosopher, theologian and commentator, was born at Lisbon of an ancient family which claimed descent from the royal house of David. Like many of the Spanish Jews he united scholarly tastes with political ability. He was a favourite of King Alphonso V., who entrusted him with important state business, but after his death in 1481 Abrabanel was compelled to flee to Spain, where he held for eight years (1484–92) the post of a minister of state under Ferdinand and Isabella. After the expulsion of the Jews from Spain in 1492 Abrabanel resided at Naples, Corfu and Monopoli, and in 1503 removed to Venice, where he was a minister of state till his death

in 1508. Abrabanel was one of the first to see that for Biblical exegesis it was necessary to reconstruct the social environment of olden times, and he skilfully applied his practical knowledge of state-craft to the elucidation of the books of Samuel and Kings.

ABRACADABRA, a word analogous to Abraxas (*q.v.*) used as a magical formula by the Gnostics of the sect of Basilides in invoking the aid of beneficent spirits against disease and misfortune. It is found on Abraxas stones, which were worn as amulets. The Gnostic physician Serenus Sammonicus gave precise instructions as to its mystical use in averting or curing agues and fevers generally. Subsequently its use spread beyond the Gnostics, and in modern times it is applied contemptuously to complicated, unscientific hypotheses.

ABRAHAM or (Genesis xi. 26–xvii. 5) **ABRAM** is the progenitor of the chosen people, the “seed” of the “promised land,” Canaan (Gen. xii. 7; xiii. 15; xv. 18, etc.). He was the

ABRAHAM, THE FIRST OF THE GREAT BIBLICAL PATRIARCHS, BEING PREVENTED BY AN ANGEL FROM OFFERING UP HIS SON, ISAAC, AS A SACRIFICE. AFTER A RELIEF OF THE LIFE OF ABRAHAM ON THE DOORS OF THE BAPTISTERY, FLORENCE, BY GIBERTI

first of the three Patriarchs. He was extolled as “the Friend of God” (Isa. xli. 8; 2 Chron. xx. 7; *cf.* James ii. 23, and also the Mohammedan tradition), and as the “Father of the Faithful” (*cf.* Rom. iv. 11). To the present day the Jews trace their descent from him and from his progeny; who in accordance with the promise were to be as numerous as “the stars in the sky” (Gen. xv. 5) and “the sand on the sea shore” (Gen. xxii. 17). On the other hand in the New Testament it is declared that God can raise up children unto Abraham from stones (Matt. iii. 9), possibly an allusion to the myth of Deucalion and Pyrrha or to an Aramaic play upon words (*b’nin* “sons,” *abnîn* “stones”). To rest in Abraham’s bosom, the bosom of the progenitor of the race, was the summit of eternal peace (Luke xvi. 22 *seq.*).

The Different Accounts.—The stories in Gen. xi. 27–xxv. 11 belong to a larger whole. The basic conception upon which they are chosen and brought together is a single one. Despite all human opposition and despite all apparent despair and hopelessness, God holds forth his promise and brings to realization his scheme of salvation. Abraham, the bearer of this promise, is the pattern of peaceful and childlike faith, who stands firm against all dangers and disappointments. From the first his difficulties were exceedingly great.

He had to leave his home and people and, following the course of the sun, go on into a foreign land, the very name of which has not been told to him by God (Gen. xii. 1). The mighty Canaanites prevent his peaceful establishment (Gen. xii. 6), so he tarries

in Shechem (xii. 6), Bethel (xii. 8), Hebron (xiii. 18), Gerar (xx. 1) and Beersheba (xxi. 33). At the very beginning he is compelled by a famine to leave Canaan and to go into Egypt, where his wife Sarai (Sara) is in danger through his untruth (Gen. xii. 10–20, *cf.* xx. 1–18, where the scene is Gerar). Hardly has he again settled in Canaan when dissensions among the shepherds bring a new danger, and he has to part from his only kinsman Lot. In calm trust in God, Abraham leaves the choice of locality to Lot (xiii. 9), who chooses the fruitful land on the other side beyond the borders of the promised land. Further difficulties arise when Lot falls into captivity (ch. xiv.) and, finally, into extreme danger, at the destruction of Sodom (ch. xix.). Nevertheless here also Abraham’s trustful confidence prevails, and he receives the promise of God in the form of a covenant (chs. xv. and xvii.). There was to be born a son to the aged and childless couple and Abraham *believed*: his calm, childlike trust represents the just relation between man and God. This is the real meaning of the famous verse (Gen. xv. 6) with which, in the New Testament, the profoundest thoughts of the Christian doctrine of justification are connected (Rom. iv. 3; Gal. iii. 6).

A new side-issue is Abraham’s marriage with Hagar, for the offspring of that union, Ishmael, cannot be heir (Gen. xvi., *cf.* xxi. 8, *seq.*). Finally Isaac, “the son of promise,” is born (xxi. 1, *seq.*), and Abraham by means of a covenant with the king of Gerar gets a footing near the borders of the promised land (xxi. 22 *seq.*). Then comes the severest test of his faith: the son of the promise must be willingly sacrificed! Even this test Abraham stands and God renews the promise (ch. xxii.), and yet towards the end of his days all that he has acquired as his estate is a grave (ch. xxiii.). This tomb of the Patriarch near Hebron is the sign that one day the whole territory shall belong to his descendants. Isaac, it is true, is still without an heir when Abraham dies in a good old age; and the old man’s last thoughts concern themselves with the marriage of his son with a woman from his far-off home (ch. xxiv.). For Isaac is the heir, not Ishmael, or the children of Keturah; and Abraham has gained nought in the land of Canaan but a grave and his belief in the Promise.

Analysis of Sources.—These stories do not form a unity. The isolated stories whose concrete perspicuousness and brevity are unsurpassed are woven into a garland of sagas. They were collected in three or four larger works and finally put together in their present form, from the above-mentioned point of view. (*See* BIBLE, OLD TESTAMENT and GENESIS.) To the latest work, the so-called Priestly Codex (P.), are ascribed Gen. xi. 27, 31, 32; xii. 4b, 5; xiii. 6, 11b, 12; xvi. 1a, 3, 15, 16; ch. xvii.; xix. 29; xxi. 1b, 2b–5; ch. xxiii.; xxv. 7–11a. As the work of the Elohist (E) are reckoned chs. xv. and xxiv. (?) in part, and nearly all chs. xx., xxi. and xxii. The rest belongs to the works of the two Jahwists (L, *i.e.*, the older “Lay-source” [so Eissfeldt] and J). The accuracy of this analysis is, however, in some details doubtful. More important is the fact that the stories, despite many noticeable duplications (*cf.* ch. xii. 10 *seq.* and ch. xx., chs. xv. and xvii., chs. xvi. and xxi.), agree in all essentials. The etymological explanations of names and word-plays are of fundamental importance as stylistic criteria.

Historical Value.—The style and content of the stories deviate from strictly historical writing. The narrative does not concern itself with the political, social and economic events and conditions in the life of the peoples (with the sole exception of ch. xiv., on which see below), but with family idylls, delineated with an artist’s love, the details of which, however, are beyond the reach of the historian. The question, therefore, of the real historical worth of the details is difficult to decide. On the other hand, scepticism as to the historicity of the patriarch himself goes too far. Some would suppose that the figure of Abraham owes its origin merely to the imagination of the poet; or that Abraham is merely a personification of the people who derived themselves from him, and that the sagas and legends concerning him and other patriarchs are only a reflection of later tribal history. According to other scholars, the heroic figure of Abraham is based on a Canaanite god who was worshipped in the holy

trees of Shechem and Hebron. In this case the Israelites are supposed to have taken over the cult-centres and the rites; although, judging from their hatred of the earlier peoples, it is not very likely that they humanized their gods and heroes and regarded them as the progenitors of their own people. All these explanations, however, have an air of unreality about them. From beginning to end all that Abraham does and suffers is peculiar to individuals. Mythical outlines are wholly wanting, even miracles are not ascribed to him (in contrast, for example, to Moses). Even his human failings are not disguised (his untruth, xii. 13; xx. 2; his frailty, xvi. 6; his doubts, xvii. 17). Were his shape devised with something of the idea of establishing Israel's right to Canaan, one would look for some other sort of figure. According to the later sagas—some of which have been preserved—the Patriarchs were mighty heroes who conquered the land with signs and miracles, and held firmly to the later sacrificial and food laws. It is just the unfavourable traits in the characters of the Patriarchs and the undesirable traits in their lives, and the consciousness of a difference between the patriarchal and the Mosaic period as regards the idea of God and the cults, that must rest on an historical foundation.

The Two Names: Abram and Abraham.—The double name is peculiar, *Ab-ram* means "the father is exalted" or "the exalted father"; the word "Patriarch" is really nothing more than a Greek translation of this name. Lesser known bearers of the name were called *Abīram* (Num. xvi., etc.). *Ab-rāhām* is the new name which the patriarch received from God from the moment of the solemn covenant (Gen. xvii. 5). A new name—mostly with a slight variation (*cf.* Sarai-Sara, Hosea-Joshua, Eliakim-Jehoia-kim, Saul-Paul)—indicates a new period in the life of the bearer. This name is explained in Gen. xvii. 5 as "Father of a Multitude," which in Hebrew would be *Ab-hamon*; but the second part of the compound is preferably compared with an Arabic word for "crowd" (*rūhām*). This explanation is however probably a popular etymology: it is most probable that the two names Abram and Abraham mean precisely the same thing. *Abram* may be the Accadian (Babylonian) and *Abraham* the Amorite (Canaanite) form of the same name. It is among the Amorite peoples in Babylonia during the first dynasty that names are found like *Abaram*, *Abam-rama*, and probably even *Aba-raham* (*cf.* for the last form Lutz, *Early Babylonian Letters from Larsa* [1917], No. 15). Thus it seems that this name was in use in Abraham's old Babylonian home, the regions of Ur and Larsa.

Chronological Questions.—For determining the date of Abraham the 14th chapter of Genesis is the starting point. In this noteworthy chapter are given the names of kings and lands, and Abraham appears as a war-like hero. The identification of these kings with the great Babylonian king Hammurabi and those of his time would seem to be erroneous. It is probable that the chapter deals with a punitive expedition undertaken by two princes of the middle Euphrates (*Amraphel*; i.e., *Amur-apil* and *Arioch* or *Āriaka*) in the service of the allied kings of *Khatti* (*Tid'al*; i.e., *Tid'alia*, *Dudhalia*). They were beaten by the attack of a much smaller number of Hebrews under Abraham: it was the unforgettable first military exploit of this people on Canaanite soil. Now, of these kings we know from the cuneiform inscriptions that *Tid'al* (I.) was the founder of a dynasty of the kingdom of the Hittites (*Khatti*), and that he lived somewhere about 1550 B.C. (or at the latest 1450 B.C.). It is therefore probable that we must place the time of Abraham about this date. With this agrees the little that we know of the political life of the dark age after the downfall of the Hyksos kingdom. The biblical chronology does not actually contradict this late dating, for the dates in Gen. xxi. 5; xxv. 26; xlvii. 9; Exod. xii. 40 and 1 Ki. vi. 1 belong to an artificial scheme, whereby precisely 12 centuries elapse from the birth of Abraham to the building of Solomon's temple. To make up these 12 centuries the length of a generation was reckoned first as 100 years, then as 40. But the older literary sources in the Old Testament give another picture; above all, the genealogical tables present good ancient evidence. On the basis of statements such as are found in Gen. xv. 16; xxxvi. 31–

39 (*cf.* Num. xx. 14); Gen. i. 23; Exod. vi. 16–20, Ruth iv. 18–22, the period between Abraham and David must at the most be reckoned as 600 years, probably much shorter.

From the historical point of view Abraham's journey from Mesopotamia to Canaan is directly bound up with the wandering of the Moabites, Ammonites and Edomites to the south-west and southern Canaan, and with the wanderings of the Aramaeans to Syria. An invasion by the non-Semitic tribes of the Mitanni and Kharri (about 1600 B.C.) expelled these Hebrews and Aramaeans from their old homes on the middle Euphrates, in a south-westerly direction. In the course of this migration individual Hebrew families (*viz.*, Abraham and his kindred) came to Canaan; but there was no intention in the first instance of conquering this ancient land of culture.

The Religious Significance.—It has been shown that Abraham's journey from Ur (Gen. xi. 28) *via* Harran (xi. 31) to Canaan was merely a part of a greater movement of peoples. But, according to Biblical tradition, this journey had a precise objective and aim; God's direct command already contained a religious motive (Gen. xii. 1 *seq.*). Abraham is no leader of a Bedouin tribe seeking plunder and conquest; his significance lies rather in the field of religion. He is not, in the first instance, the progenitor of the people but the founder and leader of a religious movement. Like Mohammed, some 2,000 years later, he stood at the head of a great movement among the Semitic peoples and tribes. Naturally, his adherents were bound to each other firmly by blood ties. Abraham's religion was characterized by abstraction and was yet personal. The *one* great God, throned in Heaven, honoured without priests and Temple, the Almighty and all-comprehending One, to whom the faithful have personal access—this is Abraham's God so far as we can gather from our sources. And that is more important for us than the question of the details of the tradition. While Abraham's forefathers in Mesopotamia served other gods (Josh. xxiv. 2), "The God who redeemed Abraham" was the same as the God of Moses (*cf.* Exod. iii. 6, 13 *seq.*) and of Elijah (1 Ki. xviii. 36). According to the Old Testament, Abraham was the founder of the Israelite faith, and Moses the founder of the nation's thought and reformer of the cultus.

(1923–25), and in a paper (Dutch), *The Period of the Patriarchs* (1925). (F. M. T. B.)

ABRAHAM A SANCTA CLARA (1644–1709), Austrian divine, was born at Kreenheinstetten, near Messkirch. His real name was Ulrich Megerle. In 1662 he joined the order of Barefooted Augustinians, became a popular preacher, and assumed the name by which he is known. In this order he rose step by step until he became *prior provincialis* and *definitior* of his province. He died at Vienna on Dec. 1, 1709. In his published writings he displayed the same force and homeliness as in the pulpit.

BIBLIOGRAPHY.—His works have been several times reproduced in whole or in part, though with many spurious interpolations. The best edition is that published in 21 vols. at Passau and Lindau (1835–54). See Th. G. von Karajan, *Abraham a Sancta Clara* (Vienna, 1867); H. Maret, *Über Judas d. Erzscheim* (Vienna, 1875); Schnell, *Pater A. a S.C.* (Munich, 1895); Sexto, *Abraham a S.C.* (Sigmaringen, 1896); Blanckenburg, *Studien über die Sprache Abrahams a S.C.* (Halle, 1897).

ABRAHAM, WILLIAM (1842–1922), British Labour politician of the old school, was born in the Afon valley and went to work in a coal mine at the age of nine. He was affectionately known by the name of Mabon, a name originally adopted by him in Eisteddfod competitions. President of the South Wales Miners' Federation, he was a power in South Wales, and he remained a respected figure to the end. He sat in the House of Commons for Rhondda from 1885 to 1920, and died on May 14, 1922.

ABRAHAM IBN DAUD (c. 1110–80), Jewish historiographer and philosopher of Toledo. His historical work was the *Book of Tradition* (*Sepher Haqabala*), a chronicle down to the year 1161. It was translated into Latin by Générard (1519). His philosophy was expounded in an Arabic work better known under its Hebrew title *'Emumah Ramah* (*Sublime Faith*). This was translated into German by Weil (1882). Ibn Daud was one of the first Jewish scholastics to adopt the Aristotelian system. Maimonides owed a good deal to him.

ABRAHAM, THE PLAINS OF, a plateau to the southwest of the city of Quebec, the scene of the historic battle between the French under Montcalm and the English under Wolfe on Sept. 13, 1759. (See QUEBEC.)

ABRAHAMITES, a sect of deists in Bohemia in the 18th century, who professed to be followers of the pre-circumcised Abraham, and declined to be classed either as Christians or Jews. Believing in one God, they contented themselves with the Decalogue and the Paternoster. As a religious sect they disappeared by the end of the century.

ABRAHAM-MEN, the nickname for vagrants who infested England in Tudor times. The phrase is as old as 1561, and was due to these beggars pretending that they were patients discharged from the Abraham ward at Bedlam. On his discharge the genuine Bedlamite, provided he wore a badge, was allowed to roam the country, soliciting alms. This humane privilege was grossly abused, and thus gave rise to the slang phrase "to sham Abraham."

ABRAMS, LEROY (1874–), American botanist, was born in Sheffield, Ia., Oct. 1, 1874. He graduated at Stanford university, Calif., in 1899, continued study there in 1900–04 and at Columbia university in 1904–05, receiving his Ph.D. degree in 1910. In 1906 he became assistant professor of botany in Stanford university; in 1912, associate professor; and in 1920 was made professor of botany and curator of the Dudley herbarium. His researches have been connected chiefly with the flora of the Pacific coast region of the United States. His published works include *Flora of Los Angeles and Vicinity* (1904, 1917), *A Phytogeographical and Taxonomic Study of the Southern California Trees and Shrubs* (1910) and *Illustrated Flora of the Pacific States* (1923).

ABRANTES, a town of central Portugal, in the district of Santarem, on the right bank of the river Tagus. Pop. (1920), 7,215. Abrantes is a fortified town, with trade in fruit, olive oil and grain. It is of military value as it commands the highway down the Tagus valley to Lisbon. Founded about 300 B.C. as an Iberian settlement, it was called Aurrantes by the Romans; perhaps owing to the alluvial gold (*aurum*) of the Tagus. It was captured on Nov. 24, 1807, by the French under General Junot, who for this achievement was created duke of Abrantes. By the Convention of Cintra (Aug. 22, 1808) the town was restored to the British and Portuguese.

ABRASIVES. Abrasion is a scratching action and depends on the relative hardness of the two materials—the abrasive and the one abraded. The degree of hardness of a material, as determined by scratching, has long been used by mineralogists for distinguishing one mineral from another, and F. Mohs in 1820 devised a scale of hardness for minerals, which is still in use. Mohs's scale is:—

- | | | |
|--------------|-------------|--------------|
| 1. Talc. | 5. Apatite. | 8. Topaz. |
| 2. Gypsum. | 6. Felspar. | 9. Corundum. |
| 3. Calcite. | 7. Quartz. | 10. Diamond. |
| 4. Fluorite. | | |

Diamond at No. 10 is the hardest of all minerals and indeed of all known substances. Steel (a knife-blade or file) will scratch felspar but not quartz, and it is itself scratched by quartz; it can therefore be set at 6½ on the scale. Window-glass at 5½ can be abraded and polished by felspar. The higher a material stands in the scale the more efficient is it as an abrasive, diamond being the most efficient of all.

Mohs's scale is arbitrary and merely comparative, and it gives no absolute measure of the degree of hardness of a material. Attempts have been made to arrive at this by various methods: such as by measuring under a microscope the depth of scratch produced

by a diamond point under a certain load; or by determining the amount of work done in grinding away a certain weight or volume of material. From such experiments it is found that the gap between 10 and 9 on Mohs's scale is even greater than that between 9 and 1, emphasizing again the efficiency of diamond as an abrasive.

Brittleness or friability is another physical character to be considered in addition to hardness. Carborundum although exceeding corundum in hardness is much more brittle, and it soon crushes and rubs down to a fine flour. Diamond with rough usage breaks along the directions of perfect cleavage in the crystal. For this reason carbonado, a compact aggregate of minute diamond crystals, rather than a single crystal, is used in rock-drills.

The form in which abrasives are used varies for different purposes. The material may be crushed and sieved to different degrees of fineness. This may be used as a loose powder for grinding; or it may be glued on cloth or paper, or bonded with cements in the form of grinding wheels or hones. Other abrasives are used in block form cut to a suitable shape, as grindstones, millstones, scythe-stones, whetstones, pumice blocks, etc. Besides being used for grinding and polishing metal, stone, wood, leather, etc., abrasives are also employed for cutting, drilling, and boring.

In addition to natural minerals, certain artificial products are also used for abrasive purposes. For example, powdered glass as glass-paper, crushed steel for stone cutting, and the important carborundum. Corundum is also produced artificially on a large scale. Carbides of boron, tantalum, and tungsten are extremely hard, and these may in the future find technical applications.

In the following list the various abrasive agents are arranged according to their degree of hardness, *i.e.*, in the order of their efficiency. Further information respecting each of these materials will be found in the separate articles (see DIAMOND, etc.).

Diamond (Hardness = 10). This is a crystallized form of carbon, and only the natural mineral is available. Cloudy, spotted, and imperfectly crystallized stones, known as bort, and small fragments that cannot be cut as gems are crushed to powder for use as an abrasive. Diamond powder is the only material with which diamond itself can be ground and polished.

Carborundum (H.=9½). This artificial product is a crystallized carbide of silicon (CSi), and since its discovery in 1891 it has more and more replaced mineral abrasives. It is produced in large quantities by heating coke and sand in electric furnaces at Niagara Falls. It is used in the form of powder either loose or on cloth, or is made up with porcelain, shellac, or other bonding material in the form of grinding wheels, hones, etc. This material is sold under a variety of trade-names—crystolon, carbolon, samite, etc.

Corundum (H.=9) is the crystallized oxide of aluminium (Al₂O₃), a mineral which in its gem varieties is ruby and sapphire. Rough corundum is found as large crystals in certain kinds of igneous rock in Canada, North Carolina, Ural Mountains, Madagascar, South Africa, the last being now the principal producer of material for abrasive purposes. *Emery* is an impure granular variety of corundum mixed with magnetite and other minerals, and it is not quite so hard as the purer crystal or rock corundum. It is mined in Naxos, Asia Minor, and the State of New York. Much corundum is now produced artificially by fusing bauxite in electric furnaces at Niagara Falls, the product being sold under the names alundum, adamite, aloxite, lionite, etc.

Garnet (H.=6½–7½) as mined in the eastern United States and in Spain for abrasives is mainly the almandine variety, a silicate of iron and aluminium. It is largely used for making garnet-paper (often sold as "emery-paper").

Quartz (H.=7) is a crystallized form of silica (oxide of silicon, SiO₂) and is the commonest of all minerals, occurring in a bewildering variety of forms. It finds extensive applications as an abrasive. Millstones, grindstones, and pulpstones (for grinding wood in the manufacture of paper) are made of quartz-rock, quartzite, burrstone, grit, or sandstone. Whetstones are made of hornstone, lydian-stone, Arkansas-stone, and other compact varieties of quartz. In the form of sand, quartz is used as a sand-blast, as sand-paper, in scouring-soap, and for cutting and grinding

marble. Pebbles and flints are used for grinding cement materials and clinker.

Steel (H. = 6½). Crushed crucible steel, crushed cast iron, and steel shot are used in stone cutting.

Felspar (H. = 6), the potash-felspar, orthoclase or microcline (KAlSi₃O₈), is used for polishing plate-glass and in scouring-soaps.

Glass (H. = 5½), powdered glass as glass-paper or "sand-paper."

Pumice (H. = 5½), a natural volcanic glass blown by included steam into a cellular mass. The best block pumice is from the Lipari Islands, and enormous quantities of pumice-dust are available in the United States.

Opal (H. = 5), a hydrated glassy form of silica, found in a powdery form as large deposits of tripoli, diatomaceous or infusorial earth, and largely used for polishing and in scouring-soap.

Rotten-stone, chalk, rouge, putty-powder, and other softer grinding and polishing materials might also be mentioned.

Abrasives, in the household, are substances of an erosive nature used for polishing or cleaning purposes. Those best suited for this use are fine sand, emery, crushed pumice and chert, which consists of siliceous skeletons of sponges and marine shells. These materials are often mixed with a solution of soap, so that there is a cleansing action as well. In the cleaning of aluminium, steel wool, in combination with an abrasive powder or soap, has a wide usage. Abrasives are in very general use to-day and have done much to lighten the housewife's work. They may be purchased in paste, powder or cake form and used for cleaning and polishing all kinds of metals, as well as scouring paint and enamel ware.

(L. J. S.)

ABRAUM SALTS (from the German *Abraum-salze*, salts to be removed), the name given to a mixed deposit of salts, including chlorides and sulphates of sodium, potassium and magnesium, found in association with rock-salt at Stassfurt in Prussia.

ABRAXAS or **ABRASAX**, a word probably first used by the Basilidians and engraved on certain antique stones, called on that account *Abraxas stones*. The letters of ἀβραξάς in the Greek notation make up the number 365, and the Basilidians gave the name to the 365 orders of spirits which emanated in succession from the Supreme-Being. These orders were supposed to occupy 365 heavens, each fashioned like but inferior to that above it, the lowest being the abode of the spirits who formed the earth and its inhabitants, to whom was committed the administration of its affairs. In addition to the word Abraxas the stones often have cabalistic figures engraved on them.

ABROGATION, the annulling or repealing of a law by legislative action or by usage. Abrogation, which is the total annulling of a law, is to be distinguished from the term *derogation*, which is used where a law is only partially abrogated. Abrogation may be either express or implied. It is express either when the new law pronounces the annulment in general terms, as when in a concluding section it announces that all laws contrary to the provisions of the new one are repealed, or when in particular terms it announces specifically the preceding laws which it repeals. It is implied when the new law contains provisions which are positively contrary to the former laws without expressly abrogating those laws. The abrogation of any statute revives the provisions of the common law which may have been abrogated by that statute. (See **STATUTE**; **REPEAL**.)

ABRON, a longheaded tribe, physically akin to the Fanti, living on the Ivory Coast (Bondoukou region) and between Kintampo and Salaga, Gold Coast. The natives are husbandmen and traders, and they practise Animism. There are small kingdoms made up of several provinces. The family is constituted by several sub-groups which embrace a number of households. Mar-

riage between cross-cousins is frequent. Descent is reckoned in the paternal lines. Inheritance passes to the maternal uncle, then to the nephew, the sister's son. Society consists of (a) nobles, (b) freemen, and (c) slaves and descendants of slaves. The judiciary organization is fairly well developed.

See Tauxier, *Le Noir de Bondoukou* (1921).

ABRUZZI E MOLISE, a group of provinces (*compartimento*) of Southern Italy. The total area is 5,951 sq.m. and the population (1921) 1,399,980. The interior is mountainous including the central portion of the Apennines and their culmination, the *Gran Sasso d'Italia*. The coastal hills consist mainly of somewhat unstable clay and sand; the zone of level ground along the coast is quite inconsiderable. The 100 miles of coastline have not a single harbour of importance. Climate varies with altitude, the highest peaks being covered with snow for most of the year, while the valleys running north-east towards the sea are fertile and well watered by several small rivers, the chief of which are the Tronto, Vomano, Pescara, Sangro, Trigno and Biferno. These are fed by minor streams, such as the Aterno and Gizio, with valleys between the main chains of the Apennines. They may be suddenly swollen by rains, and floods and landslips often cause damage. This danger has been increased, as elsewhere in Italy, by indiscriminate timber-felling without provision for reafforestation, though considerable oak, beech, elm and pine forests still exist and are the home of wolves, wild boars and even bears. The woods have large herds of swine, and the hams and sausages of the Abruzzi are famed. The rearing of cattle and sheep was at one time the chief occupation, and many flocks are still driven down to the Campagna di Roma for the winter and back again in the summer, but more cultivation is now done, especially in the valleys and in the now drained bed of Lago Fucino where beet sugar is produced. Industries are small but various: e.g., arms and cutlery at Campobasso and Agnone and majolica at Castelli and elsewhere. Liqueurs are also made in several places. The river Pescara and its tributary the Tirino form an important source of power for generating electricity. Communications are not easy. Railways are (1) the coast railway (a part of the Bologna-Brindisi line), with branches from Giulianova to Teramo and from Termoli to Campobasso; (2) a line diverging S.E. from this at Pescara and running via Sulmona (whence there are branches via Aquila and Rieti to Terni, and via Carpinone to (a) Isernia and Caianello, on the line from Rome to Naples, and (b) Campobasso and Benevento), and Avezzano (whence there is a branch to Roccasecca) to Rome, (3) a connecting line between the coastline (at Ortona and S. Vito Lanciano) and the line from Sulmona to Isernia (at Castel di Sangro). There are, consequently, no large towns. The district was, in Lombard times, part of the duchy of Spoleto, and, under the Normans, a part of that of Apulia; it was first formed into a single province in 1240 by Frederick II., who placed the *Iusticiarius Aprutii* at Sulmona and founded the city of Aquila. After the Hohenstaufens lost their Italian dominions, the Abruzzi became a province of the Angevin kingdom of Naples, to which it was of great strategic importance.

ABRUZZI, DUKE OF THE (1873–), Italian vice-admiral and explorer, son of Amadeo, duke of Aosta, was born at Madrid Jan. 29, 1873, and named Luigi Amadeo. Although he had a distinguished naval career he achieved fame also as a traveller and mountaineer. He was the first to ascend Mt. St. Elias in Alaska (1897) and in 1899 he organized a North Pole expedition, part of which reached lat. 86° 3' N., at that time the record of northern exploration, he himself being forced to remain behind owing to frostbite. In 1906 he was the first to ascend the Ruwenzori in East Africa, reaching the twin summits (16,800 ft.) which he named Margherita and Alexandra, and making the first detailed map of the Ruwenzori. In 1909 he ascended K 2 in the Himalayas to an altitude of over 20,000 ft. and on July 18 Bride peak to 24,600 ft. During the World War he commanded the naval

forces in the Adriatic, but he resigned in 1917 owing to disagreements with Admiral Thaon di Revel, his chief of staff, and retired from the service. Afterwards he undertook to carry out an important colonization scheme in Italian Somaliland.

English translations of his works are *The Ascent of Mount St. Elias* (1900); *Ruwenzori* (1909).

ABSALOM, the third son of David, and his father's favourite. The picture presented in II. Sam. xiii.-xix. (which deals mainly with his life) suggests that he was the Alcibiades of the Old Testament, alike in his personal attractiveness, his lawless insolence and his tragic fate. He is first mentioned as murdering his half-brother Amnon, David's eldest son, in revenge for the rape of his full sister Tamar. This deed drove him into banishment, but he was eventually restored to favour through the good offices of Joab. Later, when, some uncertainty seems to have arisen as to the succession, Absalom organized a revolt. For a time he seemed to be completely successful; David with a few followers and his personal guard fled across the Jordan, leaving to Absalom Jerusalem and the main portion of the kingdom. The usurper pursued the fugitives with his forces but was completely defeated in "the wood of Ephraim" (apparently west of Jordan, if the text be right), and killed by Joab, who found him caught by the hair in an oak-tree. To the affectionate chivalrous heart of David, the loss of his son, worthless and treacherous as he was, brought grief which more than outweighed his own safety and restoration.

ABSALON (c. 1128-1201), Danish archbishop and statesman, was born about 1128, the son of Asser Rig of Fjenneslev, at whose castle he and his brother Esbjorn were brought up with the young prince Valdemar, afterwards Valdemar I. He was sent later to the University of Paris. Absalon first appeared in Saxo's chronicle as a fellow-guest at Roskilde, at the banquet given in 1157 by King Sweyn to his rivals, Canute and Valdemar. Both Absalon and Valdemar narrowly escaped assassination at the hands of their treacherous host on this occasion, but at length escaped to Jutland, whither Sweyn followed them, to be defeated and slain at the battle of Grathe Heath.

In the same year (1158) in which Valdemar ascended the Danish throne, Absalon was elected bishop of Roskilde. Henceforth Absalon was the chief counsellor of Valdemar, and the promoter of that imperial policy which, for three generations, was to give Denmark the dominion of the Baltic. Briefly, it was Absalon's intention to clear the northern sea of the Wendish pirates, who inhabited that portion of the Baltic littoral which we now call Pomerania, and ravaged the Danish coast so unmercifully that at the accession of Valdemar one-third of the realm of Denmark lay waste and depopulated. The very existence of Denmark demanded the suppression and conversion of these stiff-necked pagan freebooters, and to this double task Absalon devoted the best part of his life.

The first expedition against the Wends, conducted by Absalon in person, set out in 1160, but it was not till 1168 that the chief Wendish fortress, at Arkona in Rügen, containing the sanctuary of their god Svantevit, was surrendered, the Wends agreeing to accept Danish suzerainty and the Christian religion at the same time. From Arkona Absalon proceeded by sea to Garz, in South Rügen, the political capital of the Wends, and an all but impregnable stronghold. But the unexpected fall of Arkona had terrified the garrison, which surrendered unconditionally at the first appearance of the Danish ships. Absalon, with only Sweyn, bishop of Aarhus, and 12 "housecarls," thereupon disembarked, passed between a double row of Wendish warriors, 6,000 strong, along the narrow path winding among the morasses, to the gates of the fortress, and, proceeding to the temple of the seven-headed god Rügievit, caused the idol to be hewn down, dragged forth and burned. The whole population of Garz was then baptized, and Absalon laid the foundations of 12 churches in the isle of Rügen.

The destruction of this chief sally-port of the Wendish pirates enabled Absalon considerably to reduce the Danish fleet. But he continued to keep a watchful eye over the Baltic, and in 1170 destroyed another pirate stronghold, farther eastward, at Dievenow on the isle of Wollin. Absalon's last military exploit was

the annihilation, off Strela (Stralsund), on Whit Sunday 1184, of a Pomeranian fleet which had attacked Denmark's vassal, Jaromir of Rügen.

He was now only 57, but his strenuous life had aged him, and he was content to resign the command of fleets and armies to younger men, like Duke Valdemar, afterwards Valdemar II., and to confine himself to the administration of the empire which his genius had created. The aim of his policy was to free Denmark from the German yoke. It was contrary to his advice and warnings that Valdemar I. rendered fealty to the emperor Frederick Barbarossa at Dôle in 1162; and, when, on the accession of Canute V. in 1182, an imperial ambassador arrived at Roskilde to receive the homage of the new king, Absalon resolutely withstood him.

"Return to the emperor," cried he, "and tell him that the king of Denmark will in no wise show him obedience or do him homage."

As the arch-pastor of Denmark, Absalon also rendered his country inestimable services, building churches and monasteries, introducing the religious orders, founding schools and doing his utmost to promote civilization and enlightenment. It was he who held the first Danish Synod at Lund in 1167. In 1178 he became archbishop of Lund, but very unwillingly, only the threat of excommunication from the Holy See finally inducing him to accept the pallium. Absalon died on March 21, 1201, at the family monastery of Soro, which he himself had richly embellished and endowed.

Absalon remains one of the most striking and picturesque figures of the middle ages, and was equally great as churchman, statesman and warrior. There can be no doubt that he enjoyed warfare; and his splendid physique and early training had well fitted him for martial exercises. He was the best rider in the army and the best swimmer in the fleet. Yet he was not like the ordinary fighting bishops of the middle ages, whose sole concession to their sacred calling was to avoid the "shedding of blood" by using a mace in battle instead of a sword. Absalon never neglected his ecclesiastical duties, and even his wars were of the nature of crusades. Moreover, all his martial energy notwithstanding, his personality must have been singularly winning; for it is said of him that he left behind not a single enemy, all his opponents having long since been converted by him into friends.

(R. N. B.)

ABSCCESS, a collection of pus localized in solid tissues. When situated in a cavity special names are applied; e.g., empyema (pleural cavities), hypopyon (aqueous chamber of eye), pyosalpinx (Fallopian tube). The usual method of formation is as follows. When staphylococci or other pyogenic organisms have reached some spot, being carried thither by the blood stream or directly introduced, they begin to multiply and form their specific toxin. This causes death of tissue cells in the neighbourhood and the resulting proteid material serves as nutriment for further multiplication of the organisms. The irritant action of the toxins leads to local inflammatory changes in the tissues whereby extension of bacterial growth and effects are limited. The inflammatory fluid poured out by the congested blood vessels (see INFLAMMATION) coagulates (hence the early firmness to touch), but the coagulum and the dead tissue cells are soon liquefied by ferments produced by the bacteria (hence the fluidity of the contents of an abscess).

Throughout the whole process multitudes of leucocytes have left the blood vessels and collected at the seat of inflammation. These give to the abscess fluid its characteristic creamy appearance. Were it not for the zone of surrounding inflammation the irritant and destructive action of the micro-organisms would extend indefinitely, and something akin to this occurs if the bacteria be particularly virulent or the resisting powers of the individual unusually low. The fluid in an abscess "points" in the direction of least resistance. Frequently this is towards the surface, or the pus may track along the muscle. When an abscess

opens on the skin, the repair tissue in its walls usually brings about healing through the formation of scar tissue; when it opens into a serous cavity (*see* COELOM) it leads to a generalized suppuration probably fatal unless surgically treated with success. (W. S. L.-B.)

ABSCISSA. In Cartesian co-ordinates (*see* CO-ORDINATES) the abscissa of a point (P) is the part (OP') of the x axis lying between the origin (O) and the point (P') where a line (PP') parallel to the y axis cuts the x axis. In each of the two figures, the line-segment PP' is also called the abscissa of P . The axis of x (OX) is called the *axis of abscissas*. The term was used in its technical sense by Pietro Mengoli in 1659.

ABSCISSION, a tearing away, or cutting off; a term used sometimes in prosody for the elision of a vowel before another, and in surgery especially for abscission of the cornea, or the removal of that portion of the eyeball situated in front of the attachments of the recti muscles; in botany, the separation of spores by elimination of the connection.

ABSCOND, to depart in a secret manner; in law, to remove from the jurisdiction of the courts or so to conceal oneself as to avoid their jurisdiction. A person may "abscond" either for the purpose of avoiding arrest for a crime (*see* ARREST) or for a fraudulent purpose, such as the defrauding of his creditors (*see* BANKRUPTCY).

ABSENCE, the fact of being "away," either in body or mind. The special occasion roll-call at Eton College is called "Absence," which the boys attend in their tall hats. A soldier must get "leave of absence" before he can be away from his regiment. Seven years' absence with no sign of life either by letter or message is held, by English law, to be presumptive evidence of death.

ABSENTEEISM, a term used primarily of landed proprietors who absent themselves from their estates, and live and spend their incomes elsewhere; in its more extended meaning it includes all those (in addition to landlords) who live out of a country or locality but derive their income from some source within it. Absenteeism is a question which has been much debated, and from both the economic and moral point of view there is little doubt that it has a prejudicial effect. To it has been attributed in a great measure the unprosperous condition of the rural districts of France before the Revolution, when it was unusual for the great nobles to live on their estates unless compelled to do so by a sentence involving their "exile" from Paris. It has also been an especial evil in Ireland, and many attempts were made to combat it. As early as 1727 a tax of four shillings in the pound was imposed on all persons holding offices and employments in Ireland and residing in England. This tax was discontinued in 1753, but was re-imposed in 1769. In 1774 the tax was reduced to two shillings in the pound, but was dropped after some years. It was revived by the Independent Parliament in 1782 and for some ten years brought in a substantial amount of the revenue, yielding in 1790 as much as £63,089.

BIBLIOGRAPHY.—For a discussion of absenteeism from the economic point of view *see* N. W. Senior, *Lectures on the Rate of Wages*, *Political Economy*; J. S. Mill, *Political Economy*; J. R. McCulloch, *Treatises and Essays on Money, etc.*, article "Absenteeism"; A. T. Hadley, *Economics*; on absenteeism in Ireland *see* T. Prior, *List of Absentees* (1729); A. Young, *Tour in Ireland* (1780); E. Wakefield, *Account of Ireland* (1812); *Parliamentary Papers, Ireland* (1830), vii., ditto (1845), xix–xxii.; W. E. H. Lecky, *Ireland in the 18th Century* (1892); A. E. Murray, *History of the Commercial and Financial Relations between England and Ireland* (1903); in France, A. de Monchrétien, *Traité de l'économie politique* (1615); A. de Tocqueville, *L'Ancien Régime* (1857); H. Taine, *Les Origines de la France contemporaine: l'ancien Régime* (1876).

ABSINTHE, a highly toxic liqueur or aromatized spirit, the characteristic flavouring matter of which is derived from various species of wormwood (*Artemisia absinthium*). Among the other substances generally employed in its manufacture are angelica root, sweet flag, dittany leaves, star-anise fruit, fennel and hyssop. The Swiss variety has a higher alcoholic strength than the French.

The best absinthe contains 70 to 80% of alcohol. It quickly intoxicates, and its deleterious effects are more serious than those of other forms of alcohol. The wormwood acts powerfully upon the nerve-centres, and causes delirium and hallucinations, followed in some cases by idiocy. (*See* LIQUEURS.)

ABSOLUTE. The term *absolute* is frequently used in contrast with the terms *relative*, *comparative*, *conditioned*, etc.

(a) **Absolute and Relative, Etc.**—(1) Sometimes the contrast intended is that between what expresses a relationship and what does not. In Logic, for instance, a term is described as *relative* when its function is to indicate some definite relationship in which the object named stands to some other object denoted by the correlative term. Thus *teacher* is called a relative term because it indicates the relationship in which somebody, say Socrates, stands or stood to somebody else, for instance, Plato, who is consequently designated by the correlative term *disciple*, or pupil. But a term that indicates no relationship is called *absolute*. Thus the names Socrates and Plato are called absolute terms because they do not indicate any definite relationship in which Socrates and Plato stood to each other. (2) More commonly the contrast intended is that between what a thing is *relatively* to something else (or in comparison with certain other things) and what it is in itself (that is, apart from such comparisons), or *absolutely*. In this sense one sometimes contrasts what is *relatively* or *approximately* true with what is absolutely true, or what is *comparatively* beautiful, or large, or old, etc., with what is *absolutely* so. (3) Intimately connected with the preceding distinction between *absolute* and *relative*, etc., is yet another distinction, which is perhaps the commonest of all. This is the contrast between what is subject to certain reservations or conditions and what is not subject to conditions or reservations. Thus, for example, *relative* success may mean success under certain difficult circumstances, while *absolute* success would mean complete success, without any reservations. In this way *absolute* monarchy means monarchical government not subject to any conditions or reservations, whereas *constitutional* monarchy means monarchical government subject to certain reservations or restrictions formulated in the constitution of the country. Similarly a system of ethics conceived to be valid for all times under all conditions would be described (by H. Spencer, for instance) as *absolute*, whereas a system of ethics conceived to be valid only under certain conditions of time, place or circumstance, would be called *relative*, or local, or temporary, etc. (4) The foregoing distinction naturally leads to yet another distinction; namely, that between that which is conditioned by, or dependent on, something else and that which is independent of, or unconditioned by, anything else. In philosophy, *absolute* frequently means "independent" or "unconditioned." When certain philosophers speak of "absolute truth," or of "absolute value," they mean that there are truths, or values, as the case may be, that are objective, independent or self-dependent, and not relative to, or dependent upon, individual thinkers or seekers.

(b) **The Absolute.**—This term owes its great vogue in recent times mainly to the German Idealists (Fichte, Schelling, Hegel, etc.) and their followers. But the main idea which it expresses is already found in Plato; and both the idea and the term were familiar to Thomas Aquinas, Giordano Bruno, Benedict Spinoza, and many others, long before the period of German Idealism. The use of the term is intimately connected with the last of the above-mentioned applications of the term *absolute* (4). Spinoza describes substance (that is, Nature, God or the Universe) as *absolutely* infinite, in contrast with its ultimate attributes, which are infinite each *in its kind* only; and absolutely infinite substance is conceived by Spinoza as the self-existing, independent, unconditional ground of all that is. It is the ultimate ground of all reality that is always, or nearly always, meant by the *Absolute*. But different systems of philosophy hold out different views as regards both the reality and the nature of the absolute. In Vaihinger's *Philosophy of "As If,"* the *Absolute* is a fiction. For Hamilton, Mansel and Spencer the *Absolute* is the *Unknown*; for Kant the *Absolute* (or *Noumenon*) is even *Unknowable*. Theists identify the *Absolute* with God; pantheists, with the Universe;

Schopenhauer and Wundt, with Will; Bergson, with a Life-force characterized by creative evolution; Fechner and Lipps, with Consciousness; Bradley, with Experience; Joel, with the Potentiality of all that is real; Lotze and Royce, with self-conscious Personality; Alexander, presumably with the Space-time matrix of all reality. Hegel, whose philosophy is most intimately connected with the conception of the Absolute, identified it with the Universal Spirit, which by a process of logical or dialectical development takes on one predicate after another until it manifests itself as an objective world in perfect harmony with reason.

BIBLIOGRAPHY.—Histories of Philosophy by Erdmann, Windelband, etc.; the works of Hegel, Bradley and the other philosophers referred to in the text. (A. Wo.)

ABSOLUTE DIFFERENTIAL CALCULUS: see TENSOR ANALYSIS.

ABSOLUTE MUSIC, a term applied to music of a purely abstract type, devoid of any non-musical or extra-musical significance, as distinguished from that of the pictorial or descriptive kind known as "programme music" (*q.v.*).

ABSOLUTE TEMPERATURE SCALE, the scale of temperature based on thermodynamics (*q.v.*), also called the *Kelvin Scale* after Lord Kelvin (*q.v.*). The temperature scale derived from the law of expansion of a *perfect gas* (*q.v.*), is identical with this thermodynamical scale. The usual abbreviations for absolute scale are abs., A, or K. Comparing it (approximately) with the centigrade scale (*q.v.*), $0^{\circ}\text{C} = 273^{\circ}\text{A}$, $100^{\circ}\text{C} = 373^{\circ}\text{A}$, thus *absolute zero* is equivalent to -273°C . (See THERMODYNAMICS and THERMOMETRY.)

ABSOLUTE UNITS, units of measurement of a physical quantity in terms of the fundamental units of length, mass and time; the British Association selected, as their fundamental units, the centimetre, the gramme, and the second of mean solar time, and thus formed the C.G.S. system of units. (See UNITS, DIMENSIONS OF; and PHYSICAL UNITS.)

ABSOLUTION (religious) denotes the setting of the penitent sinner free from the guilt of his sin, or from the ecclesiastical penalty (excommunication), or from both. The authority of the church or its minister to pronounce or refuse forgiveness is implied in II. Cor. ii. 5-11, and Acts v. 1-9 (*cf.* James v. 15, 16), and was derived from the tradition of our Lord's teaching; see John xx. 23 (in Matt. xviii. 18, binding and loosing probably mean forbidding and allowing). In primitive times, when confession of sins was made before the congregation, the absolution was deferred till the penance was completed; and there is no record of the use of any special formula. The penitent was reconciled by imposition of hands by the bishop, with or without the clergy. Later the office was usually discharged by priests, and the outward action more and more disused. It became the custom to give the absolution to penitents immediately after their confession and before the penance was performed. Until the middle ages the form of absolution after private confession was of the nature of a prayer, such as "May the Lord absolve thee"; and this is still the practice of the Greek church. But about the 13th century the Roman formula was altered, and the Council of Trent (1551) declared that the "form" and power of the absolution lay in the words *Ego te absolvo*, etc., and that the accompanying prayers are not essential to it. Of the three forms of absolution in the Anglican Prayer Book, that in the Visitation of the Sick (disused in the church of Ireland and in the United States) runs "I absolve thee," tracing the authority so to act through the church up to Christ: the form in the Communion Service is precatory, while that in Morning and Evening Prayer is indicative indeed, but so general as not to imply a decree of absolution. (W. O. B.)

In civil law absolution signifies the acquittal of an accused person on the ground that the evidence has either disproved or failed to prove the charge against him. The term is now little used, except in Scottish law in the forms *assoilzie* and *absolvitor*.

ABSOLUTISM. The term *absolutism* is generally applied to any view or theory that the object under consideration (whatever it may be) is not merely conventional, or subjective, or dependent, or limited in any way, but absolute, that is real or valid in itself, or objective, or independent, or unrestricted. (See ABSOLUTE.)

(1) In *ethics*, absolutism is the view that moral distinctions are not the result of mere arbitrary commands of God, or of human conventions variable according to circumstances, but that they are intrinsically valid, and the same for all human beings, at all times, and in all places. (2) In *aesthetics*, absolutism is the view that distinctions of beauty and ugliness are not entirely dependent on the subjective feelings of the percipient mind, but that they are objective differences in things themselves, like the primary qualities of material objects. (See QUALITIES.) Absolutism maintains accordingly that aesthetic appreciation should not be regarded as merely a matter of taste about which people must agree to differ (*de gustibus non disputandum*), but that there is an objective or absolute standard of beauty by which aesthetic judgment ought to be guided. The fact that even art specialists are frequently at variance is accounted for by absolutists by the suggestion that individuals vary in their powers of apprehending aesthetic qualities just as they vary in other capacities. (3) In *political theory*, absolutism denotes a form of government in which the sovereign exercises almost complete power unrestrained by such laws and reservations as characterize what is commonly called constitutional government. Hence absolutism is sometimes used as the equivalent of *despotism*.

ABSORPTION OF LIGHT: see LIGHT.

ABSORPTION SPECTRUM, the dark lines and bands produced in another spectrum (*q.v.*) when the light responsible for the latter has passed through a substance at a lower temperature than its source. (See SPECTROSCOPY.)

ABSTEMII, a name formerly given to such persons as could not partake of the cup of the Eucharist on account of their aversion to wine (Lat. *abs*, "away from"; *temetum*, "intoxicants"). In modern times many total abstainers, holding that the use of intoxicants is to be condemned absolutely, communicate in the unfermented "juice of the grape," sometimes also alleging that the wine used by Christ and his disciples at the Last Supper was unfermented.

ABSTINENCE, the fact or habit of refraining from anything, usually from indulgence of the appetite. A "total abstainer" is one who takes the pledge to abstain from alcoholic liquor (see TEMPERANCE). Abstinence in the Christian Church, is a moderate form of fasting (*q.v.*).

"Abstinence" was also a term in economics, now fallen into disuse, applied to the postponement or sacrifice of present satisfaction for the sake of future gain. It remains true that no person will save except for the purpose of securing some future advantage for himself or for others. As Taussig puts it, "present resources will not be cancelled for future resources unless some inducement be offered." This is true equally of individual or of communal saving; thus, a Collectivist or Socialist Government could only provide capital for the prosecution of industry or for future social satisfactions by drafts upon current income, *i.e.*, by performing an act of national abstinence. (See ECONOMICS.)

ABSTRACT and **ABSTRACTION**. The term *abstract* is sometimes used as a noun to denote a summary or digest of a document. Such an *abstract* is usually obtained by selecting what is essential and omitting the rest. Speaking generally, the process of *abstraction* is usually a process of selection of some part or aspect of a complex whole, and of consequent neglect of the rest. The result of such a process of "withdrawal" (in the twofold sense of *selecting* a part and *neglecting* the rest) is commonly described as *abstract*.

In logic, *e.g.*, abstract terms are distinguished from concrete terms, the latter denote objects consisting of a whole complex of attributes and standing in various relations, whereas the former designate some quality or relation isolated or abstracted from its concrete context. For instance, "motor" and "relative" are concrete terms, whereas "motion" and "relationship" are abstract terms. But there are degrees of abstraction—the selection may be less or more restricted, and the consequent neglect more or less extensive. This may be readily seen if one passes in review such a series of terms as, say, "the horse that won the Derby in 1927," "race-horse," "horse," "quadruped," "animal," "life." Of these terms only the last would be called *abstract*, but really all the

terms in the series except the first are obtained by abstraction. In fact all general terms, or common nouns, are the result of abstraction. That is why some of the earlier logicians and psychologists applied the epithet *abstract* to what are now usually called general concrete terms. It is just a matter of convenience and convention that only the more abstract terms are now called *abstract*, the less abstract terms being called *general*.

In the past too much stress used to be laid on the negative side of abstraction, that is, on the mere neglect of certain parts or aspects of the concrete whole. It is now realized more fully that the process is mainly positive in character. It is a process of positive selection, not merely one of omission, though of course it involves omission. The relative stress on the positive and the negative sides of the process of abstraction really varies considerably. When the process is merely spontaneous, or not deliberate, the negative character of abstraction is probably more prominent; when it is deliberate, that is, a process of voluntary attention, the positive phase is the more marked.

Abstraction is of great importance for all real knowledge, especially for science and philosophy. The aim of all scientific knowledge is the discovery of laws expressing the relation or correlation between various aspects of reality, such as mass and gravitation, volume and pressure, or temperature and volume; and it is by processes of abstraction that these phases of reality are isolated and followed up. (A. Wo.)

ABSTRACT OF TITLE, in law, a digest or epitome of the various instruments and events under and in consequence of which the vendor or mortgagor of an estate derives his title thereto. The system of registration has much affected the necessity for this abstract being prepared or used. (See the article, CONVEYANCE.)

ABT, FRANZ (1819-1885), German composer, was born at Eilenburg, Saxony, and died at Wiesbaden. His songs and part-songs enjoyed an extraordinary vogue throughout the world in the middle of the 19th century, and are still popular. Abt was kapellmeister at Bernburg in 1841, at Zurich in the same year and at Brunswick from 1852 to 1882, when he retired to Wiesbaden.

ABU, a mountain of central India, situated within the Rajputana State of Sirohi. It is an isolated peak of the Aravalli range, being completely detached from that chain by a narrow valley 7m. across, in which flows the western Banas. It rises from the surrounding plains of Marwar like a precipitous granite island, its various points ranging from 4,000 to 5,653 feet. The elevations and platforms of the mountain are covered with elaborately sculptured shrines, temples and tombs. On the top of the hill is a small round platform containing a cavern, with a block of granite, bearing the impression of the feet of Data-Bhrigu, an incarnation of Vishnu. The two principal temples, at Dilwarra, about the middle of the mountain, are built of white marble, and are pre-eminent alike for their beauty and as typical specimens of Jain architecture in India. The more modern of the two was built by two brothers, rich merchants, between the years 1197 and 1247, and for delicacy of carving and minute beauty of detail stands almost unrivalled, even in this land of patient and lavish labour. The other was built by Vimala, a local governor, apparently about A.D. 1032; simpler and bolder in style, it is one of the oldest as well as one of the most complete examples of Jain architecture known. The principal object within the temple is a cell lighted only from the door, containing a cross-legged seated figure of the god Parswanath. The portico is composed of 48 pillars, the whole enclosed in an oblong courtyard about 140ft. by 90ft., surrounded by a double colonnade of smaller pillars, forming porticos to a range of 52 cells, each of which is occupied by an image of Parswanath. The whole interior is magnificently ornamented.

Abu is now the summer residence of the governor-general's agent for Rajputana, and a place of resort for Europeans in the hot weather. The annual mean temperature is about 70°, rising to 90° in April; but the heat is never oppressive. The annual rainfall is about 68 inches.

ABU-BEKR (573-634), the name ("Father of the virgin") of the first of the Mohammedan caliphs (see CALIPH). He was

originally called Abd-el-Ka'ba ("servant of the temple"), and received the name by which he is known historically in consequence of the marriage of his virgin daughter Ayesha to Mohammed. He was born at Mecca A.D. 573, a Koreishite of the tribe of Beni-Taim. Possessed of immense wealth, which he had himself acquired in commerce, and held in high esteem as a judge, an interpreter of dreams and a depository of the traditions of his race, his early accession to Islamism was a fact of great importance. On his conversion he assumed the name of Abd-Alla ("servant of God"). His firm belief in Mohammed and his doctrines won for him the title El Siddik ("the faithful"). In his personal relationship to the prophet he showed the deepest veneration and the most unswerving devotion. When Mohammed fled from Mecca, Abu-Bekr was his sole companion, and shared both his hardships and his triumphs, remaining constantly with him until the day of his death. During his last illness the prophet indicated Abu-Bekr as his successor by desiring him to offer up prayer for the people. The choice was ratified by the chiefs of the army, and ultimately confirmed, though it was disputed by Ali, Mohammed's son-in-law. After a time Ali submitted, but the difference gave rise to the controversy which still divides Muslims, Sunnites and Shiites.

Abu-Bekr had scarcely assumed his new position (632), under the title Kalifat-Rasul-illah ("successor of the prophet of God"), when he was called to suppress the revolt of the tribes Hejāz and Nejd, of which the former rejected Islamism and the latter refused to pay tribute. He encountered formidable opposition from different quarters, but in every case he was successful, the severest struggle being that with the impostor Mosallima, who was finally defeated by Khalid at the battle of Akraha. When Arabia had been completely subdued, he turned to foreign conquests. The Iraq of Persia was overcome by Khalid in a single campaign, and there was also a successful expedition into Syria. After the hard-won victory over Mosallima, Omar, fearing that the sayings of the prophet would be entirely forgotten when those who had listened to them had all been removed by death, induced Abu-Bekr to see to their preservation in a written form. The record, when completed, was deposited with Hafsa, daughter of Omar, and one of the wives of Mohammed. It was held in great reverence by all Muslims, though it did not possess canonical authority, and furnished most of the materials out of which the Koran, as it now exists, was prepared. When the authoritative version was completed all copies of Hafsa's record were destroyed, in order to prevent possible disputes and divisions. Abu-Bekr died Aug. 23, 634. Shortly before his death, which one tradition ascribes to poison, another to natural causes, he indicated Omar as his successor, after the manner Mohammed had observed in his own case.

BIBLIOGRAPHY.—See CALIPHATE. W. Muir, *Annals of the early Caliphate from original sources* (1883); H. Lammens, *Le triumvirat d'Abou Bekr, Omar et Abou 'Obaida* (Beirut, 1910).

ABU HAMED, a town of the Anglo-Egyptian Sudan on the right bank of the Nile, 345m. by rail north of Khartum, and near the head of the fourth cataract. It stands at the centre of the great S-shaped bend of the Nile, and from it the railway to Wadi Halfa strikes straight across the Nubian desert, a little west of the old caravan route to Korosko. A branch railway, 138m. long from Abu Hamed, goes down the right bank of the Nile to Kareima in the Dongola *mudiriya*. The town is named after a celebrated sheikh buried here, by whose tomb travellers crossing the desert used formerly to deposit all superfluous goods, the sanctity of the saint's tomb ensuring their safety. During the advance on Khartum in 1897, a sharp action was fought here, the troops under Gen. Hunter routing the Dervishes (Aug. 7, 1897).

ABŪ HANĪFA AN-NU'MAN IBN THABIT, Mohammedan canon lawyer, was born at Kufa in A.H. 80 (A.D. 699) of non-Arab and probably Persian parentage. Few events of his life are known to us with any certainty. He was a rich silk-dealer, lectured at Kufa upon canon law (*fiqh*) and was a consulting lawyer (*mufti*), but refused steadily to take any public post. When al-Mansūr, however, was building Baghdad (145-149) Abū Hanīfa was one of the four overseers whom he appointed over the crafts-

men. In A.H. 150 (A.D. 767) he died there. A persistent but apparently later tradition asserts that he died in prison after a severe beating, because he refused to obey al-Mansūr's command to act as a judge (*cadi*, *qādi*). This was to avoid a responsibility for which he felt unfit—a frequent attitude of more pious Muslims.

For many personal anecdotes see de Slane's transl. of Ibn Khallikan iii. 555 ff., iv. 272 ff. He was buried in eastern Baghdad, where his tomb still exists, one of the few surviving sites from the time of al-Mansūr, the founder.

See C. Brockelmann, *Geschichte*, i. 169 ff.; Nawawi's *Biogr. Dict.* pp. 698-770; Ibn Hajar al-Haitami's *Biography*, publ. Cairo, A.H. 1304; legal bibliography under MOHAMMEDAN LAW.

ABU KLEA, a halting-place for caravans in the Bayuda desert, Anglo-Egyptian Sudan. It is on the road from Merawi to Metemma and 20m. north of the Nile at the last-mentioned place. Near this spot, on Jan. 17, 1885, a British force marching to the relief of Gen. Gordon at Khartum was attacked by a greatly superior force of Mahdists, who were repulsed. On the 19th, when the British force was nearer Metemma, the Mahdists renewed the attack, again unsuccessfully. Sir Herbert Stewart, the commander of the British force, was mortally wounded on the 19th, and among the killed on the 17th was Col. F. G. Burnaby.

ABU-L-ĀLA UL-MA'ARRI (973-1057), Arabian poet and letter-writer, belonged to the South Arabian tribe Tanukh, a part of which had migrated to Syria before the time of Islam. He was born in 973 at Ma'arrat un-Nu'mān in Syria. In 1007 he visited Baghdad, where he was admitted to literary circles, recited in the academies and mosques, and made the acquaintance of men to whom he addressed some of his letters later. In 1009 he returned to Ma'arra, where he spent the rest of his life in teaching and writing.

Of his works the chief are two collections of his poetry and two of his letters. The earlier poems up to 1029 have been published in Bulaq (1869), Beirut (1884) and Cairo (1886), under the title of *Saqt uz-Zand*. The poems of the second collection, known as the *Luzūm ma lam yalzam*, or the *Luzūmiyyāt*, are written with the difficult rhyme in two consonants instead of one, and contain the more original, mature, and somewhat pessimistic thoughts of the author on mutability, virtue, death, etc. They have been published in Bombay (1886) and Cairo (1889).

BIBLIOGRAPHY.—The letters on various literary and social subjects were published with commentary by Shain Effendi in Beirut (1894), and with English translation, etc., by Prof. D. S. Margoliouth in Oxford (1898). A second collection of letters, known as the *Risālat-ul-Ghufrān*, was summarized and partially translated by R. A. Nicholson in the *Journal of the Royal Asiatic Society* (1900, pp. 637 ff.; 1902, pp. 75 ff., 337 ff., 813 ff.). C. Rieu, *De Abu-l-'Alae Poetae Arabici vita et carminibus* (Bonn, 1843); A. von Kremer, *Über die philosophischen Gedichte des Abu-l-'Ala* (Vienna, 1888); cf. also the same writer's articles in the *Zeitschrift der deutschen morgenländischen Gesellschaft* (vols. xxix., xxx., xxxi. and xxxviii.). Some of his poems are translated by H. Baerlein in the *Diwan of Abu-l-'Ala* ("The Wisdom of the East" Series, 1908). For his life see the introduction to D. S. Margoliouth's edition of the letters, supplemented by the same writer's articles "Abu-l-'Ala al-Ma'arri's Correspondence on Vegetarianism" in the *Journal of the Royal Asiatic Society* (1902, pp. 289 ff.).

ABU-L-ĀTAHIYA (Abū Ishāq Ismā'il ibn Qāsim al-'Anazī) (748-828), Arabian poet, was born at 'Ain ut-Tamar in the Hejāz near Medina. His ancestors were of the tribe of 'Anaza. His life was spent in Kufa and in Baghdad, where he died in 828 in the reign of al-Ma'mūn. The poetry of Abū-l-'Ātahiya is notable for its avoidance of the artificiality almost universal in his days. The older poetry of the desert had been constantly imitated up to this time, although it was not natural to town life. Abū-l-'Ātahiya was one of the first to drop the old qasīda (elegy) form. He is one of the earliest philosophic poets of the Arabs. Much of his poetry is concerned with the observation of common life and morality, and at times is pessimistic. Naturally, in the circumstances, he was strongly suspected of heresy.

His poems (*Diwān*) with life from Arabian sources have been published at the Jesuit Press in Beirut (1887, 2nd ed. 1888). On his position in Arabic literature see W. Ahlwardt, *Diwān des Abu Nowas* pp. 21 et seq. (Greifswald, 1861); A. von Kremer, *Culturgeschichte des Orients*, vol. ii. pp. 372 ff. (Wien, 1877).

ABULFARAJ (Abū-l-Faraj 'Alī ibn ul-Husain ul-Isfahānī) (897-967), Arabian scholar, was a member of the tribe of the Quraish (Koreish) and a direct descendant of Marwān, the last of the Omayyad caliphs. He was thus connected with the Omayyad rulers in Spain, and seems to have kept up a correspondence with them and to have sent them some of his works. He was born in Isfahān, but spent his youth and made his early studies in Baghdad. He became famous for his knowledge of early Arabian antiquities. His later life was spent in various parts of the Muslim world, in Aleppo with Saif-ud-Daula (to whom he dedicated the *Book of Songs*), in Rai with the Buyid vizier ibn 'Abbād and elsewhere. In his last years he lost his reason. In religion he was a Shi'ite. Although he wrote poetry, also an anthology of verses on the monasteries of Mesopotamia and Egypt, and a genealogical work, his fame rests upon his *Book of Songs* (*Kitāb-ul-Aghāni*), which gives an account of the chief Arabian songs, ancient and modern, with the stories of the composers and singers. It contains a mass of information as to the life and customs of the early Arabs, and is the most valuable authority we have for their pre-Islamic and early Muslim days. A part of the *Book of Songs* was published by J. G. L. Kosegarten with Latin translation (Greifswald, 1840). The text was published in 20 vols. at Bulaq in 1868. Vol. xxi. was edited by R. E. Brünnow (Leyden, 1888). A volume of elaborate indices was edited by I. Guidi (Leyden, 1900), and a missing fragment of the text was published by J. Wellhausen in the *Zeitschrift der deutschen morgenländischen Gesellschaft*, vol. 50, pp. 146 ff. For his life see M'G. de Slane's translation of Ibn Khallikan's *Biographical Dictionary*, vol. ii. pp. 249 ff. (G. W. T.)

ABULFARAJ (13th century): see BAR-HEBRAEUS.

ABUL FAZL (āb-ul fahzl) (1551-1602), vizier and historiographer of the Mogul emperor, Akbar, wrote the *Akbar Nameh* or "Book of Akbar" in Persian. It consists of two parts, and is a history of Akbar's reign and the *Ain-i-Akbari*, or "Institutes" of Akbar, giving an account of the constitution, religion and administration of the empire. Akbar was murdered at the instigation of Prince Selim, afterwards Jahangir, who was jealous of the vizier's influence.

A translation of the *Ain-i-Akbari* (Calcutta, 1783-86), by Francis Gladwin, is now exceedingly rare. There is a modern translation (Calcutta, 1873, 1891, 1894): vol. i. by H. Blockmann, vols. ii. and iii. by H. S. Jarrett.

ABULFEDA (Abū-l-Fidā' Ismā'il ibn 'Alī 'Imād-ud-Dnī) (1273-1331), Arabian historian and geographer, was born at Damascus, whither his father Malik ul-Afdal, brother of the prince of Hamah, had fled from the Mongols. He was a descendant of Ayyūb, the father of Saladin. In 1285 he was present at the assault of a stronghold of the knights of St. John, and he took part in the sieges of Tripoli, Acre and Qal'at ar-Rūm. In 1298 he entered the service of the Mameluke Sultan Malik al-Nāsir and in 1310 became governor of Hamah. In 1312 he became prince with the title Malik us-Sālih, and in 1320 received the hereditary rank of sultan with the title Malik ul-Mu'ayyad. For more than twenty years altogether he reigned in tranquillity and splendour, devoting himself to the duties of government and to the composition of the works to which he is chiefly indebted for his fame. He was a munificent patron of men of letters, who came in large numbers to his court. He died in 1331.

BIBLIOGRAPHY.—His chief historical work is *An Abridgment of the History of the Human Race*, annals extending from the creation to the year 1329 (Constantinople, 1869). Various translations of parts of it exist. His *Geography* is founded on the works of his predecessors, and so ultimately on the work of Ptolemy. Parts of the work were published and translated as early as 1650 (cf. Carl Brockelmann's *Geschichte der Arabischen Litteratur*, Berlin, 1902, vol. ii. pp. 44-46). The text of the whole was published by M'G. de Slane and M. Reinaud (Paris, 1840), and a French translation with introduction by M. Reinaud and Stanislas Guyard (Paris, 1848-83).

ABU'L KASIM MANSUR: see FIRDOUSI.

ABŪ-L-QĀSIM [Khalaf ibn 'Abbās uz-Zahrāwī], Arabian physician and surgeon, generally known in Europe as ABULCASIS, flourished in the tenth century at Cordova as physician to the caliph 'Abdur-Rahmān III. (912-961).

A part of his compendium of medicine was published in Latin as *Liber theoricæ nec non practicæ Alsaḥaravii* (Augsburg, 1519). His manual of surgery was published at Venice in 1497, at Basle in 1541, and at Oxford *Abulcasis de Chirurgia arabice et latine cura Johannis Channing* (2 vols. 1778).

For his other works see Carl Brockelmann, *Geschichte der arabischen Literatur* (Weimar, 1898), vol. i. pp. 239-240.

ABŪ 'L WAFĀ or **ALBUZDSCHANI** (940-998), Arab astronomer and mathematician, was born at Buzdschan in Khurāsān, and was one of the most learned men of his day. A passage in his *Almagest* is held by some to indicate that he had noted inequalities in the moon's motion, later described as variation. He translated and commented on the works of the Greek mathematicians, and made an exhaustive commentary on Diophantus; unfortunately these writings are lost. The existing book in 12 chapters of geometrical constructions in a Persian translation is not his, but appears to be derived from an account of his lectures drawn up by one of his pupils. Abū 'l Wafā introduced the trigonometrical functions and constructed tables of tangents and co-tangents.

See Woepcke in *Journal Asiatique*, Feb. and March, 1855.

ABUNDANTIA, Roman goddess, the personification of prosperity and good fortune. On the coins of the later Roman emperors she is frequently represented holding a horn of plenty and distributing grain and money. She may be compared with Domina Abundia (O. Fr. *Dame Habonde, Notre Dame d'Abondance*), a beneficent fairy, who brought plenty to those whom she visited (Grimm, *Teutonic Mythology*, i. 286-7).

ABU NUWAS (Abū 'Alī Hal-asan ibn Hānī'al-Hakamī) (c. 756-810), Arabian poet, was born in al-Ahwāz, probably about 756. His mother was a Persian, his father a soldier, a native of Damascus. He is said to have spent a year with the Arabs in the desert to gain purity of language. Settling in Baghdad he enjoyed the favour of Harūn al-Rashīd and al-Amin, and died there, probably about 810. Abū Nuwās is recognized as the greatest Arab poet of his time. Genial, cynical, immoral, he drew on all the varied life of his time for the material of his poems. In his wine-songs especially the manners of the upper classes of Baghdad are revealed. He was one of the first to ridicule the set form of the *qasīda* (elegy) as unnatural, and has satirized this form in several poems.

See I. Goldziher, *Abhandlungen zur Arabischen Philologie* (Leyden, 1896), i. pp. 145 ff. His poems were collected by several Arabian editors. One such collection (the MS. of which is now in Vienna) contains nearly 5,000 verses. His collected poems (*Diwān*) have been published in Cairo (1860), in Beirut (1884) and an edition by Isma'īl al-Nabhānī (Cairo, 1904). The wine-songs were edited by W. Ahlwardt under the title *Diwān des Abu Nowas. i. Die Weinlieder* (Greifswald, 1861).

ABU SIMBEL or **IPSAMBUL**, the name of a group of temples of Rameses II. (c. 1250 B.C.) in Nubia, on the left bank of the Nile, 56m. by river south of Korosko. They are hewn in the sandstone cliffs at the riverside, and are three in number. The principal temple, begun by Seti and completed by his son, is probably the greatest and most imposing of all rock-hewn monuments. It was discovered by Burckhardt in 1812 and opened by Belzoni in 1817; the front has been cleared several times, but the sand is always pressing forward from the north end. The hillside was recessed to form the façade, backed against which four immense seated colossi of the king, in pairs on either side of the entrance, rise from a platform or forecourt reached from the river by a flight of steps. The colossi are 65ft. in height, of nobly placid design, and are accompanied by smaller figures of Rameses' queen and their sons and daughters; behind and over them is the cornice, with the dedication below a long row of apes, standing in adoration of the rising sun. The temple is dedicated primarily to the solar gods Amenra of Thebes and Raharakht of Heliopolis, the true sun god; it is oriented to the east so that the rays of the sun in the early morning penetrate the whole length of two great halls to the innermost sanctuary and fall upon the central figures of Amenra and Rameses, which are there enthroned with Ptah of Memphis and Raharakht on either side. The interior of the temple consists of a series of halls, penetrating for 185ft. into the

solid rock and decorated with coloured sculpture of fine workmanship and in good preservation; some of the scenes are of religious import (amongst them Rameses as king making offerings to himself as god), others illustrate war in Syria, Libya and Ethiopia; another series depicts the events of the famous battle with the Hittites and their allies at Kadesh, in which Rameses saved the Egyptian camp and army by his personal valour. Not the least important feature of the temple belongs to a later age when some

THE COLOSSAL STATUES OF RAMESSES II. AT ABU SIMBEL ARE 65FT. HIGH AND ARE ACCOMPANIED BY SMALLER STATUES OF THE MEMBERS OF HIS FAMILY

Greek, Carian and Phoenician soldiers of one of the kings named Psammetichus (apparently Psammetichus II., 594-589 B.C.) inscribed their names upon the two southern colossi, doubtless the only ones then clear of sand. These graffiti are of the highest value for the early history of the alphabet, and as proving the presence of Greek mercenaries in the Egyptian armies of the period. The upper part of the second colossus (from the south) has fallen; the third was repaired by Sethos II. not many years after the completion of the temple. A small temple, immediately to the south of the first, is believed to have had a built antechamber: it is the earliest known example of a "birth chapel," such as was usually attached to Ptolemaic temples for the accommodation of the divine mother-consort and her son. The third and northernmost temple, separated from the others by a ravine, is on a large scale; the colossi of the façade are six in number and 33ft. high, representing Rameses and his queen Nefrêre, who dedicated the temple to the goddess Hathôr.

ABŪ TAMMĀM (Habīb ibn Aus) (807-846), Arabian poet, was born in Jāsim (Jesem), a place to the north-east of the Sea of Tiberias or near Manbij (Hierapolis). He died in Mosul. Abū Tammām is best known as the compiler of the collection of early poems known as the *Hamāsa* (q.v.). Two other collections of a similar nature are ascribed to him. His own poems have been somewhat neglected owing to the success of his compilations. His poems (*Diwān*) were published in Cairo (A.D. 1875).

See Life in Ibn Khallikan's *Biographical Dictionary*, trans. by M'G. de Slane (Paris and London, 1842), vol. i. pp. 348 ff.; and in the *Kitāb ul-Aghānī* (Book of Songs) of Abulfaraj (Bulaq, 1869), vol. xv. pp. 100-108, also D. S. Margoliouth, "Indices to the Diwan of Abu Tammam" in the *Journal of the Royal Asiatic Society* (1905).

ABUTILON (from the Arabic *aubūtīlūn*, a name given by Avicenna to this or an allied genus), in botany, a genus of plants of the family Malvaceae (mallows), having about 120 species, and widely distributed in the tropics. They are free-growing shrubs with showy bell-shaped flowers, and are favourite greenhouse plants. They may be grown outside in England during the summer months, but a few degrees of frost is fatal to them. They are readily propagated from cuttings taken in the spring or at the end of the summer. Many varieties have been developed by hybridization, some of which have a variegated foliage.

ABUTMENT, a construction in masonry designed to receive and resist the lateral pressure of an arch, vault or strut. When part of a wall it is termed a buttress (q.v.).

ABU UBAIDA (Ma'mar ibn ul-Muthannal) (728-825), Arabian scholar, was born a slave of Jewish-Persian parents in Basra. In 803 he was called to Baghdad by Harūn al-Rashīd. He died in Basra. He was one of the most learned and authoritative scholars of his time in the Arabic language, antiquities and stories. The titles of 105 of his works are mentioned in the *Fihrist*, and his *Book of Days* is the basis of parts of the history of ibn al-Athīr and of the *Book of Songs*, but nothing of his (except a song) seems to exist now in an independent form.

BIBLIOGRAPHY.—See *Life* in ibn Khallikān's *Biographical Dictionary*, trans. by M'G. de Slane (1842), vol. iii., pp. 388-398; also I. Goldziher's *Muhammedanische Studien* (Halle, 1888), vol. i., pp. 194-206.

ABYDOS, ancient town of Mysia, Asia Minor, on the Hellespont, here scarcely a mile broad. Probably originally a Thracian town, it was afterwards colonized by Milesians. Here Xerxes crossed the strait on his bridge of boats when he invaded Greece. Abydos is celebrated for its vigorous resistance to Philip V. of Macedon (200 B.C.), and is famed in story for the loves of Hero and Leander. Until late Byzantine times the toll station of the Hellespont, its importance was transferred to the Dardanelles (q.v.), after the building of the "Old Castles" by Sultan Mohammed II. (c. 1456).

ABYDOS, one of the most ancient cities of Upper Egypt, about 7m. west of the Nile in lat. 26° 10' N. (railway station Al-Baliana). The Egyptian name was *Abdu*, "the hill of the symbol or reliquary" in which the sacred head of Osiris was preserved. Thence the Greeks named it Abydos, like the city on the Hellespont; the modern Arabic name is *Arabet el Madfuneh*. The history of the city begins in the late prehistoric age, it having been founded by the pre-Menite kings whose town, temple and tombs have been found there. The kings of the 1st dynasty, and some of the 2nd dynasty, were also buried here, and the temple was renewed and enlarged by them. Great forts were built on the desert behind the town by three kings of the 2nd dynasty. The temple and town continued to be rebuilt at intervals down to the times of the 30th dynasty, and the cemetery was used continuously. In the 12th dynasty a gigantic tomb was cut in the rock by Senusri (or Senusert) III. Seti I. in the 19th dynasty founded a great new temple to the south of the town in honour of the ancestral kings of the early dynasties; this was finished by Rameses II., who also built a lesser temple of his own. Mineptah added a great Hypogeum of Osiris to the temple of Seti. The latest building was a new temple of Nekhtnebt in the 30th dynasty.

The worship here was of the jackal god Upuaut (Ophōis, Wepwōi), who "opened the way" to the realm of the dead, increasing from the 1st dynasty to the time of the 12th dynasty and then disappearing after the 18th. Anher appears in the 11th dynasty; and Khentamenti, the god of the western Hades, rises to importance in the middle kingdom and then vanishes in the 18th. The worship here of Osiris in his various forms begins in the 12th dynasty and becomes more important in later times, so that at last the whole place was considered as sacred to him.

The temples successively built here on one site were nine or ten in number, from the 1st dynasty, to the 26th dynasty (500 B.C.). The first was an enclosure, about 30 x 50ft., surrounded by a thin wall of unbaked bricks. Covering one wall of this came the second temple of about 40ft. square in a wall about 10ft. thick. An outer *temenos* (enclosure) wall surrounded the ground. This outer wall was thickened about the 2nd or 3rd dynasty. The old temple entirely vanished in the 4th dynasty, and a smaller building was erected behind it, enclosing a wide hearth of black ashes. Pottery models of offerings are found in the ashes, and these were probably the substitutes for sacrifices decreed by Cheops (Khufu) in his temple reforms. A great clearance of temple offerings was made now, or earlier, and a chamber full of them has yielded the fine ivory carvings and the glazed figures and tiles which show the splendid work of the 1st dynasty. A vase of Menes with purple inlaid hieroglyphs in green glaze and the tiles with relief figures are the most important pieces. The noble statuette of Cheops in ivory, found in the stone chamber of the temple, gives the only portrait of this ruler. The temple was rebuilt entirely on a larger scale by Pepi I. in the 6th dynasty. He placed a great stone gateway to the *temenos*, an outer *temenos* wall and gateway, with a colonnade between the gates. His temple was about 40 x 50ft. inside, with stone gateways front and back, showing that it was of the processional type. In the 11th dynasty Menthopt (Mentuhotep) III. added a colonnade and altars. Soon after, Sankhkerē entirely rebuilt the temple, laying a stone pavement over the area, about 45ft. square, besides subsidiary chambers. Soon after Senusri (Senusert) I. in the 12th dynasty laid massive foundations of stone over the pavement of his predecessor.

A great *temenos* was laid out enclosing a much larger area, and the temple itself was about three times the earlier size.

The 18th dynasty began with a large chapel of Amasis I., and then Thothmes III. built a far larger temple, about 130 x 200ft. He made also a processional way past the side of the temple to the cemetery beyond, with a great gateway of granite. Rameses III. added a large building; and Amasis II. in the 26th dynasty rebuilt the temple again, and placed in it a large monolith shrine of red granite, finely wrought. The foundations of the successive temples were comprised within about 18ft. depth of ruins.

The temple of Seti I. was built on entirely new ground half a mile to the south of the long series of temples just described. This is the building best known as the Great Temple of Abydos, being nearly complete and an impressive sight. The long list of the kings of the principal dynasties carved on a wall is known as the "Table of Abydos." There were also seven chapels for the worship of the king and principal gods. The temple was originally 550ft. long, but the forecourts are scarcely recognizable, and the part in good state is about 250ft. long and 350ft. wide, including the wing at the side. Excepting the list of kings and a panegyric on Rameses II., the subjects are not historical but mythological. The adjacent temple of Rameses II. was much smaller and simpler in plan; but it had a fine historical series of scenes around the outside, of which the lower parts remain. A list of kings, similar to that of Seti, formerly stood here; but the fragments were sold by the French consul to the British Museum.

The royal tombs of the earliest dynasties were placed about a mile back on the great desert plain. The earliest is about 10 x 20ft. inside, a pit lined with brick walls, and originally roofed with timber and matting. Others also before Menes are 15 x 25ft. The tomb probably of Menes is of the latter size. After this the tombs increase in size and complexity. The tomb-pit is surrounded by chambers to hold the offerings, the actual sepulchre being a great wooden chamber in the midst of the brick-lined pit. Rows of small tomb-pits for the servants of the king surround the royal chamber, many dozens of such burials being usual. By the end of the 2nd dynasty the type changed to a long passage bordered with chambers on either hand, the royal burial being in the middle of the length. The greatest of these tombs with its dependencies covered a space of over 3,000sq. yards. The contents of the tombs have been nearly destroyed by successive plunderers; enough remained to show that rich jewellery was placed on the mummies, a profusion of vases of hard and valuable stones from the royal table service stood about the body, the store-rooms were filled with great jars of wine, perfumed ointment and other supplies, and tablets of ivory and ebony were engraved with a record of the yearly annals of the reigns.

The cemetery of private persons begins in the 1st dynasty with some pit tombs in the town. It was extensive in the 12th and 13th dynasties and contained many rich tombs. In the 18th-20th dynasties a large number of fine tombs were made, and later ages continued to bury here till Roman times.

The forts lay behind the town. That known as Shunet ez Zebib is about 450 x 250ft. over all, and still stands 30ft. high. It was built by Khasekhemui, the last king of the 2nd dynasty. Another fort nearly as large adjoined it, and is probably rather older. A third fort of a squarer form is now occupied by the Coptic convent; its age cannot be ascertained.

Jean Capart, *Abydos: Le Temple de Seti I.* (Bruxelles, 1912); *The Cemeteries of Abydos*, 3 vols. (Egypt Exploration Fund, 1913-14).

ABYSS, any deep place (Gr. *ἀ-*, privative, *βυσσός*, bottom), a bottomless depth. From the late popular *abyssimus* (superlative of Low Latin *abyssus*) through the French *abisme* (i.e., *abîme*) is derived the poetic form *abysm*, pronounced as late as 1616 to rhyme with *time*. The adjective "abyssal" or "abysmal" has been used by zoologists to describe deep regions of the sea. In heraldry the abyss is the middle of an escutcheon. In the Greek version of the Old Testament the word represents (1) the original chaos (Gen. i. 2), (2) the Hebrew *tehom*, which is used also in apocalyptic literature and in the New Testament for hell. In the Septuagint cosmography the word is applied (a) to the waters under the earth, and (b) to the waters of the firmament

which were regarded as closely connected with those below. Derivatively it acquired the meaning of the place of the dead. In *Revelation* it is the prison of evil spirits whence they may occasionally be let loose, and where Satan is doomed to spend 1,000 years. In rabbinical cosmography the abyss is a region of Gehenna situated below the ocean bed and divided into three or seven parts imposed one above the other. In the Kabbalah the abyss as the opening into the lower world is the abode of evil spirits, and corresponds to the opening of the abyss to the world above. In general, the abyss is regarded vaguely as a place of indefinite extent, the abode of mystery and sorrow.

ABYSSINIA (officially Ethiopia), an inland country and empire of North-east Africa lying, chiefly, between 5° and 15° N. and 35° and 42° E. It is bounded on the north by Eritrea (Italian), on the west by the Anglo-Egyptian Sudan, on the south-west and south by Uganda and Kenya, on the south-east and east by British, Italian and French Somaliland. The coast lands in European hands, which cut off Abyssinia from access to the sea, vary in width from 40 to 250 miles and are narrowest on the north-east border near the Red Sea. Abyssinia in the north is 230m. east to west, but is 900m. wide along latitude 9° N., and resembles a triangle with apex north. It is divided into Abyssinia proper (*i.e.*, the old Ethiopian empire consisting of Tigré, Amhara, Gojam and part of Shoa) with the south-west Galla highlands and the remainder of Shoa all forming a geographical unit—and cut off from it by the great Rift valley—and the Somaliland plateau with Harar: nearly all this country being surrounded by tracts of low-lying desert. The area of the whole State is about 350,000sq.m., of which Abyssinian Somaliland covers between a quarter and a third.

PHYSICAL FEATURES

Between the Upper Nile and the low south-west shores of the Red Sea and the Gulf of Aden lie elevated plateaux with mountain ranges. The plateaux rise abruptly from the plains, constituting outer mountain chains. The Abyssinian highlands are thus a clearly marked orographic division. From Ras Kasar (18°N.) to Annesley Bay (15°N.) the eastern wall of the plateau runs parallel to the Red Sea. It then turns due south and follows closely the line of 40°E. for some 400m. About 9°N. the River Hawash flows east through the opening of the Rift valley. The main range at this point trends south-west, while south of the Hawash valley, which is some 3,000ft. below the level of the mountains, another massif rises in a direct line south. The second range sends a chain (the Harar Hills) east to the Gulf of Aden. The two chief eastern ranges run parallel south by west on either side of the Rift valley—in which are a series of lakes—to about 3°N., the outer (eastern) spurs of the plateau still keeping along the line of 40°E. The southern escarpment of the plateau is highly irregular, but has a general direction north-west and south-east from 6°N. to 3°N. The western wall of the plateau, from 6°N. to 11°N., is precipitous. North of 11°N. the hills turn more to the east, and fall more gradually to the plains at their base. On its northern face also the plateau falls in terraces to the level of the eastern Sudan. The eastern escarpment has a mean height of 7,000 to 8,000ft., and is often precipitous. Torrents descend narrow deep clefts to lose themselves in the sandy coast land; they afford means of reaching the plateau, as alternatives to the easier route through the Hawash valley. On surmounting this rocky barrier the traveller finds that the encircling rampart rises little above the normal level of the plateau. The northern highlands, mainly 10° to 15°N., consist of Archaean rocks of mean height 7,000 to 7,500ft., and a deep central depression contains Lake Tana. Above the plateau mountain ranges rise to 12,000 and over 15,000ft., with fantastic forms, and cut by enormous fissures due to erosion; some are wider, others have the opposite walls but 200 or 300yd. apart, and fall almost vertically thousands of feet. Numerous isolated flat-topped hills or small plateaux known as *ambas*, are left. The highest peaks are in the Simen (or Semien) ranges, north-east of Lake Tana, which culminate in a snow-covered peak, Dajan (15,160ft.). Parallel with the eastern escarpment the heights rise to Mt. Kollo (14,100ft.)

south-west of Magdala. The valley between these hills and the eastern escarpment is one of the largest and most profound chasms in Abyssinia. Between Lake Tana and the eastern hills are Mounts Guna (13,800ft.) and Uara Sahia (13,000ft.). The highlands south of latitude 10°N. have more open tableland than the northern portion and fewer lofty peaks, but the general character is still that of a much broken hilly plateau.

The uplands usually slope north-west and nearly all the large rivers flow to the Nile; the Takkaze in the north, the Abbai in the centre, and the Sobat in the south make up four-fifths of the entire drainage. The rest is carried off almost due north by the Khor Baraka, which occasionally reaches the Red Sea south of Suakin, by the Hawash, which runs out in the salt lake area near the head of Tajura Bay; by the Webi Shibeli and Juba, which flow south-east through Somaliland, though the Shibeli fails to reach the Indian ocean; and by the Omo, the main feeder of the closed basin of Lake Rudolf. The Takkaze, the true upper course of the Atbara, falls from about 7,000ft. in the central tableland to 2,500ft. in the tremendous crevasse through which it sweeps west, north, and west again, to the western terraces and the Sudan. During the rains the Takkaze (*i.e.*, the "Terrible") rises some 18ft. above its normal level, and at this time forms an impassable barrier between the northern and central provinces. Lower down, the river has the Arab name Setit. The Setit is joined (14° 10'N., 36°E.) by the Atbara, formed by several streams of the mountains west and north-west of Lake Tana. The Gash or Mareb is the most northerly Abyssinian river flowing towards the Nile. It rises on the landward side of the eastern escarpment within 50 miles of Annesley Bay on the Red Sea, and reaches the Sudan near Kassala to lose itself in the sandy plain. The Mareb is dry for a great part of the year, but like the Takkaze has sudden freshets during rains. Only the left bank of the upper course of the river is in Abyssinian territory, the Mareb here forming the boundary between Eritrea and Abyssinia.

The Abbai or Blue Nile has its source near Mt. Denguiza in the Gojam highlands (about 11°N. and 37°E.) and first flows for 70m. nearly due north to the south side of Lake Tana (*q.v.*), through which it runs for some 20 miles and, escaping by a deep crevasse, bends in a great semicircle, east, south and north-west, the reverse of that of the Takkaze, down to the plains of Sennar. The Abbai has many perennial tributaries, of which the principal are the Bashilo, the Jamma, the Muger, the Gudiv, the Didessa, largest of all, and the Yabus. The right-hand tributaries, rising mostly on the western sides of the plateau, have steep slopes and are generally torrential; the Bolassa is perennial, and the Rahad and the Dinder are important in flood-time.

In the mountains and plateaux of Kaffa and Galla in south-west Abyssinia rise the chief affluents of the Sobat tributary of the Nile. The Akobo joins the Pibor, which unites with the Baro to form the Sobat. These rivers (which form for 250m. the west or south-west frontiers of Abyssinia) descend in great falls, and like other Abyssinian streams are unnavigable in their upper courses. The Baro on reaching the plain affords, however, an open waterway to the Nile (*see* NILE, SOBAT, and SUDAN).

The chief eastward river is the Hawash, rising in the Shoa uplands and bending first south-east and then north-east. It reaches the Afar (Danakil) lowlands through a broad breach in the eastern escarpment of the plateau, where it is nearly 200ft. wide and 4ft. deep, even in the dry season, and during the floods rises 50 or 60ft. above low-water mark, thus inundating the plains for many miles along both its banks. Yet it fails to reach the coast and after a winding course of about 500m. is lost near Lake Aussa, some 60 or 70m. from the head of Tajura Bay. From Shoa south-west to Lake Rudolf extends a chain of lovely upland lakes, some fresh, some brackish, some completely closed, others connected by short channels, the chief links in their order from north to south being:—Zwai, communicating southwards with Hora Abyata, which connects with Langana, all in the Arusi Galla territory; then Shala and Awusa; farther south Abaya (Margherita) with an outlet to a smaller tarn, Chamo, in the romantic Baroda and Gamo districts, skirted on the west by grassy slopes and wooded ranges (6,000 to nearly 9,000ft.);

DRAWN BY JOHN BARTHOLOMEW & SONS LTD., EDINBURGH

ABYSSINIA COVERS ABOUT 350,000 SQ. M., OF WHICH ABYSSINIAN SOMALILAND MAKES NEARLY A THIRD. MOST OF THE COUNTRY WEST OF 40° IS A PLATEAU FROM WHICH RISE VARIOUS MOUNTAIN RANGES. ON EVERY SIDE EXCEPT THE SOUTH THE WALLS OF THE PLATEAU RISE ABRUPTLY FROM THE PLAINS. IN A DAY'S JOURNEY THE TRAVELLER MAY PASS FROM TROPICAL TO ALMOST ALPINE CONDITIONS OF CLIMATE. EQUALLY GREAT IS THE RANGE OF THE FLORA AND FAUNA. THERE ARE FEW LARGE TOWNS

lastly, in the Asille country, Lake Stefanie, the Chuwaha of the natives, completely closed and about 1,800ft. above sea. To the same system obviously belongs the neighbouring Lake Rudolf (*q.v.*), larger than all the rest together. This lake receives at its northern end (1,800ft. above sea level) the waters of the Omo, a rapid and unnavigable perennial stream with many affluents, rising in the Shoa highlands and falling 6,000ft. in its course of 370m. The chief rivers of Somaliland (*q.v.*), Webi Shibeli and Juba (*q.v.*), rise on the south-eastern slopes of the Abyssinian escarpment and most of their course is through Abyssinian territory.

GEOLOGY

The East African tableland is continued into Abyssinia, the following formations being represented:—

Archæan.—Metamorphic rocks, the main mass of the tableland, are exposed in every deep valley in Tigré and along the Blue Nile. Mica schists are most prevalent. Hornblende schists also occur and a compact felspathic rock in the Suris defile. The foliæ of the schists strike north and south.

Triassic (?).—In the region of Adigrat the metamorphic rocks are invariably overlain by white and brown sandstones, unfossiliferous, and attaining a maximum thickness of 1,000ft. They are overlain by the fossiliferous limestones of the Antalo group. Around Chilga and Adigrat coal-bearing beds occur, which Blanford suggests may be of the same age as the coal-bearing strata of India. The Adigrat sandstone possibly represents some portion of the Karoo formation of South Africa.

Jurassic.—The fossiliferous limestones of Antalo are generally horizontal, but much disturbed when interstratified with trap rocks. The fossils are all characteristic Oolite forms and include a species of *Hemicidaris*, *Pholadomya*, *Ceromya*, *Trigonia* and *Alaria*.

Igneous Rocks.—Above a height of 8,000ft. the country consists of bedded traps belonging to two distinct and unconformable groups. The lower (Ashangi group) consists of basalts and dolerites often amygdaloidal. Their relation to the Antalo limestones is uncertain, but Blanford considers them to be not later in age than the Oolite. The upper (Magdala group) contains

much thick trachytic rock lying perfectly horizontally, and giving rise to a series of terraced ridges characteristic of central Abyssinia. They are interbedded with unfossiliferous sandstones and shales. Of more recent date (probably Tertiary) are some igneous rocks, rich in alkalis, in parts of southern Abyssinia. Still more recent are the basalts and ashes west of Massawa and around Annesley Bay, and known as the Aden volcanic series. The older igneous rocks have suffered severe denudation, giving deep and narrow ravines, sometimes to a depth of 3,000 to 4,000ft.

Climate.—Somaliland and the Danakil lowlands are hot and dry with semi-desert conditions; the lower basin of the Sobat is hot, swampy and malarious. But over most of Abyssinia, as well as the Galla highlands, the climate is very healthy and temperate. The country lies wholly within the tropics, but its nearness to the equator is counterbalanced by the elevation of the land. In the deep valley of the Takazze and Abbai, and generally below 4,000ft., conditions are torrid and fevers prevalent. On the uplands, however, the air is bracing and the nights very bleak. The mean range of temperature is between 60° and 80°. On the higher mountains the climate is Alpine. The atmosphere on the plateaus is exceedingly clear. In addition to variation in climate with elevation, the year may be divided into two main seasons, the dry (*baga*) from Oct. to mid-June, and the rainy (*karamt*), caused by the south-west monsoon, from mid-June to the end of September. There is also a period of so-called "little rains," generally about March.

The incidence of the rains varies slightly in different parts of the country, the rain moving from north to south; the average annual rainfall at Addis Ababa over a period of 25 years amounted to 1,200mm.; it is on the whole rather lighter in the north. The rainy season is of great importance not only to Abyssinia but to the countries of the Nile valley, as the prosperity of the eastern Sudan and Egypt is largely dependent upon the Abyssinian rainfall.

Flora and Fauna.—As in a day's journey the traveller may pass from torrid to almost Alpine conditions of climate, so great also is the range of flora and fauna. In the valleys and lowlands vegetation is dense, but the plateaux are comparatively bare, with thinly scattered trees and bushes. The glens and ravines are often thickly wooded, and offer a delightful contrast to the open downs. These conditions are particularly characteristic in the north; in the south the upland vegetation is more luxuriant. The date palm, mimosa, wild olive, giant sycamores, junipers and laurels, the myrrh and other gum trees (gnarled and stunted, these flourish most on the eastern foothills), a magnificent pine (the Natal yellow pine, which resists the attacks of the white ant), the fig, orange, lime, pomegranate, peach, apricot, banana and other fruit trees; the grape vine (rare), blackberry and raspberry; the cotton and indigo plants, and occasionally the sugar cane, are all found. There are in the south large forests of valuable timber; and the coffee plant is indigenous in the Kaffa country, whence it takes its name. Many grasses and flowers abound. Large areas in the highlands are covered by the Kosso tree, which grows from 30 to 40ft. high and has abundant pendant red blossoms; the flowers and the leaves are prized for medicinal purposes. The fruit of the kurarina, found almost exclusively in Shoa, yields a black grain highly esteemed as a spice. On the tableland a great variety of grains and vegetables are cultivated. A fibrous plant, the sansevieria, grows wild in the semi-desert regions of the north and south-east.

Elephant and rhinoceros are found in low-lying districts, especially in the Sobat valley. The hippopotamus and crocodile inhabit many of the rivers and lakes, in some of which otters of large size are plentiful. Lions abound in the low countries and in Somaliland. Leopards, spotted and black, are numerous and often large; hyaenas are found everywhere and are hardy and fierce; lynx, wolf, wild dog and jackal are also common. Boars and badgers are more rarely seen. The giraffe is found in the west; the zebra and wild ass frequent the lower plateaux and the rocky hills of the north. Antelopes and gazelles of many varieties are numerous in most parts and include greater and lesser kudu (both rather rare), oryx, duiker, gemsbuck, hartebeest, gerenuk

(the most common—it has long thin legs and a camel-like neck), klip-springer, found on the high plateaux as well as in the lower districts, and the dik-dik, the smallest of the antelopes, rarely over 10 lb., common in the low countries and the foothills. The rarest of all these is the nyala. The civet is found in many parts but chiefly in the Galla regions. Squirrels and hares, monkeys, notably the guereza, gelada, guenon and dog-faced baboon, range abundantly from the warm lowlands to heights of 10,000ft. Eagles, vultures, hawks, bustards and other birds of prey, partridges, duck, teal, guinea-fowl, sand-grouse, curlews, woodcock, snipe, pigeons, thrushes and swallows are very plentiful. A fine variety of ostrich is common. Among birds prized for plumage are the marabout, crane, heron, blackbird, parrot, jay, and many sun-birds of extraordinary brilliance. Serpents are not numerous but several are poisonous. The bee's honey is an important part of the people's food. The locust is a pest. There are thousands of varieties of butterflies and other insects.

ADMINISTRATION AND INDUSTRY

Provinces and Towns.—The ancient provincial divisions of Abyssinia (Amhara, Tigré, Gojam, Shoa, etc.) are for the most part now mere geographical expressions, having been broken up into smaller governorships with the exception of the ancient kingdom of Gojjam, enclosed by the great bend of the Abbai, which is still a single governorship. The more important provinces number about 20, of which may be mentioned: Gojam, North and South Tigré, Bagemdir, Harar, Salale, Waag and Lasta and Jimma. Each is divided into sub-districts and further subdivided into groups of villages. With the exception of the capital, Addis Ababa (*q.v.*), Harar, and Direddawa, there are no towns of any size in Abyssinia. Centuries of almost continual warfare between the provinces help to account for the absence of large towns; also royal residences have changed frequently on exhaustion of fuel supplies. The earliest capital appears to have been Aksum (*q.v.*), in Tigré, where there are extensive ruins. Gondar in Amhara was the capital from the middle ages to the middle of the 19th century. Since 1892 the capital has been Addis Ababa in Shoa.

None of the other towns has a permanent population exceeding 6,000 to 10,000, but several have large periodic markets. In Tigré are Aduwa (17m. E. by N. of Aksum), Aksum, Adigrat, Makale and Antalo. The three last are near the eastern escarpment of the high plateau on the direct road South from Massawa to Shoa. West of Adigrat is the monastery of Debra-Damo, a most celebrated sanctuary.

In Amhara are Magdala (*q.v.*), formerly the residence of King Theodore, and the place of imprisonment of the British captives in 1866; Debra-Tabor ("Mount Tabor"), the chief royal residence under King John in a strong strategic position, overlooks the fertile plain east of Lake Tana about 8,620ft. above sea. Amba-Mariam, a fortified station midway between Gondar and Debra-Tabor near the north-east side of Lake Tana, with a population of 3,000, has the famous shrine and church dedicated to St. Mary, whence the name Mahdara-Mariam ("Mary's Rest"). It was a royal residence, and is an important market and place of pilgrimage, a few miles south-west of Debra-Tabor; Sokota, a great central market, capital of Waag, is at the convergence of several main routes. In Shoa are: Ankober, formerly the capital of the kingdom, Debra-Birhan ("Mountain of Light"), once a royal residence; Liché (Litché), one of the largest market towns in the south. Lfeka, the largest market in Gallaland, communicates direct with Gojam, Shoa and other parts of the empire. Anderacha, the commercial centre of Kaffa, and Jiren, capital of the neighbouring province of Jimma, attract traders from surrounding provinces.

Communications.—There is a single line of railway from Jibuti to Addis Ababa (780m.) but, outside the capital, there are no roads for wheeled traffic. Transport is by mules, donkeys, pack-horses and (in the lower regions) camels. Telegraph lines connect Addis Ababa and several important towns of the north with Massawa, Harar and Jibuti. There is also a telephonic

LIFE AND CUSTOMS OF THE PEOPLE OF ABYSSINIA

1. Ras Tafari, who was appointed regent at the coronation of the Empress Zauditu, Feb. 11, 1917
2. Reproduction of a picture in an Abyssinian church in which the native artist has replaced the original face of the rider by that of the regent at that time
3. Ras Tafari signing the slavery decree in 1923. This decree made slave-trading punishable by death in Abyssinia
4. Wood-sellers at Addis Abeba, the capital of Abyssinia
5. Picture of the officers of the Abyssinian army on the parade grounds at Addis Abeba. They were commanded by Ras Tafari
6. An ancient Galla stone in the Arussi country, where recent archaeological research has resulted in the discovery of numbers of dolmens
7. An Abyssinian and a Shankalla woman (negroids) grinding grain on stones
8. Abyssinian queen, wife of the actual ruler, posing for her picture in front of the palace in Addis Abeba

service, but outside Addis Ababa, the capital, it is subject to frequent interruption.

Agriculture.—The soil is exceedingly fertile and agriculture is extensively followed; in the lower regions maize, durra, wheat, barley, rye, *teff*, pease, cotton and sugar-cane are grown. *Teff*, a kind of millet with pinhead grains, is the common bread grain. The low grounds also produce a grain, *tocussa*, from which black bread is made. Certain oleaginous plants, the *suf*, *nuc* and *selite* (no European equivalents for the native names), and the ground-nut, are largely grown. The castor bean grows wild, the green castor in the low, damp regions, the red castor at medium altitudes. The kat plant, a medicinal tonic, is largely grown in Harar province. On the higher plateaus the chief crops are wheat, barley, *teff*, peppers, vegetables of all kinds and coffee. Above 10,000ft. one finds barley, oats, beans and occasionally wheat. Of all cereals *teff* and barley are the most widely and generally grown. In the high plateaus sowing begins in May, in the lower plateaus and the plains in June, but where the summer is long and rain abundant sowing and reaping are going on at the same time. Most regions yield two, many three, crops a year.

Stock.—The land is admirably adapted for stock raising; enormous herds of cattle estimated at from 10 to 15 million head are found in Abyssinia, of which the most remarkable are the immensely long horned Sanga or Galla oxen. Most cattle are of the zebu or hump-backed variety, but there are also two breeds—one large, the other resembling the Jersey cattle—which are straight-backed. Sheep, of which there are also immense flocks, belong to the short and fat-tailed variety. The majority are not wool-bearing, but in one district a very small black sheep is raised for wool. The small mountain breed of sheep weigh no more than 20 to 30lb. apiece. Goats are of both the long and short-haired varieties, those from the Arusi Galla country having fine silky hair sometimes 16in. long. Large quantities of butter, generally rancid, are made from the milk of cows, goats and sheep. In the Leka province small black pigs are bred in considerable numbers. The horses (very numerous) are strong and only about 14 hands high. The best breeds come from the Shoa uplands. The ass is also small and strong; and the mule, bred in large numbers, is of excellent quality, and, both as a transport animal and as a mount, is preferred to the horse. The mule, which averages 12 hands, thrives in every condition of climate, is fever-proof, travels over the most difficult mountain passes with absolute security and carries a load of from 150 to 200lb.

Minerals.—In the south and west provinces placer gold mines along the water-courses are worked by Gallas as an industry subsidiary to tending their flocks and fields. In the Wallega district veins of gold-bearing quartz and finds of platinum have been reported. Iron, coal, potash and other minerals are found. Rock-salt is obtained from the province of Tigré.

Trade and Currency.—The small progress in the economic and commercial development may be attributed to disturbed political conditions (until quite recently), the lack of communications, bad methods of taxation, suspicion of foreign enterprise and currency difficulties. Some European commercial enterprises have been started and there are indications that the Government will be able to give more sympathetic attention in the future to this. A Belgian company has acquired the alcohol monopoly, but is meeting with great difficulties; a Franco-Belgian company has been formed for cotton cultivation, two Belgian companies are developing large coffee plantations in addition to a few smaller undertakings. Banking is a monopoly of the Bank of Abyssinia (a branch of the National Bank of Egypt) under charter of Emperor Menelek.

The total trade approximates £2,500,000 annually. The chief exports are coffee and hides, and the principal imports, salt, cotton fabrics and hardware. The main channel of trade is the Franco-Ethiopian railway, from Addis Ababa to the port of Jibuti in French Somaliland. The principal trade routes with the Sudan are via Gambela, Gallabat and Roseires. Other trade routes are through the Italian colony of Eritrea to Massawa, and through Harar to Berbera in British Somaliland. The currency is the Maria Theresa and Menelek dollars of a nominal

value of about 2s., but in parts of the country bars of salt or even cartridges are used.

Government.—The political institutions are of a feudal character, and within their provinces the *rases* and other chiefs exercise large powers. The empress and regent have a number of ministers and a council of elders of the Crown. The legal system (*Feta Negast*) is a strange combination of various origins based on the Mosaic Code, the chief judicial officer being known as the *Afa Negus* (breath of the king). From all decisions there is an appeal to the throne. The powerful Church (*q.v.*) is presided over by the *Abuna*, always a Copt nominated from Egypt. The priests, an ignorant body, teach the scriptures in Giz, a tongue understood by very few. Apart from this and two schools in Addis Ababa, for which a few European teachers have been

introduced, education is practically non-existent. The Abyssinian calendar divides the year into 12 months of 30 days each, followed by one month of five days (six in leap year). The year begins on 1st Maskaram, our Sept. 11 (12 in the European year preceding our leap year) and is then seven years behind the European year; from Jan. 1 to Sept. 10 it is eight years behind. The land is not held in fee simple but is subject to the control of the throne or the church. Revenue is derived from a 10% customs duty on imports, and from a levy on all forms of productions; but as the provincial governors receive no salaries the receipts of the central Government are subject consequently to fluctuations. (C. F. R.)

Defence.—The early history of Abyssinia was marked by the struggles of an early Christian community against pagan and Mohammedan invaders. Early Portuguese records (1520-27) contain some entries of military interest. King Theodore (b. 1818) first conceived the idea of organizing an Abyssinian army on European lines. His power was broken in 1868 by an expedition under Lord Napier of Magdala, sent to the succour of Europeans whom he had made prisoner. (See also EGYPT AND SUDAN, CAMPAIGNS IN, 1882-1899). In March 1896 Theodore's successor Menelek successfully defended the country against an Italian invading force, 200,000 men having responded to his call to arms. In time of war every able-bodied Abyssinian is expected to serve. According to recent estimates, about 250,000-300,000 Abyssinians (including a small standing army) could be equipped with modern rifles; but lack of commissariat would prevent a large force from keeping the field long. From 1890 onwards various expedients have been adopted ineffectively by the European Powers to limit the import of arms. The co-operation of Abyssinia, which joined the League of Nations in 1923, is now being sought (1928).

Under the terms of a treaty concluded in May 1902 an area near Itang (Baro river) bordering the Sudan cannot be used for any military purpose (State Papers, vol. 95, p. 467). (G. G. A.)

HISTORY

Early Records.—Abyssinia, or at least the northern portion of it, was included in the tract of country known to the ancients as Ethiopia, the northern limits of which reached at one time to about Syene. The connection between Egypt and Ethiopia was in early times very intimate, and occasionally the two countries were under the same ruler, so that the arts and civilization of the one naturally found their way into the other. In early times, too, the Hebrews had commercial intercourse with the Ethiopians; and according to Abyssinian tradition the queen of

Sheba who visited Solomon was a monarch of their country, and from their son Menelek the kings of Abyssinia claim descent. During the Captivity many of the Jews settled here and brought with them a knowledge of the Jewish religion. Under the Ptolemies, the arts as well as the enterprise of the Greeks entered Ethiopia, and led to the establishment of Greek colonies. Out of these Greek colonies appears to have arisen the kingdom of Auxume which flourished from the 1st to the 7th century A.D. and was at one time nearly coextensive with Abyssinia proper. The capital Auxume and the seaport Adulis were then the chief centres of the trade with the interior of Africa in gold dust, ivory, leather, aromatics, etc. At Axum, the site of the ancient capital, many vestiges of its former greatness still exist; and the ruins of Adulis, which was once a seaport on the bay of Annesley, are now about 4 miles from the shore (*see* the article, ETHIOPIA).

Introduction of Christianity.—Christianity was introduced into the country by Frumentius (*q.v.*), who was consecrated first bishop of Ethiopia by St. Athanasius of Alexandria about A.D. 330.

From the scanty evidence available it would appear that the new religion at first made little progress, and the Axumite kings seem to have been among the latest converts. Towards the close of the 5th century a great company of monks established themselves in the country, and since that time monachism has been a power among the people and not without its influence on the course of events. In the early part of the 6th century the king of the Homerites, on the opposite coast of the Red Sea, having persecuted the Christians, the emperor Justinian I. requested the king of Auxume, Caleb or El-Esbaha, to avenge their cause. He accordingly collected an army, crossed over into Arabia, and conquered Yemen (*c.* 525), which remained subject to Ethiopia for over 50 years. This was the most flourishing period in the annals of the country. The Ethiopians possessed the richest part of Arabia, carried on a large trade, which extended as far as India and Ceylon, and were in constant communication with the Greek empire. Their expulsion from Arabia, followed by the conquest of Egypt by the Mohammedans in the middle of the 7th century, changed this state of affairs, and the continued advances of the followers of the Prophet at length cut them off from almost every means of communication with the civilized world; so that, as Gibbon says, "encompassed by the enemies of their religion, the Ethiopians slept for near a thousand years, forgetful of the world by whom they were forgotten." About A.D. 960, a Jewish princess, Judith, conceived the design of murdering all the members of the royal family, and of establishing herself in their stead. During the execution of this project, the infant king was carried off by some faithful adherents, and conveyed to Shoa, where his authority was acknowledged and the Solomonean dynasty ruled for about 300 years; while Judith reigned for 40 years over the rest of the kingdom after which a usurping dynasty of Lasta held the reins of power (except in Shoa) until in 1268 the kingdom was restored to the royal house in the person of Yekūnō Amlāk.

Advent of the Portuguese.—Towards the close of the 15th century the Portuguese missions into Abyssinia began. A belief had long prevailed in Europe of the existence of a Christian kingdom in the far east, whose monarch was known as Prester John, and various expeditions had been sent in quest of it. Among others who had engaged in this search was Pedro de Covilham, who arrived in Abyssinia in 1490, and, believing that he had at length reached the far-famed kingdom, presented to the negūs, or emperor of the country, a letter from his master the king of Portugal, addressed to Prester John. Covilham remained in the country, but in 1507 an Armenian named Matthew was sent by the negūs to the king of Portugal to request his aid against the

Mohammedans. In 1520 a Portuguese fleet, with Matthew on board, entered the Red Sea in compliance with this request, and an embassy from the fleet visited the negūs, Lebna Dengel or Dawit (David) II., and remained in Abyssinia for about six years. One of this embassy was Father Francisco Alvarez, from whom we have the earliest and not the least interesting account of the country. Between 1528 and 1540 armies of Mohammedans, under the renowned general Mohammed Grañ (probably a Somali), entered Abyssinia from the low country to the south-east, and overran the kingdom, obliging the emperor to take refuge in the mountain fastnesses. In this extremity recourse was again had to the Portuguese, who sent a fleet, under the command of Stephen da Gama, from India, which arrived at Massawa in Feb. 1541. In the July following a force of 450 musqueteers, under the command of Christopher da Gama, younger brother of the admiral, left the fleet and marched into the interior, and being joined by native troops were at first successful against the enemy; but they were subsequently defeated, and their commander taken prisoner and put to death (Aug. 1542). On Feb. 21, 1543, however, Mohammed Grañ was shot in an engagement and his forces totally routed. After this, quarrels arose between the negūs and the Portuguese, who now wished the emperor publicly to profess himself a convert to Rome, which the negūs refused to do. The Jesuits who had accompanied or followed the da Gama expedition into Abyssinia, and fixed their headquarters at Fremona (near Adowa), were oppressed and neglected, but not actually expelled. In the beginning of the 17th century Father Pedro Paez arrived at Fremona, a man of great tact and judgment, who soon rose into high favour at court, and gained over the emperor to his faith. He directed the erection of churches, palaces and bridges in different parts of the country, and carried out many useful works. His successor Mendez was a man of much less conciliatory manners, and the feelings of the people became strongly excited against the intruders, till at length, on the death of the negūs, Socinius or Seged I., and the accession of his son Fasilidas in 1633, they were all sent out of the country, after having had a footing there for nearly a century and a half.

Penetration of European Travellers.—The French physician C. J. Poncet, who went there in 1698, via Sennar and the Blue Nile, was the only European that afterwards visited the country before Bruce in 1769. James Bruce's main object was to discover the sources of the Nile, which he was convinced lay in Abyssinia. Accordingly, leaving Massawa in Sept. 1769, he travelled via Axum (Aksum) to Gondar, and was well received by King Tekla Haimanot II. He accompanied the king on a warlike expedition round Lake Tana, crossing the genuine Blue Nile (Abbai) close to its point of issue from the lake. On a second expedition of his own he proved to his own satisfaction that the river originated some 40m. S.W. of the lake at a place called Geesh (Nov. 4, 1770). He showed that this river flowed into the lake, and left it by its now well-known outlet. In 1805 the first British mission under Lord Valentia and Mr. Henry Salt was sent to conclude an alliance with Abyssinia and obtain a port on the Red Sea in case France secured Egypt by dividing up the Turkish Empire with Russia. This mission was succeeded by many travellers, missionaries and merchants of all countries. Prominent amongst them were Dr. C. T. Beke (*q.v.*) who did much to extend geographical knowledge of the country from 1840 to 1843, and Mr. Mansfield Parkyns (1843-46) who wrote the most interesting book on the country since Bruce.

In 1830 Protestant missionary enterprise was begun by Samuel Gobat and Christian Kugler, who were sent out by the Church Missionary Society and were well received by the Ras of Tigré, but in 1838 most of the missionaries were obliged to leave the country owing to the opposition of the native priests. Later on, however (1856), Bishop Gobat conceived the idea of sending lay missionaries who would engage in secular occupations as well as missionary work. Their secular work appears to have been the more appreciated, and King Theodore employed them as workmen and established them at Gaffat, near his capital.

Position of the Negusa Nagast.—In order to obtain a clear view of native Abyssinian history, as distinct from the visits and

influence of Europeans, it must be borne in mind that during the last 300 years, and indeed for a longer period, for the old chroniclers may be trusted to have given a somewhat distorted view of the importance of the particular chieftains with whom they came in contact, the country has been merely a conglomeration of provinces and districts, ill defined, loosely connected and generally at war with each other. Of these the chief provinces have been Tigré (northern), Amhara (central), Gojam (north western) and Shoa (southern). The seat of government, or rather of overlordship, has usually been in Amhara, the ruler of which, calling himself *negusa nagast* (king of kings, or emperor), has exacted tribute, when he could, from the other provinces. The title of *negusa nagast* has been to a considerable extent based on the blood in the veins of the claimant. All the emperors have based their claims on their direct descent from Solomon and the queen of Sheba; but it is needless to say that in many, if not in most, cases their success has been due more to the force of their arms than to the purity of their lineage. Some of the rulers of the larger provinces have at times been given or have given themselves, the title of *negūs* or king, so that on occasion as many as three, or even more, *negūs* have been reigning at the same time; and this must be borne in mind by the student of Abyssinian history in order to avoid confusion of rulers. The whole history of the country is, in fact, with a few bright intervals due to the efforts of some of the more enlightened monarchs, one gloomy record of internecine wars, barbaric deeds and unstable governments, of adventurers usurping thrones, only to be themselves unseated, and of raids, rapine and pillage.

Thus, for example, though the Empire had been re-united under Yekūnō Amlāk of the Solomonean dynasty in 1268, the overlordship of the *Negūs* or *Negusa Nagast* (king of kings) had become purely nominal by the 18th century, and the rulers of Tigré and Amhara alternately held the real power. Between these two quasi-kingdoms there was perpetual hostility and much fighting, but without definite results until Kassa (later King Theodore of Magdala fame) appeared on the scene.

KING THEODORE

Origin and Rise.—Lij Kassa was born in Kwara, a small district of Western Amhara, in 1818. His father was a small local chief, and his uncle was governor of the districts of Dembea, Kwara and Chelga between Lake Tana and the undefined N.W. frontier. He was educated in a monastery, but preferred a more active life, and by his talents and energy came rapidly to the front. On the death of his uncle he was made chief of Kwara, but in consequence of the arrest of his brother Bilawa by Ras Ali, he raised the standard of revolt against the latter, and, collecting a large force, repeatedly beat the troops that were sent against him by the ras (1841-47). On one occasion peace was restored by his receiving Tavavich, daughter of Ras Ali, in marriage; and this lady is said to have been a good and wise counsellor during her lifetime. He next turned his arms against the Turks, in the direction of Massawa, but was defeated; and the mother of Ras Ali having insulted him in his fallen condition, he proclaimed his independence. As his power was increasing, to the detriment of both Ras Ali and Ubié, these two princes combined against him, but were heavily defeated by him at Gorgora (on the southern shore of Lake Tana) in 1853. Ubié retreated to Tigré, and Ras Ali fled to Begemeder, where he eventually died. Kassa now ruled in Amhara, but his ambition was to attain to supreme power, and after conquering Gojam and Tigré, he proclaimed himself *negusa nagast* of Ethiopia under the name of Theodore III. He now turned his attention to Shoa which still remained unsubdued.

Struggle with Shoa.—Retracing our steps for a moment in that direction, we find that in 1813 Sahale (or Sella) Selassie, younger son of the preceding ruler of Shoa, Wassen Seged, had proclaimed himself king of Ifat, Shoa and the Galla. His reign was long and beneficent, and by his wise measures and personal generosity, and by extending his hospitality to Europeans, he brought his country within the closer ken of civilized European powers. During his reign he received the missions of Major W. Cornwallis Harris, sent by the governor-general of India (1841),

and M. Rochet d'Héricourt, sent by Louis Philippe (1843), with both of whom he concluded friendly treaties on behalf of their respective governments. He was succeeded in 1847 by his eldest son, Haile Melikot, who, by increasing his dominions at the expense of the Galla, and by concluding a treaty with Ras Ali against Kassa in 1850 determined the latter to crush him at the earliest opportunity.

Thus it was that in 1855 Kassa, under the name of the emperor Theodore, advanced against Shoa with a large army. Dissensions broke out among the Shoans, and after a desperate and futile attack on Theodore at Debra-Berhan, Haile Melikot died of exhaustion and fever, nominating with his last breath his 11-year-old son Menelek as successor (Nov. 1855). After a hard fight, Menelek was defeated and handed over to the *negūs*, taken to Gondar and there trained in Theodore's service.

Decline of Power.—Theodore had by then reached the zenith of his career. He is described as being generous to excess, free from cupidity, merciful to his vanquished enemies, and strictly continent, but subject to violent bursts of anger and possessed of unyielding pride and fanatical religious zeal. He was also a man of intelligence, superior to those among whom he lived, with natural talents for governing and gaining the esteem of others. He had, further, a noble bearing and majestic walk, a frame capable of enduring any amount of fatigue, and is said to have been "the best shot, the best spearman, the best runner, and the best horseman in Abyssinia." Unfortunately, success turned his head, and he lost certain good influences around him by the death of his good queen Tavavich, and the murder by rebels of his two English friends and advisers, W. C. Plowden and J. T. Bell, whose deaths he avenged by the slaughter of 2,000 of the rebels.

His union with his second wife, Terunish, the proud daughter of the late Ras of Tigré, was a most unhappy one, and he seems to have given himself over to intoxication and lust, and to have exercised the most terrible cruelty in his campaigns against the Galla and the various districts in which rebellions broke out against him. This exhausted his strength and resources, and such of the country as he still dominated groaned under his heavy exactions.

Quarrel with Great Britain.—In Oct. 1862, Captain Cameron, who had been appointed in Feb. of that year to succeed Mr. Plowden as British consul, was sent home by Theodore, with a letter to the queen of Great Britain, which reached the Foreign Office on Feb. 12, 1863. This letter was put aside and no answer returned, and to this in no small degree are to be attributed the difficulties that subsequently arose with that country. In Nov. despatches were received from England, but no answer to the emperor's letter, and this, together with a visit paid by Captain Cameron to the Egyptian frontier town of Kassala, greatly offended him. Accordingly in Jan. 1864 Captain Cameron and his suite, with Messrs. Stern and Rosenthal, were cast into prison. When the news of this reached England, the government resolved, when too late, to send an answer to the emperor's letter, and selected Mr. Hormuzd Rassam to be its bearer. The British party on arrival at the king's camp in Damot, on Jan. 25, 1866, were received with all honour, and were afterwards sent to Kwarata, on Lake Tana, there to await the arrival of the captives. The latter reached Kwarata on March 12 and everything appeared to proceed favourably. A month later they started for the coast, but had not proceeded far when they were all brought back and put into confinement. The Europeans, although detained as prisoners, were not at first unkindly treated; but in the end of June they were sent to Magdala, where they were soon afterwards put in chains, suffered hunger, cold and misery, and were in constant fear of death. Meanwhile one of them, Mr. Flad, had been sent by Theodore with a letter to Queen Victoria, asking for European workmen and machinery, and with a view if possible to effect the release of the prisoners by conciliatory measures, Mr. Flad was sent back, with some artisans and machinery, and a letter from the queen, stating that these would be handed over to his majesty on the release of the prisoners and their return to Massawa. This, however, failed to influence the emperor, and the British Government at length saw that they must have recourse to arms.

Sir Robert Napier's Expedition.—In July 1867 it was resolved to send an army into Abyssinia to enforce the release of the captives, under Sir Robert Napier (1st Baron Napier of Magdala). The landing-place selected was Mulkutto (Zula), on Annesley Bay, the point of the coast nearest to the site of the ancient Adulis, and we are told that "the pioneers of the English expedition followed to some extent in the footsteps of the adventurous soldiers of Ptolemy, and met with a few faint traces of this old-world enterprise" (C. R. Markham). The force amounted to upwards of 16,000 men, besides 12,640 belonging to the transport service, and followers, making in all upwards of 32,000 men. The task necessitated a march over 400 miles of a mountainous and little-known country, inhabited by savage tribes, to the camp or fortress of Theodore. The commander-in-chief landed on Jan. 7, 1868, and soon after the troops began to move forward through the pass of Senafé, and southward through the districts of Agamé, Tera, Endarta, Wojerat, Lasta and Wadela.

In the meantime the power of Theodore in the country was rapidly waning. Shoa had already shaken off his yoke; Gojam was virtually independent; Walkeit and Simen were under a rebel chief; and Lasta, Waag and the country about Lake Ashangi had submitted to Wagshum Gobassié, who had also overrun Tigré and appointed Dejaz Kassai his governor. The latter, however, in 1867 rebelled against his master and assumed the supreme power of that province. At the time when the British troops made their appearance in the country Theodore had thus been reduced to great straits. His army, which at one time numbered over 100,000 men, was rapidly deserting him, and he could hardly obtain food for his followers. He resolved to quit his capital Debra-Tabor, which he burned, and set out with the remains of his army for Magdala. During this march he displayed an amount of engineering skill in the construction of roads, of military talent and fertility of resource, that excited the admiration and astonishment of his enemies. But after a heavy defeat near Magdala on April 10, Theodore sent Lieut. Prideaux, one of the captives, and Mr. Flad, accompanied by a native chief, to the British camp to sue for peace. Answer was returned, that if he would deliver up all the Europeans in his hands, and submit to the queen of Great Britain, he would receive honourable treatment. The captives were liberated and sent away, and accompanying a letter to the British general was a present of 1,000 cows and 500 sheep, the acceptance of which would, according to Eastern custom, imply that peace was granted. Through some misunderstanding, word was sent to Theodore that the present would be accepted, and he felt that he was now safe; but in the evening he learned that it had not been received, and despair again seized him. The next day, April 13, Magdala was stormed and taken, practically without loss, and within they found the dead body of the emperor, who had fallen by his own hand. The inhabitants and troops were subsequently sent away, the fortifications destroyed, and the town burned. The queen Terunish having expressed her wish to go back to her own country, accompanied the British army, but died during the march, and her son Alamayahu, the only legitimate son of the emperor, was brought to England, as this was the desire of his father.¹ The success of the expedition was in no small degree owing to the aid afforded by the several native chiefs through whose country it passed, and no one did more in this way than Dejaz Kassa or Kassai of Tigré. In acknowledgment of this, several pieces of ordnance, small arms and ammunition, with much of the surplus stores, were handed over to him, and the British troops left the country in May 1868.

THE EMPEROR MENELEK II.

Early Struggles as King of Shoa.—It is now time to return to the story of the young prince Menelek, who, as we have seen, had been nominated by his late father as ruler of Shoa, but was in Theodore's power in Tigré. In 1865, he took advantage of Theodore's difficulties with the British government and escaped to Workitu, queen of the Wollo Galla country. The emperor,

¹He was subsequently sent to school at Rugby, but died in his 19th year, on Nov. 14, 1879. He was buried at St. George's Chapel, Windsor.

who held as hostage a son of Workitu, threatened to kill the boy unless Menelek were given up; but the gallant queen refused, and lost both her son and her throne. The fugitive meanwhile arrived safely in Shoa, and was there acclaimed as negüs. For the next three years Menelek devoted himself to strengthening and disciplining his army, to legislation, to building towns, such as Liché (near Debra-Berhan), Worra Hailu (Wollo Galla country), etc., and to repelling the incursions of the Galla. On the death of Theodore (April 13, 1868) many Shoans, including Ras Dargé, were released, and Menelek began to feel himself strong enough to undertake offensive operations against the northern princes. But these projects were of little avail, for Kassai of Tigré, had by this time (1872) risen to supreme power in the north. With the help of the rifles and guns presented to him by the British, he had beaten Ras Bareya of Tigré, Wagshum Gobassié of Amhara and Tekla Giorgis of Gondar, and after proclaiming himself *negusa nagast* under the name of Johannes or John, was now preparing to march on Shoa. Here, however, Menelek was saved from probable destruction through the action of Egypt. This power had, by the advice of Werner Munzinger, then the Swiss governor of Massawa, seized and occupied in 1872 the northern province of Bogos; and, later on, insisted on occupying Hamasen also, for fear Bogos should be attacked. John, after futile protests, collected an army, and with the assistance of Ras Walad Michael, hereditary chief of Bogos, advanced against the Egyptian forces, who were under the command of one Arendrup, a Dane. Meeting near the Mareb, the Egyptians were beaten in detail, and almost annihilated at Gundet (Nov. 13, 1875). An avenging expedition was prepared in the spring of the following year, and, numbering 14,000 men under Ratib Pasha, Loring (American), and Prince Hassan, advanced to Gura and fortified a position in the neighbourhood. Although reinforced by Walad Michael, who had now quarrelled with John, the Egyptians were a second time (March 25, 1876) heavily beaten by the Abyssinians, and retired, losing an enormous quantity of both men and rifles. Colonel C. G. Gordon, governor-general of the Sudan, was now ordered to go and make peace with John, but the king had moved south with his army, intending to punish Menelek for having raided Gondar whilst he, John, was engaged with the Egyptians. Menelek's kingdom was meanwhile torn in twain by serious dissensions on the subject of the succession, but on the approach of John, the Shoans united for a time against their common enemy. After a few skirmishes, however, they melted away, and Menelek was obliged to submit and do obeisance to John. The latter behaved with much generosity, but at the same time imposed terms which effectually deprived Shoa of her independence (March 1878). In 1879 Gordon was sent on a fresh mission to John on behalf of Egypt; but he was treated with scant courtesy, and was obliged to leave the country without achieving anything permanent.

Advent of the Italians.—The Italians now come on the scene. Assab, a port near the southern entrance of the Red Sea, had been bought from the local sultan in March 1870 by an Italian company, which, after acquiring more land in 1879 and 1880, was bought out by the Italian Government in 1882. In this year Count Pietro Antonelli was despatched to Shoa in order to improve the prospects of the colony by treaties with Menelek and the sultan of Aussa; but both John and Menelek became uneasy when Beilul, a port to the north of Assab Bay, was occupied by the Italians in Jan. 1885, and Massawa taken over by them from Egypt in the following month. This latter act was greatly resented by the Abyssinians, for by a treaty concluded with a British and Egyptian mission under Admiral Hewett and Mason Pasha in the previous year, free transit of goods was to be allowed through this port. In Jan. 1887, the Abyssinians, in consequence of a refusal from General Gené to withdraw his troops, surrounded and attacked a detachment of 500 Italian troops at Dogali, killing more than 400 of them. Reinforcements were sent from Italy, whilst in the autumn the British Government stepped in and tried to mediate by means of a mission under Mr. (afterwards Sir Gerald) Portal. His mission, however, proved abortive, and after many difficulties and dangers he returned to Egypt at

the end of the year. In April 1888 the Italian forces, numbering over 20,000 men, came into touch with the Abyssinian army; but negotiations took the place of fighting, with the result that both forces retired, the Italians only leaving some 5,000 troops in Eritrea, as their colony was now called. Meanwhile John was also at war with the dervishes, who had in the meantime become masters of the Egyptian Sudan. Although he had set his troops in motion too late to relieve Kassala, Ras Alula, his chief general, inflicted a handsome defeat on Osman Digna at Kufit in Sept. 1885. Fighting between the dervishes and the Abyssinians continued, and in Aug. 1887 the dervishes entered and sacked Gondar. After some delay, King John took the field in force against the enemy, who were still harassing the north-west of his territory. A great battle ensued at Gallabat, in which the dervishes, under Zeki Tumul, were beaten. But a stray bullet struck the king, and the Abyssinians decided to retire. The king died during the night, and his body fell into the hands of the enemy (March 9, 1889).

Accession as Emperor of Abyssinia.—Immediately the news of John's death reached Menelek, he proclaimed himself king of kings of Ethiopia, and received the submission of Gondar, Gojam, and several other provinces, and later on of Mangasha, reputed son and heir of King John. As it happened, Count Antonelli was with Menelek when he claimed the throne, and promptly concluded (May 2, 1889) with him on behalf of Italy a friendly treaty, to be known hereafter as the famous Ucciali treaty. In consequence of this the Italians occupied Asmara, made friends with Mangasha and received Ras Makonnen,¹ Menelek's nephew, as his plenipotentiary in Italy; thus it seemed as though hostilities between the two countries had come to a definite end. For the next three years the land was fairly quiet, the chief political events being the convention (Feb. 6, 1891) between Italy and Abyssinia, protocols between Italy and Great Britain (March 24 and April 15, 1891) and a proclamation by Menelek (April 10, 1891), all on the subject of boundaries. As, however, the Italians became more and more friendly with Mangasha and Tigre the apprehensions of Menelek increased, till at last, in Feb. 1893, he wrote denouncing the Ucciali treaty, which differed in the Italian and Amharic versions. According to the former, the negus was bound to make use of Italy as a channel for communicating with other powers, whereas the Amharic version left it optional. Meanwhile the dervishes were threatening Eritrea. A fine action by Colonel Arimondi gained Agordat for Italy (Dec. 21, 1893), and a brilliant march by Colonel Baratieri resulted in the acquisition of Kassala (July 17, 1894).

War with Italy.—On his return Baratieri found that Mangasha was intriguing with the dervishes, and had actually crossed the frontier with a large army. At Koatit and Senafé (Jan. 13-15, 1895) Mangasha was met and heavily defeated by Baratieri, who occupied Adigrat in March. But as the year wore on the Italian commander pushed his forces unsupported too far to the south. Menelek was advancing with a large army in national support of Mangasha, and the subsequent reverses at Amba Alagai (Dec. 7, 1895) and Makalle (Jan. 21, 1896) forced the Italians to fall back.

Reinforcements of many thousands were meanwhile arriving at Massawa, and in Feb. Baratieri took the field at the head of over 13,000 men. Menelek's army, amounting to about 90,000, had during this time advanced, and was occupying a strong position at Abba Garima, near Adua (or Adowa). Here Baratieri attacked him on March 1, but the difficulties of the country were great, and one of the four Italian brigades had pushed too far forward. This brigade was attacked by overwhelming numbers, and on the remaining brigades advancing in support, they were successively cut to pieces by the encircling masses of the enemy. The Italians lost 4,600 white and nearly 3,000 native troops killed and wounded; the number of prisoners was estimated at between 2,500 and 3,000. The Abyssinians owned to a loss of over 3,000; but it is certain that their casualties were far greater, some writers placing the figure as high as 17,000. General Baldassera advanced with a large body of reinforcements to avenge this defeat,

¹Ras of Harar, which province had been conquered and occupied by Menelek in Jan. 1887.

but the Abyssinians, desperately short of supplies, had already retired, and beyond the peaceful relief of Adigrat, no further operations took place. On Oct. 26 following, a provisional treaty of peace was concluded at Addis Ababa, annulling the treaty of Ucciali and recognizing the absolute independence of Abyssinia. This treaty was ratified, and followed by other treaties and agreements defining the Eritrean-Abyssinian and the Abyssinian-Italian Somaliland frontiers (see ITALY, *History*, and SOMALILAND, *Italian*).

Consolidation and Extension of the Empire.—The war, so disastrous to Italy, attracted the attention of all Europe to Abyssinia and its monarch, and numerous missions, two Russian, three French and one British, were despatched to the country, and hospitably received by Menelek. The British one, under Mr. (afterwards Sir) Rennell Rodd, concluded a friendly treaty with Abyssinia (May 15, 1897), but did not, except in the direction of Somaliland, touch on frontier questions, which for several years continued a subject of discussion. During the same year (1897) a small French expedition under Clochette and de Bonchamps endeavoured to reach the Nile, but, after surmounting many difficulties, stuck in the marshes of the Upper Sobat, and was obliged to return. Another expedition of Abyssinians, under Dejaz Tassama and accompanied by three Europeans—Faivre (French), Potter (Swiss), and Artomonov (Russian)—started early in 1898 and reached the Nile at the Sobat mouth in June, a few days only before Major Marchand and his gallant companions arrived on the scene. But no contact was made, and the expedition returned to Abyssinia.

In the same year Menelek subdued Mangasha, who was again rebelling against his authority, and later conducted a number of expeditions in different parts of the country, notably against the Galla, and added immense provinces to the empire. An important treaty was concluded on May 15, 1902, between England and Abyssinia for the delimitation of the Sudan-Abyssinian frontier. Menelek, in addition, agreed not to obstruct the waters of Lake Tana, the Blue Nile or the Sobat, so as not to interfere with the Nile irrigation question, and he also agreed to give a concession, if such should be required, for the construction of a British railway through his dominions, to connect the Sudan with Uganda. A combined British-Abyssinian expedition (Mr. A. E. Butter's) was despatched in 1901 to propose and survey a boundary between Abyssinia on the one side and British East Africa and Uganda on the other; and the report of the expedition was made public by the British Government in Nov. 1904. It was followed in 1908 by an agreement defining the frontiers concerned. It is also an interesting fact that between 1899 and 1904 the Abyssinians co-operated with the British in their campaigns against the Mad Mullah of Somaliland by sending joint expeditions on no less than four occasions.

Growth of European Influence.—The first concession for a railway was the one from the coast at Jibuti (French Somaliland) to the interior, granted by Menelek to a French company in 1894. The company having met with numberless difficulties and financial troubles, the French Government, on the extinction of the company's funds, came to the rescue and provided money for the construction. (In the alternative, British capitalists interested in the company would have obtained control of the line.) The French government's help enabled the railway to be completed to Direddawa, 28m. from Harar, by the last day of 1902. Difficulties arose over the continuation of the railway to Addis Ababa and beyond, and the proposed internationalization of the line. These difficulties, which hindered the work of construction for years were composed (so far as the European Powers interested were concerned) in 1906 by the terms of an Anglo-French-Italian agreement, signed in London on Dec. 13 of that year.

Meanwhile the country slowly developed in parts and opened out cautiously to European influences. Most of the Powers appointed representatives at Menelek's capital—the British minister-plenipotentiary and consul-general, Lieut.-Colonel Sir J. L. Harrington, having been appointed shortly after the British mission in 1897. In Dec. 1903 an American mission visited Addis Ababa, and a commercial treaty between the United States and

Abyssinia was signed. A German mission visited the country early in 1905 and also concluded a treaty of commerce with the negus. Later in the year a German minister was appointed to the court of the emperor.

After 1897 British influence in Abyssinia, owing largely no doubt to the conquest of the Sudan, the destruction of the derwish power and the result of the Fashoda incident, was sensibly on the increase. Of the remaining powers France occupied the most important position in the country. Ras Makonnen, the most capable and civilized of Menelek's probable successors, died in March 1906, and Mangasha died later in the same year; the question of the succession therefore opened up the possibility that, in spite of recent civilizing influences, Abyssinia might still relapse in the future into its old state of conflict. The Anglo-French-Italian agreement of Dec. 1906, referred to above, contained provisions in view of this contingency. The preamble of the document declared that it was the common interest of the three Powers "to maintain intact the integrity of Ethiopia," and Article I. provided for their co-operation in maintaining "the political and territorial *status quo* in Ethiopia." Should, however, the *status quo* be disturbed, the Powers were to concert to safeguard their special interests. The terms of the agreement were settled in July 1906, and its text forthwith communicated to the negus. After considerable hesitation Menelek sent, early in December, a note to the Powers, in which, after thanking them for their intentions, he stipulated that the agreement should not in any way limit his own sovereign rights. (E. GL.; C. F. R.)

Lej Yasu.—The Emperor Menelek, who had converted a congeries of semi-independent kingdoms into a powerful state, died in 1913 and the country fell into a condition bordering on chaos. The stricken emperor had in 1908 nominated his grandson Lej Yasu (b. 1896) as his successor, under the regency of Ras Tessama, but no government was possible owing to the constant strife between the empress Taitu, the regent and other powerful nobles. In 1910 the empress was finally driven into retirement, and in 1911 Ras Tessama died.

Lej Yasu then took the reins of government into his own hands, although he was never crowned, and the state of the country became steadily worse. By his misgovernment, his tyrannical and dissolute conduct, and particularly by his inclination to Islam, he mortally affronted his own subjects, intensely proud as they were and are of their 15 centuries of Christian tradition. His support of the "Mad Mullah" of Somaliland, who claimed him as a cousin, and his efforts to build up a federation

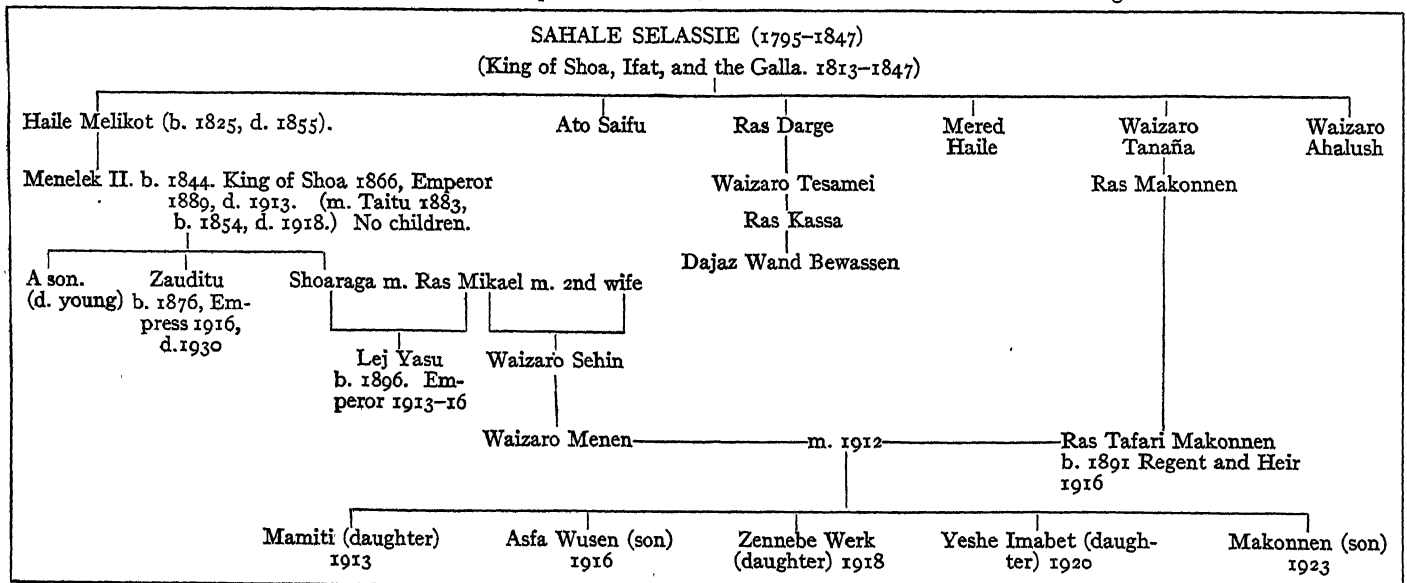

proclaimed Zauditu, a daughter of the Emperor Menelek, born in 1876, as Empress, and Dajazmach Tafari, born July 17, 1891, son of Menelek's nephew, Ras Makonnen, as Regent of the Empire, Heir to the Throne and Ras of Rases. Heavy fighting followed. Lej Yasu's father, Ras Mikael of Wollo Galla, raised large Galla forces to aid his son, but the troops of the deposed ruler were defeated with great slaughter at Sagalle on Oct. 27, 1916. Ras Mikael was taken prisoner, and Lej Yasu became a wanderer, first of all in the Dankali country and later in the province of Tigré.

EMPERESS ZAUDITU AND RAS TAFARI

Early Difficulties.—The coronation ceremonies of the new rulers took place in Feb. 1917, but Zauditu and Tafari succeeded to a troubled heritage. The great Rases and provincial governors had fallen back into semi-independence, and sporadic fighting with the followers of Lej Yasu, who was not finally captured until 1921, continued for some years. The dual nature of the government made it difficult to exercise effective control, and stimulated intrigue, but little by little the regent gathered together the reins of government, and improvements in administration, both central and local, were slowly achieved.

During this difficult period, in which he was criticized by the more reactionary Abyssinians for going too fast, and by European observers for not going fast enough, Ras Tafari exhibited many of the qualities of his father, Ras Makonnen, who had been not merely a fine soldier but a skilful diplomat, having conducted official missions to Paris, London and Rome. Tafari was aided in his task by the completion, in 1918, of the railway from the coast of French Somaliland to the capital, Addis Ababa. This link with the outside world undoubtedly played a considerable part in maintaining and strengthening the Regent's position and in stimulating intercourse with Europe, so much interrupted by the World War as well as by internal events.

The Succession.—Ras Tafari married Waizaro Menen, grand daughter of Ras Mikael, in 1912, and by her had two sons and three daughters, thus securing the succession to the throne in a direct line from the great King Sahale Selassie, of the House of Solomon. This is a very important matter from the point of view of Abyssinia's internal peace in the future, for the ex-emperor, Lej Yasu, is still alive, though in captivity, and the most powerful man in Abyssinia, Ras Kassa, is also a descendant of the Royal line (1928). The position of the rival claimants for the throne is exhibited in the following table:—

of Muslim states, anti-ally in its sentiments, also estranged the sympathies of the three great Powers with possessions bordering on Abyssinia. In Sept. 1916 he was excommunicated by the Abuna, the head of the Abyssinian Church. The great Rases, thus relieved of their oath of fealty, formally deposed him, and

Relations with Foreign Countries.—The African possessions of three European powers border on Abyssinia—Great Britain, France, and Italy—and of these the first named has by far the larger interests in the country. In the first place nearly 2,000 miles of British territory is coterminous with that of

Abyssinia; there are many hundreds of British and British-protected subjects resident there (Arabs, Indians, Somalis and others); and the question of the regulation of the waters of Lake Tana and the Blue Nile is closely linked with the subject of the irrigation of the Sudan. This latter question formed the subject of the Anglo-Italian exchange of notes in 1925, an agreement which caused some controversy owing to misunderstanding of its scope and intention. Its provisions, however, demonstrated clearly the absence of any desire for territorial expansion on the part of Britain at the expense of Abyssinia, a point emphasized by the fact that the Anglo-Abyssinian frontiers have all been fixed by treaty, and that no attempt to vary them has been made on the part of Britain. British policy towards Abyssinia has been part and parcel of her general policy since the eighties in the whole Nile basin—that is to protect the water needs of Egypt and the Sudan by treaty and agreement in those territories not actually in British occupation. The relations between Britain and Abyssinia are governed by the following treaties:—June 3, 1884, (a) settlement of differences between Abyssinia and Egypt, and (b) suppression of the slave trade; May 14, 1897, commerce, frontiers and transit of arms; May 15, 1902, Blue Nile and Lake Tana; and frontiers; Dec. 6, 1907, frontiers; April 13 and May 12, 1909, import duties. America has a commercial treaty with Abyssinia concluded in 1904; France and Italy have frontier delimitation treaties as well, and the former country concluded in 1908 an important treaty upon judicial procedure in respect to French subjects; Holland and Japan concluded treaties of friendship and commerce in 1926 and 1927.

Progress.—Ras Tafari's position was so far consolidated by 1922 that he was able to leave the country for a short visit to Aden, and in 1924 he visited the principal countries of Europe with an imposing retinue of over 20 Rases and officials, his absence lasting nearly five months. His greatest triumph was the admission of Abyssinia to the League of Nations on Sept. 28, 1923, subject to certain conditions as to the control of slavery and of the arms traffic. Progress, though slow according to European ideas, has since been made; the Regent opened a school at Addis Ababa into which he introduced European teachers, and a number of young Abyssinians were sent to America, England, and France for their education to be completed. A large American hospital has been erected and many roads have been made in and around Addis Ababa. European enterprise is beginning to take an interest in the country, and the infiltration of European ideas, though very slow and gradual, is real.

Much yet remains to be done. The illiteracy of the people, very few of whom can read or write, the existence of slavery, the authority and bigotry of the priesthood, and most of all the power of the great provincial chiefs, are obstacles to progress; the financial and general administration and also that of justice leave much to be desired, while the general condition of the peasantry, especially in those parts inhabited by conquered races, is far from satisfactory. But the guarantee of independence involved by admission to the League of Nations should tend to set at rest internal fears of foreign international rivalries and aspirations and thus facilitate domestic reform.

In May 1927 the duke of the Abruzzi was sent by the Italian Government to return the visit paid by Ras Tafari to Italy in 1924, and his week's stay at Addis Ababa was the occasion of a lavish display and much public rejoicing; the visit was doubtless intended to obliterate the effect caused by the 1925 Anglo-Italian Agreement which had antagonised Abyssinian feeling.

At this visit were also laid the foundations of an Italo-Abyssinian treaty of "perpetual friendship," which was signed at Addis Ababa on Aug. 2, 1928, providing for arbitration in all disputes arising between the two countries; and of a further, and unpublished (Sept. 1928), agreement for the cession to Abyssinia of a free zone at the port of Assab (in Eritrea) and the construction of a road thence to Addis Ababa.

A new and unexpected development in the Anglo-Abyssinian negotiations for the construction of works to regulate the flow of the Blue Nile occurred in 1926–27. The negotiations, which had been proceeding for nearly 30 years, had for their object the

better irrigation of the Sudan and Egypt, and Abyssinia is bound by treaty to allow no works of the kind to be constructed without the agreement of Great Britain, and, other things being equal, to give the work to British enterprise. A provisional arrangement, however, to build a dam, was come to in Nov. 1927, between the Abyssinian Government and the J. G. White Engineering Corporation of America; against this the British Government protested, as being a violation of their treaty rights.

In September 1928 the Regent was raised to the dignity of King, and on the death of the Empress on April 3, 1930 he became Negus Negusti, or King of Kings of Ethiopia, a title regarded as equivalent to Emperor.

Underhill, in the *Quarterly Review* (Jan. 1922); C. F. Rey, *Edinburgh Review* (Oct. 1926). (C. F. R.)

ABYSSINIAN CHURCH. As the chronicle of Axum relates, Christianity was adopted in Abyssinia in the 4th century. About A.D. 330 Frumentius was made first bishop of Ethiopia by Athanasius, patriarch of Alexandria. Little is known of church history down to the period of Jesuit rule, which broke the connection with Egypt from about 1500 to 1633.

Early in the 16th century the church was brought under the influence of a Portuguese mission. The initiative in the Roman Catholic missions to Abyssinia was taken by Portugal, as an incident in the struggle with the Muslims for the command of the trade route to India by the Red sea. In 1507 Matthew, or Matheus, an Armenian, had been sent as Abyssinian envoy to Portugal to ask aid against the Muslims, and in 1520 an embassy under Dom Rodrigo de Lima landed in Abyssinia.

Generally the Abyssinians agree with the Copts in ritual and practice (see article, Copts). The Septuagint was translated into the literary language, which is used for all services, though hardly understood. Saints and angels are highly revered, if not adored, but graven images are forbidden. Fasts are long and rigid. Confession and absolution, strictly enforced, give great power to the priesthood. Pilgrimage to Jerusalem is a religious duty and covers many sins.

For an account written shortly before the World War see Dowling, *The Abyssinian Church* (1909). The account of Alvarez was translated and edited for the Hakluyt Soc. by Lord Stanley of Alderley under the title *Narrative of the Portuguese Embassy to Abyssinia* (1881).

With reference to present social and political conditions, see ABYSSINIA. On the architecture, see J. C. Hotten, *Abyssinia Described* (1868), and (especially with reference to monuments of heathen origin) Bent, *The Sacred City of the Ethiopians* (1896).

ACACIA, a genus of shrubs and trees belonging to the family Leguminosae and the sub-family Mimoseae. The small flowers are arranged in rounded or elongated clusters. The leaves are generally compound pinnate (*see fig.*); in some instances more especially in the Australian species, the leaflets are suppressed and the leaf-stalks (petioles) become vertically flattened, and serve the purpose of leaves. The vertical position apparently prevents injury from the intense sunlight, as with their edges towards the sky and earth they do not intercept light so fully as ordinary horizontally placed leaves. There are about 550 species of acacia widely scattered over the warmer regions of the globe. They abound in Australia and Africa. Various species yield gum. True gum-arabic is the product of *Acacia Senegal*, abundant in both east and west tropical Africa. *Acacia arabica* is the gum-arabic tree of India, but yields a gum inferior to the true gum-arabic. Catechu (*q.v.*) or cutch, is procured from several species, but more especially from *Acacia catechu*; by boiling down the wood with this extract, true khaki cloth is dyed. The bark of *Acacia arabica*, under the name of *babul* or *babool*, is used in northern India for tanning. The bark of various Australian species, known as wattles, is also very rich in tannin and forms an important article of export. Such are *Acacia pycnantha*, golden wattle, *A. decurrens*, tan wattle, and *A. dealbata*, silver wattle. The pods of *Acacia nilotica*, under the name of *neb-neb*, and of other African species are also rich in tannin and used by tanners. The seeds of *Acacia niopo* are roasted and used as snuff in South America. Some species afford valuable timber; such are *Acacia melanoxylon*, black wood of Australia, which attains a great size; its wood is used for furniture, and takes a high polish; and *Acacia homalophylla* (also Australian), myall wood, which yields a fragrant timber, used for ornamental purposes. *Acacia formosa* supplies the valuable Cuba timber called *sabicu*. *Acacia seyal* is supposed to be the shittah tree of the Bible, which supplied shittim-wood. *Acacia heterophylla*, from Mauritius and Bourbon, and *Acacia koa* from the Sandwich Islands are also good timber trees. The plants often bear spines, especially those growing in arid districts in Australia or tropical and South Africa. These sometimes represent branches which have become short, hard and pungent, or sometimes leaf-stipules. *Acacia armata* is the kangaroo-thorn of Australia, *A. giraffae*, the African camel-thorn. In the Central American *Acacia sphaerocephala* (bull-thorn acacia) and *A. spadicigera*, the large thorn-like stipules are hollow and afford shelter for ants, which feed on a secretion of honey on the leaf-stalk and curious food-bodies at the tips of the leaflets. In common language the term Acacia is often applied to species of the genus *Robinia* (*q.v.*) which belongs also to the Leguminous family, but is placed in a different section. *Robinia Pseud-acacia*, or false acacia, is cultivated in the milder parts of Britain, and forms a large tree, with beautiful pea-like blossoms. The tree is sometimes called the locust tree.

FLOWERING BRANCH AND POD OF ACACIA SENEGAL, ONE OF 550 SPECIES OF ACACIA WIDELY DISTRIBUTED IN WARM REGIONS; A. SENEGAL PRODUCES GUM ARABIC

naturalized as a Frenchman, was the first composer of note associated with the Académie, of which he obtained control in 1672. Later Rameau became director and produced there nearly all of his many operas, and he was succeeded by Gluck as ruling spirit with Piccinni as his rival. Other eminent composers prominently identified with the Paris Opéra subsequently included Spontini, Cherubini, Rossini, Meyerbeer, Auber, Gounod, Saint-Saëns and Massenet. The present building of the Paris Opéra, opened in 1875 and one of the most magnificent of its kind in existence, succeeded two others, both of which were destroyed by fire. Closely associated with the Paris Opéra is the Conservatoire de Musique, founded in 1784 under the name École royale de chant et de déclamation for the purpose of training opera singers and later widened in scope to include musical teaching and training of every kind.

ACADEMIES. The word "academy" is derived from "the olive grove of Academe, Plato's retirement" (*see* under ACADEMY, GREEK). The schools of Athens after the model of the Academy continued to flourish almost without a break for nine centuries till they were abolished by a decree of Justinian. "Academy," in its modern acceptation, may be defined as a society or corporate body having for its object the cultivation and promotion of literature, of science and of art, either severally or in combination, undertaken for the pure love of these pursuits, with no interested motive. Modern academies, moreover, have, almost without exception, some form of public recognition; they are either founded, endowed or subsidized, or at least patronized, by the supreme head of the State. The term "academy" has been loosely used in modern times. In the 18th century it was frequently adopted by schools run by dissenters, and the name is often found attached to the public schools in Scotland and Northern Ireland. We are only concerned here, however, with those institutions which are of historical importance in their various spheres.

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART
A RENAISSANCE CONCEPTION OF A GREEK ACADEMY. FROM A 16TH CENTURY WOODCUT BY FRANCESCO MARCOLINI AFTER THE PAINTING, "THE ACADEMY OF KNOWLEDGE," BY GIUSEPPE PORTA

ACADÉMIE NATIONALE DE MUSIQUE, the official title of the Paris Opéra, also known as the Théâtre National de l'Opéra, founded by Louis XIV. in 1669 and the most famous institution of its kind in the world. Lully, an Italian by birth but

The first academy, as thus defined, though it might with equal justice claim to be the first of universities, was the museum of Alexandria founded at the beginning of the 3rd century B.C. by the first of the Ptolemies. There all the sciences then known were pur-

sued, and the most learned men of Greece and of the East gathered. Here, too, was the nucleus of the famous library of Alexandria. Modern literary academies may be said to trace their lineage in direct descent from the troubadours of the early 14th century. The first floral games were held at Toulouse in May, 1324, at the summons of a gild of troubadours, who invited "honourable lords, friends and companions who possess the science whence spring joy, pleasure, good sense, merit and politeness" to assemble in their garden of the "gay science" and recite their works. These floral games survived till about the year 1500. In 1694 the *Académie des Jeux Floraux* was constituted an academy by letters patent of Louis XIV. Suppressed during the Revolution it was revived in 1806, and still continues to award amaranths of gold and silver lilies, for which there is keen competition.

Provence led the way, but Italy of the Renaissance is the soil in which academies most grew and flourished. The *Accademia Pontaniana*, to give it its subsequent title, was founded at Florence in 1433 by Antonio Beccadelli of Palermo and fostered by Laurentius Valla. Far more famous was the *Accademia Platonica*, founded c. 1442 by Cosimo de' Medici, which numbered among its members Marsilio Ficino, Pico della Mirandola, Machiavelli and Angelo Poliziano. It was, as the name implies, chiefly occupied with Plato, but it added to its objects the study of Dante and the purification of the Italian language, and though it lived for barely half a century yet its influence as a model for similar learned societies was great and lasting.

I. SCIENTIFIC ACADEMIES

Austria.—The *Akademie der Wissenschaften* at Vienna, originally projected by Leibnitz, was founded by the emperor Ferdinand I. in 1846, and has two classes—mathematics and natural science, and history and philology.

Belgium and the Netherlands.—A literary society founded at Brussels in 1769 by Count Cobenzl, the prime minister of Maria Theresa, became in 1816 the *Académie royale des sciences et des Beaux-Arts de Belgique*, under the patronage of William I. of the Netherlands. In 1834 it became *Académie Royale Belgique*, while the Dutch portion took the name of the *Koninklijke Nederlandse Institut*. The Royal Institute of the Low Countries was founded in 1808 by King Louis Bonaparte. It was replaced in 1851 by the *Koninklijke Akademie van Wetenschappen* at Amsterdam, to which in 1856 a literary section was added.

Denmark.—The *Kongelige danske videnskabernes selskab* (Royal Academy of Sciences) at Copenhagen owes its origin to Christian VI. (1742). It developed into a sort of learned club. The king took it under his protection, enlarged its scope by the addition of natural history, physics and mathematics, and in 1743 constituted it a royal academy with an endowment fund.

France.—The old *Académie des sciences* had the same origin as the more celebrated *Académie française*. A number of men of science had for some 30 years met together. They included Descartes, Gassendi, Blaise and Etienne Pascal. Hobbes, the author of *Leviathan*, was presented to it during his first visit to Paris in 1640. Colbert conceived the idea of giving an official status to this learned club. A number of chemists, physicians, anatomists and eminent mathematicians—among whom were Christian Huyghens and Bernard Frenicle de Bessy (1605–75), the author of a famous treatise on magic squares—were chosen to form the nucleus of the new society. Pensions were granted by Louis XIV. to each of the members, and a fund for instruments and experiment was placed at their disposal. They began their session on Dec. 22, 1666, in the royal library. At first the academy was rather a laboratory and observatory than an academy proper. Several foreign *savants*, in particular the Danish astronomer Rømer, joined the society; and the German physician and geometer, Tschirnhausen, and Sir Isaac Newton were made foreign associates. After the death of Colbert the labours of the academicians were diverted from the pursuit of pure science to such works as the construction of fountains and cascades at Versailles, and the mathematicians were employed to calculate the odds of the games of lansquenet and basset. In 1699 the academy was reconstituted. By its new constitution it consisted of 25 members, ten honorary,

men of high rank interested in science, and 15 pensionaries, who were the working members. Of these three were geometers, three astronomers, three mechanicians, three anatomists and three chemists. Each of these three had two associates, and, besides, each pensionary had the privilege of naming a pupil. There were eight foreign and four free associates. The constitution was purely aristocratical, differing in that respect from that of the French Academy, in which the principle of equality among the members was never violated. The leading spirits of the academy at this period were Clairault, Réaumur and Fontenelle, the popularizer of science. In the 18th century other prominent members were Laplace, Buffon, Lagrange, D'Alembert, Lavoisier and Jussieu, the father of modern botany. It was suppressed on April 8, 1793.

In 1795 the Convention decided on founding an *Institut National* which was to replace all the academies. In 1816 the *Académie des sciences* was reconstituted as a branch of the Institute. The new academy has reckoned among its members, besides many other brilliant men, Carnot the engineer, the physicist Fresnel, Ampère, Arago, Biot, the chemists Gay-Lussac and Thénard, the zoologists G. Cuvier and the two Geoffroy Saint-Hilaires. In France there were also academies in most of the large towns. Montpellier, for example, had a royal academy of sciences, founded in 1706 by Louis XIV., reconstituted in 1847, and organized under three sections—medicine, science and letters. There were analogous institutions at Toulouse, Nîmes, Arles, Lyons, Dijon, Bordeaux and elsewhere.

Germany.—The *Collegium Curiosum* was a scientific society, founded by J. C. Sturm, professor in the University of Altorf, in Franconia, in 1672, on the plan of the *Accademia del Cimento*. It originally consisted of 20 members, and continued to flourish long after the death of its founder. Two volumes (1676–85) of proceedings were published by Sturm. The former, *Collegium Experimentale sive Curiosum*, begins with an account of the diving-bell, "a new invention"; next follow chapters on the camera obscura, the Torricellian experiment, the air-pump, microscope, telescope, etc. It is now extinct.

The *Preussische Akademie der Wissenschaften* in Berlin holds the first place in Germany. Its origin was the *Societas Regia Scientiarum* constituted in 1700 by Frederick I. on the comprehensive plan of its first president, Leibnitz. It was reorganized under Frederick II. on the French model furnished by Maupertuis, and received its present constitution in 1812. It is divided into two classes and four sections—physical and mathematical, philosophical and historical. Among the contributors to its transactions (first volume published in 1710), to name only the dead, we find Immanuel Bekker, Böckling, Bernoulli, F. Bopp, P. Buttmann, Encke (of comet fame), L. Euler, the brothers Grimm, the two Humboldts, Lachmann, Lagrange, Leibnitz, T. Mommsen, J. Müller, G. Niebuhr, C. Ritter (the geographer), Savigny and Zumpt. To the *Berlin Academy* we owe the *Corpus Inscriptionum Graecarum*, the *Corpus Inscriptionum Latinarum*, and the *Monumenta Germaniae Historica*.

The *Bayerische Akademie der Wissenschaften*, at Munich, founded in 1759, is distinguished by the part it has played in national education. Maximilian Joseph, the enlightened elector (afterwards king) of Bavaria, induced the Government to hand over to it the organization and superintendence of public instruction, and this work was carried out by Privy-councillor Jacobi, the president of the academy. In recent years the academy has specially occupied itself with natural history.

The *Preussische Akademie gemeinnütziger Wissenschaften*, at Erfurt, which dates from 1754 and devotes itself to applied science, and the Hessian academy of sciences at Giessen, which publishes medical transactions, also deserve mention.

Great Britain and Ireland.—In 1616 a scheme for founding a royal academy was started by Edmund Bolton, an eminent scholar and antiquary, who in his petition to King James I. proposed that the title of the academy should be "King James, his Academe or College of honour." A list of the proposed original members is still extant, and includes the names of George Chapman, Michael Drayton, Ben Jonson, John Selden, Sir Kenelm Digby and Sir Henry Wotton. The death of King James put an

end to the undertaking. About 1645 the more ardent followers of Bacon used to meet, some in London, some at Oxford, for the discussion of subjects connected with experimental science. This was the original of the Royal Society (*q.v.*) which received its charter in 1662.

A society was formed in Dublin similar to the Royal Society in London, as early as 1683; but it was short-lived. The Royal Irish Academy grew from a society established in Dublin about 1782 by a number of gentlemen, most of whom belonged to the university. The first volume of transactions appeared in 1788.

Hungary.—The *Magyar Tudományos Társaság* (Hungarian Academy of Sciences) was founded in 1825 by Count Stephen Széchenyi for the encouragement of the study of the Hungarian language and the various sciences. It has a fine building in Budapest containing a picture gallery and housing various national collections.

Italy.—The *Accademia Secretorum Naturae* was founded at Naples in 1560 by Giambattista della Porta. The condition of membership was to have made some discovery in natural science. Della Porta was suspected of practising the black arts and summoned to Rome to justify himself before the papal court. He was acquitted on those charges by Paul V., but commanded to close his academy.

The *Accademia dei Lincei* was founded in 1603 by Federigo Cesi, the marchese di Monticelli. Galileo and Colonna were among its earliest members. As a monument the Lincei have left the magnificent edition of Fernandez de Oviedo's *Natural History of Mexico* (Rome, 1651, fol.), printed at the expense of the founder and elaborately annotated by the members. This academy was resuscitated in 1870 under the title of *Reale Accademia Nazionale dei Lincei*, with a literary as well as a scientific side, endowed in 1878 by King Humbert, and in 1883 it received official recognition from the Italian Government, being thereafter lodged in the Corsini palace, whose owner made over to it his valuable library and collections.

The *Accademia del Cimento* was founded at Florence in 1657 by Leopold de' Medici, brother of the grand duke Ferdinand II., at the instigation of Vincenzo Viviani, the geometrician. It was an academy of experiment, a deliberate protest against the deductive science of the quadrivium. It lasted only ten years, but the grand folio published in Italian (afterwards translated into Latin) in 1667 is a landmark in the history of science. It contains experiments on the pressure of the air (Torricelli and Borelli were among its members), on the incompressibility of water and on universal gravity.

Science in Italy is now represented by the *Reale Accademia di Scienze Lettere ed Arti degli Agrati in Rovereto*, formerly the *Reale Accademia delle Scienze* (Royal Academy of Sciences), founded in 1750 as a private society, and incorporated by royal warrant in 1783. It consists of 40 full members, who must be residents of Turin, 20 non-resident, and 20 foreign members. It publishes a yearly volume of proceedings and awards prizes for learned works. There are, besides, royal academies of science at Naples, Lucca and Palermo.

Portugal.—The *Academia Real das Sciencias* (now *Acad. das Sciencias de Lisboa*) dates from 1779. It was reorganized in 1851 and since then has been chiefly occupied in the publication of *Portugaliae Monumenta Historica*.

Russia.—The *Académie Impériale des sciences de Saint-Petersbourg* (*Imperatorskaya Akademiya nauk*), was established on Dec. 21, 1725, by Catherine I. Shortly afterwards the empress settled a fund of £4,982 per annum for the support of the academy; and 15 eminent members were admitted and pensioned, under the title of professors in the various branches of science and literature. The most distinguished of these were Nicholas and Daniel Bernoulli, the two Delisles, Bilfinger and Wolff. At the accession of Elizabeth the original plan was enlarged and improved; learned foreigners were drawn to St. Petersburg (Leningrad); and, what was considered a good omen for the literature of Russia, two natives, Lomonosov and Rumovsky, men of genius who had prosecuted their studies in foreign universities, were enrolled among its members. The annual income was increased to £10,659. Cath-

erine II. utilized the academy for the advancement of national culture. By her recommendation the most intelligent professors visited all the provinces of her vast dominions, with most minute and ample instructions to investigate the natural resources, conditions and requirements, and report on the real state of the empire. The result was that no country at that time could boast, within so few years, such a number of excellent official publications on its internal state, its natural productions, its topography, geography and history, and on the manners, customs and languages of the different tribes that inhabited it, as came from the press of this academy. In its researches in Asiatic languages, oriental customs and religions, it proved itself the worthy rival of the Royal Asiatic Society in England. The first transactions, *Commentarii Academiae Scientiarum Imperialis Petropolitanae ad annum 1726*, with a dedication to Peter II., were published in 1728. In 1747 the transactions were called *Novi Commentarii Academiae*, etc.; and in 1777, *Acta Academiae Scientiarum Imperialis Petropolitanae*. The papers, hitherto in Latin only, were now written indifferently in Latin or in French. Of the *Commentaries*, 14 volumes were published; of the *New Commentaries* (1750–76) twenty. Of the *Acta Academiae* two volumes are printed every year. In 1872 there was published at St. Petersburg, in 2 vols., the valuable *Tableau général des matières contenues dans les publications de l'Académie Impériale des Sciences de St. Petersburg*. The academy of to-day has three divisions: (1) physical and mathematical sciences; (2) Russian language and literature; (3) historical science and philology. A large number of laboratories and museums are affiliated to it, as well as a physico-mathematical and an Indo-European Institute. The Asiatic museum and the mineralogical museum are housed in this building, and also the academical botanical museum. The vast library of the Academy of Sciences is situated in a separate building, erected 1718–25. Its scientific publications are exempt from censorship and include transactions of its various sections, a monthly and a yearly journal. These are edited by the scientific staff of the academy, but published by the Soviet Government Publishing Department.

Spain.—The *Real Academia Española* at Madrid (*see below*) had a predecessor in the *Academia Naturae curiosorum* (dating from 1657) modelled on that of Naples. It was reconstituted in 1847 after the model of the French Academy.

Sweden.—The *Kongliga Svenska Vetenskaps-academien* owes its institution to six persons of distinguished learning, among whom was Linnaeus. In 1739 they formed a private society, the *Collegium Curiosorum*. In March 1741 it was incorporated as the Royal Swedish Academy. Though under royal patronage and largely endowed, it is, like the Royal Society in England, entirely self-governed. The dissertations read at each meeting are published in the Swedish language, quarterly, and make an annual volume. The first 40 volumes, octavo, completed in 1779, are called the *Old Transactions*.

Norway has an active Academy of Sciences at Oslo; Japan has an Imperial Academy at Tokyo; Yugoslavia has two academies, one Serbian at Belgrade and one Yugoslav at Zagreb. Czechoslovakia has the Czech Academy of Sciences and Arts at Prague.

II. ACADEMIES OF BELLES LETTRES

Belgium.—Belgium has always been famous for its literary societies. The little town of Diest boasts that it possessed a society of poets in 1302, and the Catherinists of Alost date from 1107. It is at least certain that numerous chambers of rhetoric (so academies were then called) existed in the first years of the rule of the house of Burgundy.

France.—The French Academy (*l'Académie française*) was established by order of the king in the year 1635, but in its original form existed four or five years earlier. About the year 1629 certain literary friends in Paris agreed to meet informally each week. The conversation turned mostly on literary topics; and when one of the number had finished some literary work he read it to the rest, and they gave their opinions upon it. The fame of these meetings, though the members were bound to secrecy, reached the ears of Cardinal Richelieu, who promised his protec-

tion and offered to incorporate the society by letters patent. These were granted by the king on Jan. 29, 1635. The officers consisted of a director and a chancellor, chosen by lot, and a permanent secretary, chosen by vote. The director presided at the meetings, being considered as *primus inter pares*. The chancellor kept the seals and sealed all the official documents of the academy. The cardinal was *ex officio* protector.

The number of members was fixed at 40, but it was not till 1639 that the full number was completed. Their first undertaking consisted of essays written by the members in rotation. Next, at the instance of Cardinal Richelieu, they undertook a criticism of Corneille's *Cid*, the most popular work of the day. It was a rule of the academy that no work could be criticized except at the author's request, but fear of incurring the cardinal's displeasure wrung from Corneille an unwilling consent. The critique of the academy was re-written several times before it met with the cardinal's approbation. After six months of elaboration it was published under the title, *Sentiments de l'académie française sur le Cid*. This judgment did not satisfy Corneille, as a saying attributed to him on the occasion shows. "*Horatius*," he said, referring to his last play, "was condemned by the Duumviri, but he was absolved by the people." But the crowning labour of the academy, begun in 1639, was a dictionary of the French language. By the 26th article of their statutes they were pledged to compose a dictionary, a grammar, a treatise on rhetoric and one on poetry. Jean Chapelain, one of the original members, drew up a plan for compiling the dictionary, which was to a great extent carried out. C. F. de Vaugelas was appointed editor-in-chief. The first edition of this dictionary appeared in 1694, the sixth and last in 1835, since when *compléments* have been added.

Reconstruction.—The old *Académie* perished with other pre-revolutionary academies in 1793, and it has little but the name in common with the present academy, a section of the institute. The object of the Convention in 1795 was, as already stated, to rebuild all the institutions that the Revolution had shattered and to combine them in an organic whole. The institute was at first composed of 184 members resident in Paris and an equal number living in other parts of France, with 24 foreign members, divided into three classes: (1) physical and mathematical science, (2) moral and political science, (3) literature and the fine arts. It held its first sitting on April 4, 1796. Napoleon as first consul suppressed the second class, as subversive of government, and reconstituted the other classes as follows: (1) as before, (2) French language and literature, (3) ancient history and literature, (4) fine arts. The class of moral and political science was restored on the proposal of M. Guizot in 1832, and the present institute consists of the five classes named above. Each class or academy has its own special jurisdiction and work, with special funds; but there is a general fund and a common library, which, with other common affairs, are managed by a committee of the institute—two chosen from each academy, with the secretaries.

The class of the institute which deals with the language and literature takes precedence, and is known as the *Académie française*. There was at first no perpetual secretary, each secretary of sections presiding in turn. Shortly afterwards J. B. Suard was elected to the post, and ever since the history of the academy has been determined by the reigns of its successive perpetual secretaries. The secretary, to borrow an epigram of Sainte-Beuve, both reigns and governs. Among the best known in the 19th century were Suard, François Juste Raynouard, François Andrieux and Villemain. Under Raynouard the academy ran a tilt against the abbé Delille and his followers. Under Auger it did battle with romanticism, "a new literary schism." Auger did not live to see the election of Lamartine in 1829, and it needed ten more years for Victor Hugo after many vain assaults to enter by the breach. The academy is professedly non-political. It accepted and even welcomed in succession the empire, the restoration and the reign of Louis Philippe, and it tolerated the republic of 1848; but to the Second Empire it offered a passive resistance, and no politician of the Second Empire, whatever his gifts as an orator or a writer, obtained an armchair. The one seeming exception, Emile Ollivier, confirms the rule. He was elected on the eve of the Franco-Ger-

man War, but his *discours de réception*, a eulogy of the emperor, was deferred and never delivered. The institute has large vested funds in property, including the magnificent estate and library of Chantilly bequeathed to it by the duc d'Aumale. It awards various prizes, of which the most considerable are the Montyon prizes, each of 20,000frs., one for the poor Frenchman who has performed the most virtuous action during the year, and one for the French author who has published the book calculated to prove of most service to morality.

A point of considerable interest is the degree in which, since its foundation, the French Academy has or has not represented the best literary life of France. It appears from an examination of the lists of members that a surprising number of authors of the highest excellence have, from one cause or another, escaped the honour of academic "immortality." When the academy was founded in 1634, the moment was not a very brilliant one in French letters. Among the 40 original members we find only ten who are remembered in literary history; of these four may reasonably be considered famous still—Balzac, Chapelain, Racan and Voiture. In that generation Scarron was never one of the 40, nor do the names of Descartes, Malebranche or Pascal occur. The one astounding omission of the 17th century, however, is the name of Molière, who was excluded by his profession as an actor; but the academy has made the *amende honorable* by placing in the *Salle des séances* a bust of Molière, with the inscription "*Rien ne manque à sa gloire, il manquait à la nôtre*." On the other hand, the French Academy was never more thoroughly representative of letters than when Boileau, Corneille, La Fontaine, Racine and Quinault were all members. Of the great theologians of that and the subsequent age, the academy included Bossuet, Fléchier, Fénelon and Massillon, but not Bourdaloue. La Bruyère and Fontenelle were among the 40, but not Saint-Simon, whose claims as a man of letters were unknown to his contemporaries. Early in the 18th century almost every literary personage of eminence found his place naturally in the academy. The only exceptions of importance were Vauvenargues, who died too early for the honour, and two men of genius but of dubious social position, Le Sage and the abbé Prévost d'Exiles. The approach of the Revolution affected gravely the *personnel* of the academy. Montesquieu and Voltaire belonged to it, but not Rousseau or Beaumarchais. Of the Encyclopaedists, the French Academy opened its doors to D'Alembert, Condorcet, Volney, Marmontel and La Harpe, but not to Diderot, Rollin, Condillac, Helvétius or the Baron d'Holbach. Apparently the claims of Turgot and of Quesnay did not appear to the academy sufficient, since neither was elected. In the transitional period, when the social life of Paris was distracted and the French Academy provisionally closed, neither André Chénier nor Benjamin Constant nor Joseph de Maistre became a member. In the early years of the 19th century considerations of various kinds excluded from the ranks of the 40 the dissimilar names of Lamennais, Prud'hon, Comte and Béranger. Critics of the French Academy are fond of pointing out that neither Stendhal, nor Balzac, nor Théophile Gautier, nor Flaubert, nor Zola penetrated into the Mazarine palace. It is not so often remembered that writers so academic as Thierry and Michelet and Quinet suffered the same exclusion. In later times neither Alphonse Daudet nor the brothers de Goncourt, nor Guy de Maupassant were members. Verlaine, although a poet of genius, was of the kind that no academy can ever be expected to recognize.

Concerning the influence of the French Academy on the language and literature, the most opposite opinions have been advanced. Thus Matthew Arnold, in his *Essay on the Literary Influence of Academies*, has pronounced a glowing panegyric on the French Academy as a high court of letters, and a rallying-point for educated opinion, as asserting the authority of a master in matters of tone and taste. To it he attributes in a great measure that thoroughness, that openness of mind, that absence of vulgarity which he finds everywhere in French literature; and to the want of a similar institution in England he traces that eccentricity, that provincial spirit, that coarseness which, as he thinks, are barely compensated by English genius. Thus, too, Renan, one of its most distinguished members, says that owing to the academy "one

can say everything in the language of well-bred persons without being pedantic. Do not say they have done nothing, these obscure devotees of culture who spend their lives in investigating the credentials of words and weighing up syllables. They have produced a masterpiece—the French language.” On the other hand, its inherent defects have been vigorously summed up by P. Lanfrey in his *Histoire de Napoléon*. The truth probably lies midway between the two extremes. Like all national institutions, the French Academy is a rather conservative body to which only people of a certain age and with well established reputations are elected. As a protest against such a state of things, the *Académie Goncourt* was founded by E. de Goncourt in 1896. It contains ten academicians whose principal function is to award an annual prize of 5,000 francs, preferably to a young novelist. None the less, since 1890, the *Académie française* may be said to have been fairly representative of the nation's culture. Among the critics may be cited, Brunetière, Lemaître, Foguet; among the poets, Sully Prudhomme, Richépin, de Regnier, Valéry; among the novelists, Bourget, Anatole France, Loti, Prevost; among the dramatists, Hervieu, Cureau, Rostand, Brieux; among the historians, Masson, Vandal, Hanotaux, etc.; among the philosophers, Boutroux and Bergson. Of the writers best known abroad who have not been elected members of the academy are Maeterlinck, Romain Rolland, Proust and Gide.

Germany.—Of the German literary academies the most celebrated was *Die Fruchtbringende Gesellschaft* (the Fruitful Society), established at Weimar in 1617. Five princes were among the original members. The object was to purify the mother tongue. The German academies copied those of Italy in their quaint titles and petty ceremonials, and exercised little permanent influence on the language or literature of the country. Other noteworthy modern societies are the *Berlinsche Gesellschaft für Deutsche Sprache*, the *Deutsche Shakespeare Gesellschaft*, and the *Goethe Gesellschaft*.

Italy.—Italy in the 16th century was remarkable for the number of its literary academies. Tiraboschi, in his *History of Italian Literature*, has given a list of 171; and Jarkius, in his *Specimen Historiae Academicarum Conditarum*, enumerates nearly 700. Many of these, with a sort of Socratic irony, gave themselves ludicrous names, or names expressive of ignorance. Such were the *Lunatici* of Naples, the *Estravaganti*, the *Fulminales*, the *Trapesisti*, the *Drowsy*, the *Sleepers*, the *Anxious*, the *Confused*, the *Unstable*, the *Fantastic*, the *Transformed*, the *Ethereal*. “The first academies of Italy chiefly directed their attention to classical literature. . . . It was not till the writings of Bembo furnished a new code of criticism in the Italian language that they began to study it with the same minuteness as modern Latin” (Hallam, *Int. to Lit. of Europe*). The Italian nobility, excluded as they mostly were from politics, and living in cities, found in literature a consolation and a career. Such academies were oligarchical in their constitution; they encouraged culture, but tended to hamper genius and extinguish originality. Far the most celebrated was the *Accademia della Crusca* or *Furfuratorium*; that is, of bran, or of the sifted, founded in 1582. The title was borrowed from a previous society at Perugia, the *Accademia degli Scossi*, of the well-shaken. Its device was a sieve; its principal object the purification of the language. Its great work was the *Vocabulario della Crusca*, printed at Venice in 1612. It was composed avowedly on Tuscan principles, and regarded the 14th century as the Augustan period of the language. Paul Beni assailed it in his *Anti-Crusca*, and this exclusive Tuscan purism has disappeared in subsequent editions. The *Accademia della Crusca* is now incorporated with two older societies—the *Accademia degli Apatici* (the Impartials) and the *Accademia Fiorentina*.

Among the numerous other literary academies of Italy we may mention the Academy of Naples, founded about 1440 by Alphonso, the king; the Academy of Florence, founded 1540, to illustrate and perfect the Tuscan tongue, especially by the close study of Petrarch; the *Intronati* of Siena, 1525; the *Infiammati* of Padua, 1534; the *Rozzi* of Siena, suppressed by Cosimo, 1568. In 1690 the *Accademia degli Arcadi* was founded at Rome, for the purpose of reviving the study of poetry, by Crescimbeni, the author of a

history of Italian poetry. Its members came to its meetings masked and dressed like Arcadian shepherds. Within ten years from its establishment the number of academicians was 600. The Royal Academy of Savoy was founded in 1719, and made a royal academy by Charles Albert in 1848. Its emblem was a gold orange-tree full of flowers and fruit; its motto “*Flores fructusque perennes*,” the same as that of the famous Florimontane Academy, founded at Annecy by St. Francis de Sales. It published valuable memoirs on the history and antiquities of Savoy. Mention should also be made of the *Società Dantesca Italiana*.

Spain.—The *Real Academia Española* at Madrid held its first meeting in July 1713, in the palace of its founder, the duke d'Escalona. In 1714 the king granted them the royal confirmation and protection. The number of its members was limited to 24; the duke d'Escalona was chosen director for life, but his successors were elected yearly, and the secretary for life. Their object, as marked out by the royal declaration, was to cultivate and improve the national language. They were to begin with choosing carefully such words and phrases as have been used by the best Spanish writers; noting the low, barbarous or obsolete ones; and composing a dictionary wherein these might be distinguished from the former. Another important Spanish Academy is the *Real Academia de la Historia* at Madrid.

III. ACADEMIES OF ARCHAEOLOGY AND HISTORY

France.—The old *Académie des inscriptions et belles-lettres* (or “*Petite Académie*,” founded in 1663) was an offshoot of the French Academy, which then at least contained the *élite* of French learning. Louis XIV. was of all French kings the one most occupied with his own aggrandisement. Literature, and even science, he encouraged only so far as they redounded to his own glory. Thus it was that the Academy of Inscriptions arose. At the suggestion of Colbert a company (a committee we should now call it) had been appointed by the king, chosen from the French Academy, charged with the office of furnishing inscriptions, devices and legends for medals. It consisted of four academicians: Chapelain, then considered the poet laureate of France; the abbé Amable de Bourzeis (1606–71); François Charpentier (1620–1702), an antiquary of high repute, and the abbé Jacques de Casagnes (1636–79). Their meetings were principally occupied with discussing the inscriptions, statues and pictures intended for the decoration of Versailles; and their first published work was a collection of engravings, accompanied by descriptions, designed for some of the tapestries at Versailles. Later Félibien, the learned architect, and the two great poets Racine and Boileau, were added to their number. A series of medals was commenced, entitled *Médailles de la Grande Histoire*, or, in other words, the history of *Le Grand Monarque*.

But it was to M. de Pontchartrain, comptroller-general of finance and secretary of State, that the academy owed its institution. By a new regulation, dated July 16, 1701, the *Académie royale des inscriptions et médailles* was instituted, being composed of ten honorary members, ten pensioners, ten associates, and ten pupils. In 1716 the regent changed its title to that of the *Académie des inscriptions et belles-lettres*, a title which better suited its new character.

In the great battle between the ancients and the moderns which divided the learned world in the first half of the 18th century, the Academy of Inscriptions naturally espoused the cause of the ancients, as the Academy of Sciences did that of the moderns. During the earlier years of the French Revolution the academy continued its labours uninterruptedly; and on Jan. 22, 1793, the day after the death of Louis XVI., we find in the *Proceedings* that M. Bréquigny read a paper on the projects of marriage between Queen Elizabeth and the dukes of Anjou and Alençon. On Aug. 2 of the same year the last séance of the old academy was held.

In the first draft of the new institute, Oct. 25, 1795, no class corresponded exactly to the old Academy of Inscriptions; but most of the members who survived found themselves re-elected either in the class of moral and political science, under which history and geography were included as sections, or more generally under the class of literature and fine arts, which embraced an-

cient languages, antiquities and monuments. In 1816 the academy received again its old name. Perhaps the subjects on which it has shown most originality are comparative mythology, the history of science among the ancients, and the geography and antiquities of France. The old academy has reckoned among its members De Sacy the orientalist, Dansse de Villoison (1750-1805) the philologist, Anquetil du Perron the traveller, Guillaume J. de C. L. Sainte-Croix and du Theil the antiquaries, and Le Beau, who has been named the last of the Romans. The new academy included the names of Champollion, A. Rémusat, Raynouard, Burnouf and Augustin Thierry.

In consequence of the attention of several literary men in Paris having been directed to Celtic antiquities, a *Celtic Academy* was established in that city in 1805. It still exists as *La société nationale des antiquaires de France*.

Great Britain.—The British Academy was the outcome of a meeting of the principal European and American academies, held at Wiesbaden in Oct. 1899. A scheme was drawn up for an international association of the academies of the world under the two sections of natural science and literary science, but while the Royal Society adequately represented England in science there was then no existing institution that could claim to represent England in literature. A separate society was therefore formed entitled "The British Academy for the promotion of historical, philosophical and philological studies," which on Aug. 8, 1902, was incorporated by royal charter. The objects of the academy are therein defined: "the promotion of the study of the moral and political sciences, including history, philosophy, law, politics and economics, archaeology and philology." The number of fellows (so all members are entitled) is restricted to 150 and the academy is governed by a president and a council of 15 elected annually by the fellows.

The published *Proceedings of the British Academy* amount already to 12 volumes. Other publications are *Supplemental Papers* (1911, etc.) and the annual *Schweich Lectures* on biblical archaeology, inaugurated in 1908. *The Fund* has also enabled the academy to forward the work of excavation in Bible lands. The series of *Social and Economic Records* under the direction of Sir Paul Vinogradoff was started in 1908, with the support of a Government grant. The publication, by the Clarendon Press, of the facsimile *Old Testament of the Codex Sinaiticus* (1911-22) was made possible by an anonymous gift. The academy has also published a facsimile of the Caedman ms.

In 1908 the academy organized the commemoration of the tercentenary of Milton's birth. It is helped by the foundation of the annual Master Mind lecture (one of a number of endowments, under the will of the late Henriette Hertz). In 1927 it celebrated its 25th anniversary, the hon. secretary, Sir Israel Gollancz, having held uninterrupted office since the beginning. Among other endowments may be mentioned the annual Shakespeare lecture, the annual Raleigh lectures on history, the Warton lecture on English poetry; the Philosophical lecture; the Italian lecture; the lecture on aspects of art; the lecture on English philology and literary history; the Cromer prize for Greek essay; the biennial prize for English studies. The academy administers also the Rose Mary Crawshay prize fund for English literature, an annual prize of £100 awarded to a woman of any nationality for work on English literature.

The school of oriental studies, now an integral part of the University of London, was largely the outcome of a scheme submitted to the academy in 1904 by the late Prof. Rhys Davids. The organization of imperial studies, now recognized in London and in other British universities, was directly due to proposals made by Sir Sidney Low to the academy in 1912. The English Place-Name Society, founded in 1921 to carry out the survey of English place-names, was inaugurated under the auspices of the British academy in 1923, as the result of a statement submitted by Prof. A. Mawer, now director of the society. The foundation of the British School of Archaeology in Jerusalem in 1919 was brought about by the academy, in conjunction with the Palestine exploration fund. The establishment of the British school at Jerusalem must take an important place among the more recent

efforts of the academy. Among its recent excavations are those on the Hill of Ophel at Jerusalem, the results of which confirm the view as to the site of the city of David. Meanwhile remarkable discoveries have been made in the Near East (see *ARCHAEOLOGY: Western Asia*). Among the enterprises promoted by the academy is the *Encyclopaedia of Islam* (1908, etc.).

The academy is closely associated with the newly established Union Académique Internationale. The principal proposals of the Union in which the academy is concerned are the following: (a) *Corpus vasorum* (1922, etc.); (b) *Catalogue of Alchemical mss.* (1926, etc.); (c) *Dictionary of Mediaeval Latin*; (d) *Forma Orbis Romani*; and (e) supplements to the *Corpora Inscriptionum graecarum et latinarum*.

Italy.—The *Accademia Ercolanese* (*Academy of Herculaneum*) was established at Naples about 1755, at which period a museum was formed of the antiquities found at Herculaneum, Pompeii and other places, by the marquis Tanucci. Its object was to explain the paintings, etc., discovered at those places, and for this purpose the members met every fortnight. The first volume of their labours appeared in 1775, and they have been continued under the title of *Antichità di Ercolano*. They contain engravings of the principal paintings, statues, bronzes, marble figures, medals, utensils, etc., with explanations. In the year 1807 an academy of history and antiquities, on a new plan, was established at Naples by Joseph Bonaparte, but the subsequent changes in the political state of Naples prevented the full and permanent establishment of this institution. In the same year an academy was established at Florence for the illustration of Tuscan antiquities, which published some volumes of memoirs.

IV. ACADEMIES OF MEDICINE AND SURGERY

Austria.—The Academy of Surgery at Vienna was instituted in 1784 by the emperor Joseph II. under the direction of the distinguished surgeon, Giovanni Alessandro Brambilla (1728-1800). In 1874 it ceased to exist; its functions had become mainly military and were transferred to newer schools.

France.—Charlemagne is said to have established a school of medicine in the Louvre, and various societies have been founded and privileges granted to the faculty by his successors. The *Académie de médecine* succeeded to the old *Académie royale de chirurgie et société royale de médecine* in 1820. The new academy was divided into three sections—medicine, surgery and pharmacy. In its constitution it closely resembled the *Académie des sciences*.

Germany.—The *Academia Naturae Curiosae*, afterwards called the *Academia Caesaraea Leopoldina*, was founded in 1662 by J. L. Bausch, a physician of Leipzig. The works of the *Naturae Curiosae* were at first published separately; but from 1784 this appeared annually under the title of *Ephemerides*. In 1687 the emperor Leopold took the society under his protection, and its name was changed in his honour. This academy has no fixed abode, but follows the home of its president. Its library remains at Dresden.

V. ACADEMIES OF THE FINE ARTS

France.—The *Académie royale de peinture et de sculpture* at Paris was founded by Louis XIV. in 1648, under the title of *Académie royale des beaux arts*, to which was afterwards united the *Académie d'architecture*, founded 1671. It is composed of painters, sculptors, architects, engravers and musical composers. From among the members of the society who are painters, is chosen the director of the French *Académie des beaux arts* at Rome, also instituted by Louis XIV. in 1677. The director's province is to superintend the studies of the painters, sculptors, etc., who, chosen by competition, are sent to Italy at the expense of the Government, to complete their studies in that country. The *Académie nationale de musique* is the official and administrative name given in France to the grand opera.

Great Britain.—The Royal Academy of Arts in London, founded in 1768, is described in a separate article. (See *ACADEMY, ROYAL*.)

The *Academy of Ancient Music* was established in London in 1710, with the view of promoting the study and practice of vocal and instrumental harmony. About 1734 the academy became a

seminary for the instruction of youth in the principles of music and the laws of harmony. The *Royal Academy of Music* was formed for the performance of operas, composed by Handel and conducted by him at the theatre in the Haymarket. A contest between Handel and Senesino, one of the performers, in which the directors took the part of the latter, occasioned the dissolution of the academy after it had existed with honour for more than nine years. The present *Royal Academy of Music* dates from 1822, and was incorporated in 1830. It instructs pupils of both sexes in music. (See also the article CONSERVATOIRE for colleges of music.)

The *Royal Academy of Dramatic Art* (incorporated in 1920), was originally founded by Beerbohm Tree in 1904. It provides a thorough training for the stage. Like the Royal Academy and the Royal College of Music it receives a grant of £500 a year from the Government. It awards annually certain scholarships, and also prepares for the diploma in dramatic art of London university. A somewhat similar institution is the School of Speech Training and Dramatic Art (incorporated), founded by Miss E. Fogerty, which also prepares for the stage.

Italy.—In 1778 an academy of painting and sculpture was established at Turin. In Milan an academy of architecture was established so early as 1380, by Gian Galeazzo Visconti. About the middle of the 18th century an academy of the arts was established there, after the example of those at Paris and Rome. Before the effects of the French Revolution reached Italy this was one of the best establishments of the kind in that kingdom. The academy of the arts, which had been long established at Florence, fell into decay, but was restored at the end of the 18th century. But the treasures of this and the other institutions for the fine arts were greatly diminished during the occupation of Italy by the French. There are also academies of the fine arts in Mantua, Venice and Naples.

Russia.—The academy of St. Petersburg was established in 1757 by the empress Elizabeth, at the suggestion of Count Shuvalov, and annexed to the academy of sciences. It is now known as the *Akademiya Nauk Soyuza Sovetskikh Socialisticheskikh Respublik*.

South America.—There are several small academies in the various towns of South America, the most important being that of Rio de Janeiro, founded by John VI. of Portugal in 1816 and now known as the *Escola Nacional de Bellas Artes*.

Spain.—In Madrid an academy for painting, sculpture and architecture, the *Academia de Bellas Artes de San Fernando*, was founded by Philip V. The minister for foreign affairs is president. Prizes are distributed every three years. In Cadiz a few students are supplied by the Government with the means of drawing and modelling from figures; and such as are not able to purchase the requisite instruments are provided with them.

Sweden.—An academy of fine arts was founded at Stockholm in the year 1733 by Count Tessin. Such students as display distinguished ability obtain pensions from the Government, to enable them to reside in Italy for some years for the purposes of investigation and improvement. In this academy there are nine professors and generally about 400 students.

Austria.—In the year 1705 an academy of painting, sculpture and architecture was established at Vienna, with the view of encouraging and promoting the fine arts.

See also SOCIETIES, LEARNED.

The volume of excerpts from the general catalogue of books in the British Museum, "Academies," five parts and index, furnishes a complete bibliography. See also *Minerva* published in Berlin and Leipzig and *Index Generalis* published in Paris. (C. Br.)

United States.—The early organization of scholars in America took a form frankly imitative of that prevalent in Europe. Academies were organized in Philadelphia and Boston in the 18th century, which, like their European prototypes, were divided into different classes. Election to membership in them was in recognition of scholarly or scientific attainment, and they still closely resemble their European counterparts.

American scientists and scholars, however, have found their most effective organization in societies and associations of open

membership, described in the article on Learned Societies. These frequently maintain a national headquarters at either Washington, D.C., or New York city, co-ordinate the work of the affiliated societies throughout the United States and even Canada and often issue an annual or quarterly publication, sometimes in addition to a more popular monthly magazine. There are, for example, the Archaeological Institute of America, organized in 1879, and the American Federation of Arts, which was organized in 1909 to further art in the United States by means of lectures, exhibitions and publications. There are, too, many so-called academies, clubs, societies, guilds, leagues and associations devoted to the

BY COURTESY OF AMERICAN PHILOSOPHICAL SOCIETY
ORIGINAL BUILDING AT PHILADELPHIA OF THE AMERICAN PHILOSOPHICAL SOCIETY FOR THE PROMOTION OF USEFUL KNOWLEDGE FOUNDED IN 1727 BY BENJAMIN FRANKLIN

preservation, study and furtherance of the fine arts, the physical and natural sciences, natural scenery and historic landmarks and to the improvement of cities (see *American Art Annual*, v. XXIV., 1927). Finally, there are various Federal, State and municipal art commissions that generally supervise the embellishment of public works.

Of the American organizations the following most nearly approximate the European *academy* as it has been considered here: The American Academy of Arts and Letters was organized in 1904 from within the membership of the National Institute of Arts and Letters. Founded in 1898 by members of the American Social Science Association, the National Institute of Arts and Letters now has a membership limited to 250 and divided into three sections: literature, art and music. To be elected to the Institute a candidate must be proposed by a member of his own group and receive a vote of the majority of his section and later a majority vote of those present at the annual meeting. Its executive office is in the Academy building at 633 West 155th street, New York city. The American Academy of Arts and Letters operates under a Federal charter. It is limited to 50 members, chosen from the membership of the Institute only. Unlike the Institute, it functions as a whole and a literary man is not necessarily elected to fill the chair formerly occupied by a literary man. Apart from the honour conferred by membership, the actual work of the Academy is to promote American literature and art by giving the stamp of its approval of the best that both the past and the present have to offer, by means of public addresses, by bringing to the United States representatives of other Academies and, through conferences and discussion, thereby helping to establish a literary and artistic entente between nations, and through its exhibitions, publications, collections and awards.

The American Academy of Arts and Sciences, Boston, the second oldest scientific society in the United States, was chartered in 1780 by a group of distinguished citizens of Massachusetts, including John and Samuel Adams and John Hancock. The membership is divided into three classes, covering the physical and mathematical, the natural and physiological, and the moral and political sciences. It includes fellows (limited to 600), associates and foreign honorary members, elected on the basis of recognition of scholarship or professional eminence. The academy publishes *Proceedings* and *Memoirs*. It administers various trust funds in aid of physical and chemical research, and awards the Rumford medal to the authors of "any important discovery or useful improvement in light or heat which shall have been made in any part of America." It has a commodious building but no considerable endowment. The library is rich in the fields of physics, chemistry, mathematics and in the publications of learned societies of other countries.

The American Philosophical Society Held at Philadelphia for Promoting Useful Knowledge is the oldest scientific association in the United States. The society is the outgrowth of the Junto founded by Franklin in 1727. In 1743 Franklin published *A Proposal for Promoting Useful Knowledge among the British Plantations in America*, which was so favourably received that in the same year the society was organized, with Thomas Hopkinson (1709-51) as president and Franklin as secretary. In 1769 it united with another scientific society founded by Franklin, called the American Society Held at Philadelphia for Promoting Useful Knowledge, and adopted its present name, adding the descriptive phrase from the title of the American Society, and elected Franklin president, an office which he held until his death (1790). The American Philosophical Society is national in scope and comprehends all departments of learning; its *Transactions* date from 1771, and its *Proceedings* from 1838. It has a hall in Philadelphia with meeting-rooms and a valuable library and collection of interesting portraits and relics. David Rittenhouse was its second and Thomas Jefferson its third president. In 1786 John Hyacinth de Magellan, of London, presented a fund, the income of which was to supply a gold medal for the author of the most important discovery "relating to navigation, astronomy or natural philosophy (mere natural history excepted)."

The National Academy of Sciences (1863) was incorporated by Congress with the object that it "shall, whenever called upon by any department of the Government, investigate, examine, experiment and report upon any subject of science or art." Its membership was first limited to 50; after the amendment of the act of incorporation in 1870 the limit was placed at 100; and in 1907 it was prescribed that the resident membership should not exceed 150 in number, no more than ten members to be elected in any one year, and that the number of foreign associated be restricted to 50. The constitution was later amended to provide that the membership shall not exceed 250 and that not more than 15 members shall be elected at one annual meeting. The academy is divided into ten sections: mathematics, astronomy, engineering, chemistry, geology and palaeontology, botany, zoology and anatomy, physiology and pathology, anthropology and psychology. It gives several gold medals for meritorious researches and discoveries, and holds also a number of small trust funds, from the income of which grants are made for scientific research. It publishes scientific and biographical memoirs, an annual report and monthly proceedings.

The National Academy of Design was founded in 1826 and incorporated in 1828. The first president was Samuel Finley Breese Morse, a portrait painter who subsequently invented the telegraph. The number of "associates" is unlimited but the number of "academicians" is limited to 125 painters, 25 sculptors and 25 architects or engravers. Two exhibitions are given annually and each member is entitled to exhibit one work without approval by the jury of selection.

The American Institute of Architects was chartered in 1857 with Richard Upjohn as president and Richard M. Hunt as secretary. It merged with the Western Association of Architects (founded 1884) in 1889 and has since been national in scope.

Since 1902 admission to membership has required an accredited diploma, or scholarship, or passing an examination either technical or on the candidate's work and standing. An annual convention is held and an annuary and monthly journal are issued.

ACADEMY, GREEK, or ACADEME, the name given to the philosophic school founded by Plato. The name is derived from a pleasure garden or gymnasium situated in the suburb of the Ceramicus on the river Cephissus about a mile to the north-west of Athens from the gate called Dipylum. It was said to have belonged to the ancient Attic hero Academus, who, when the Dioscuri invaded Attica to recover their sister Helen, carried off by Theseus, revealed the place where she was hidden. Out of gratitude the Lacedaemonians, who revered the Dioscuri, always spared the Academy during their invasions of the country. It was walled in by Hipparchus and was adorned with walks, groves, and fountains by Cimon (Plut. *Cim.* 13), who bequeathed it as a public pleasure ground to his fellow citizens. Subsequently the garden became the resort of Plato (*q.v.*) who had a small estate in the neighbourhood. Here he taught for nearly 50 years till his death in 348 B.C., and his followers continued to make it their headquarters. It was closed for teaching by Justinian in A.D. 529 along with the other pagan schools. Cicero borrowed the name for his villa near Puteoli, where he composed his dialogue, *The Academic Questions*.

The Platonic Academy (proper) lasted from the days of Plato to those of Cicero, and during its whole course there is traceable a distinct continuity of thought which justifies its examination as a real intellectual unit. On the other hand, this continuity of thought is by no means an identity. The Platonic doctrine was so far modified in the hands of successive scholars that the Academy has been divided into either two, three or five main sections (Sext. Empir. *Pyrrh. Hyp.* i. 220). Finally, in the days of Philo, Antiochus and Cicero, the metaphysical dogmatism of Plato had been changed into an ethical syncretism which combined elements from the Scepticism of Carneades and the doctrines of the Stoics; it was a change from a dogmatism which men found impossible to defend, to a probabilism which afforded a retreat from Scepticism and intellectual anarchy. Cicero represents at once the doctrine of the later Academy and the general attitude of Roman society when he says, "My words do not proclaim the truth, like a Pythian priestess; but I conjecture what is probable, like a plain man; and where, I ask, am I to search for anything more than verisimilitude?" And again: "The characteristic of the Academy is never to interpose one's judgment, to approve what seems most probable, to compare together different opinions, to see what may be advanced on either side and to leave one's listeners free to judge without pretending to dogmatize."

The passage from Sextus Empiricus, cited above, gives the general view that there were three academies: the first, or Old, academy under Speusippus and Xenocrates; the second, or Middle, academy under Arcesilaus and Polemon; the third, or New, academy under Carneades and Clitomachus. Sextus notices also the theory that there was a fourth, that of Philo of Larissa and Charmidas, and a fifth, that of Antiochus. Diogenes Laertius says that Lacydes was the founder of the New Academy (i. 19, iv. 59). Cicero (*de Orat.* iii. 18, etc.) and Varro insist that there were only two academies, the Old and the New. Those who maintain that there is no justification for the five-fold division hold that the agnosticism of Carneades was really latent in Plato, and became prominent owing to the necessity of refuting the Stoic *criterion*.

The general tendency of the Academic thinkers was towards practical simplicity, a tendency due in large measure to the inferior intellectual capacity of Plato's immediate successors. Cicero (*de Fin.* v. 3) says generally of the Old Academy: "Their writings and method contain all liberal learning, all history, all polite discourse; and besides they embrace such a variety of arts that no one can undertake any noble career without their aid . . . In a word the Academy is, as it were, the workshop of every artist." It is true that these men turned to scientific investigation, but in so doing they escaped from high altitudes in which Plato thought, and tended to lay emphasis on the mundane side of philosophy.

Of Plato's originality and speculative power, of his poetry and enthusiasm they inherited nothing, "nor amid all the learning which has been profusely lavished upon investigating their tenets is there a single deduction calculated to elucidate distinctly the character of their progress or regression" (Archer Butler, *Lect. on Anc. Phil.* ii. 315).

The modification of Academic doctrine from Plato to Cicero may be indicated briefly under four heads.

(1) Plato's own theory of Ideas was not accepted even by Speusippus and Xenocrates. They argued that the Good cannot be the origin of things, inasmuch as Goodness is only found as an attribute of things. Therefore, the idea of Good must be secondary to some other more fundamental principle of existence. This unit Speusippus attempted to find in the Pythagorean number theory. From it he deduced three principles, one for numbers, one for magnitude, one for the soul. The Deity he conceived as that living force which rules all and resides everywhere. Xenocrates, though like Speusippus infected with Pythagoreanism, was the most faithful of Plato's successors. He distinguished three spheres, the sensible, the intelligible, and a third compounded of the two, to which correspond respectively, sense, intellect, and opinion (*δῶξα*). Cicero notes, however, that both Speusippus and Xenocrates abandon the Socratic principle of hesitancy.

(2) Up to Arcesilaus, the Academy accepted the principle of finding a general unity in all things, by the aid of which a principle of certainty might be found. Arcesilaus, however, broke new ground by attacking the very possibility of certainty. Socrates had said, "This alone I know, that I know nothing." But Arcesilaus went farther and denied the possibility of even the Socratic minimum of certainty: "I cannot know even whether I know or not." Thus from the dogmatism of the master the Academy plunged into the extremes of agnostic criticism.

(3) The next stage in the Academic succession was the moderate scepticism of Carneades which owed its existence to his opposition to Chrysippus, the Stoic. To the Stoical theory of *apprehensible* (or *knowable*) *presentation*, by which they expressed a conviction of certainty arising from impressions so strong as to amount to real knowledge, he opposed the doctrine of *inapprehensible* (or *unknowable*) *presentation*, which denied any necessary correspondence between perceptions and the objects perceived. He saved himself, however, from absolute scepticism by the doctrine of probability or verisimilitude, which may serve as a practical guide in life. Thus his criterion of imagination is that it must be credible, irrefutable, and attested by comparison with other impressions; it may be wrong, but for the person concerned it is valid. In ethics he was an avowed sceptic. During his official visit to Rome he gave public lectures, in which he successively proved and disproved with equal ease the existence of justice.

(4) In the last period we find a tendency not only to reconcile the internal divergences of the Academy itself, but also to connect it with parallel growths of thought. Philo of Larissa endeavours to show that Carneades was not opposed to Plato, and further that the apparent antagonism between Plato and Zeno was due to the fact that they were arguing from different points of view. From this syncretism emerged the prudent non-committal eclecticism of Cicero, the last product of Academic development.

For detailed accounts of the Academicians see ARISTOTLE, XENOCRATES, etc., also STOICS and NEOPLATONISM. Histories of philosophy by Erdmann, Zeller, and Windelband, and Th. Gomperz, *Greek Thinkers*, ii. 270 (Eng. trans., 1905).

ACADEMY OF NATURAL SCIENCES OF PHILADELPHIA, THE, was organized in 1812. It has a large library and a museum with several million specimens. The scientific staff of the Academy (1928), includes 12 permanently attached investigators and 15 research associates. The society has published *Journals* since 1817, and *Proceedings* since 1841; it also publishes the *Manual of Conchology* and the *American Journal of Conchology*. The American Entomological Society (in 1859-67 the Entomological Society of Philadelphia, and since 1876 affiliated with this academy) has regularly published its *Proceedings* or *Transactions* since 1861, *Memoirs* since 1916 and the *Entomological News* (a monthly).

ACADEMY, ROYAL. The Royal Academy of Arts in London, to give it the original title in full, was founded in 1768, "for the purpose of cultivating and improving the arts of painting, sculpture and architecture." It was the outcome of many attempts which had previously been made in England to form a society which should have for its object the advancement of the fine arts. No time was lost in establishing the schools, and on Jan. 2, 1760, they were opened at some rooms in Pall Mall, a little eastward of the site now occupied by the Junior United Service club, the president, Sir Joshua Reynolds, delivering on that occasion the first of his famous "Discourses." The opening of the first exhibition at the same place followed on April 26.

The government of the Academy was by the "Instrument" vested in "a president and eight other persons, who shall form a council." Four of these were to retire every year, and the seats were to go by rotation to every Academician. The number was increased in 1870 to 12, and reduced to ten in 1875. The rules as to retirement and rotation are still in force. Newly elected Academicians begin their two years' service as soon as they have received their diploma. The council has, to quote the "Instrument," "the entire direction and management of the business" of the Academy in all its branches, and also the framing of new laws and regulations; but the latter, before coming into force, must be sanctioned by the general assembly of Academicians and approved by the sovereign. The original number of Academicians was fixed in the "Instrument" at 40, and has so remained. Each Academician on his election has to present an approved specimen of his work—called his diploma work—before his diploma is submitted to the sovereign for signature. On receiving his diploma he signs the Roll of Institution as an Academician, and takes his seat in the general assembly. The class of Associates, out of whom alone the Academicians can be elected, was founded in 1769.

One of the most important functions of the Royal Academy, and one which for nearly a century it discharged alone was the instruction of students in art. The first act, as has been shown, of the newly founded Academy was to establish schools—"an Antique Academy," and a "School for the Living Model" for painters, sculptors and architects. A school of painting was added in 1815, and special schools of sculpture and architecture in 1871. The schools consist of an antique school, a school of painting, a school of drawing from the life, a school of modelling from the life and an architectural school. Admission is gained by submitting specimens of drawing or modelling, and the successful candidates, called probationers, have then to undergo a further test in the schools, on passing which they are admitted as students for five years. Female students were first admitted in 1860. There are permanent curators and teachers in all the schools, but the principal teaching is done by the keeper and visitors—Academicians and Associates—elected to serve in each school.

Another of the principal objects to which the profits of the Royal Academy have been devoted has been the relief of distressed artists and their families.

The source from which have been derived the funds for carrying on the varied work of the Royal Academy, its schools, its charities and general cost of administration, and which has enabled it to spend large sums on building, and provided it with the means of maintaining the buildings, has been the annual exhibitions. There is an annual winter exhibition of works by old masters and deceased British artists, and a summer exhibition of works by living artists.

Presidents of the Royal Academy.—Sir Joshua Reynolds, 1768-92; Benjamin West (resigned), 1792-1805; James Wyatt, 1805; Benjamin West (re-elected), 1806-20; Sir Thomas Lawrence, 1820-30; Sir Martin Archer Shee, 1830-50; Sir Charles Lock Eastlake, 1850-65; Sir Francis Grant, 1866-78; Frederic, Lord Leighton of Stretton, 1878-96; Sir John Everett Millais, 1896; Sir Edward John Poynter, Bt., 1896-1918; Sir Aston Webb, G.C.V.O., 1919-24; Sir Frank Dicksee, K.C.V.O., 1924.

The library contains about 11,000 volumes, dealing with the history, the theory and the practice of the various branches of the fine arts, some of them of great rarity and value. It is open daily to the students and members, and to others on introduction.

The trust funds administered by the Royal Academy include the following: The Turner fund, the Creswick fund, the Landseer fund, the Armitage fund, the Leighton bequest and the Edward Stott fund.

BIBLIOGRAPHY.—The literature concerning the Royal Academy consists chiefly of pamphlets and articles of more or less ephemeral value. More serious works are: William Sandby, *The History of the Royal Academy of Arts* (1862) (withdrawn from circulation on a question of copyright); *Report from the Select Committee on Arts and their Connection with Manufactures, with the Minutes of Evidence and Appendix* (1836); *Report of the Royal Commission on the Royal Academy, with Minutes of Evidence and Appendix* (1863); Martin Archer Shee, *The Life of Sir M. A. Shee, P.R.A.* (1860); C. R. Leslie, R.A., and Tom Taylor, *Life and Times of Sir Joshua Reynolds, P.R.A.* (1865); J. E. Hodgson, R.A., and F. A. Eaton, Sec. R.A., *The Royal Academy and its Members, 1768-1830* (1905). But the chief sources of information on the subject are the minute-books of the council and of the general assembly, and the annual reports, which, however, only date from 1859. (F. A. E.; W. R. M. L.)

ACADIA or **ACADIE**, a district in what is now Nova Scotia and eastern New Brunswick, so named either because Verrezano (*q.v.*) called a part of the coast *Arcadia* in 1524, or from the Micmac *acadie*, fertile land, found in several place-names. Visited by Champlain in 1603 and by De Monts in 1604, and colonized by France, Acadia was a bone of contention in the wars between France and England. It became English under the treaty of Utrecht in 1713. In 1755 the inhabitants, numbering about 3,000 were deported by the English, who suspected their loyalty. This deportation is the theme of Longfellow's *Evangeline*. The Acadians were distributed among the English colonies. One party made its way to Bayou Teche, Louisiana, where Cable has described their modern life. After the peace of 1763, about 800 returned to New Brunswick, where the name *Acadien* is still current.

See G. P. Bible, *An Historical sketch of the Acadians* (1892); H. F. Graham, *The Acadian Exile* (1919).

ACAJUTLA, a Pacific port of Salvador, Central America, terminus of the British-owned Salvador railroad, and coffee-shipping centre for the republic. The population is about 1,000, and the port an open roadstead, passengers and freight being handled by lighters. The town is 65m. distant from San Salvador and 12m. from Sonsonate.

ACANTHOCEPHALA, a group of cylindrical, parasitic worms, often included with the Nematoda and Nematomorpha in a phylum Nemathelminthes, but of very doubtful affinities.

There is no mouth or alimentary canal, but a retractile proboscis, contained in a muscular sac and armed with recurved hooks for attachment to the host. The body-wall consists of (1) a cuticle; (2) a syncytial subcuticular layer containing few nuclei and traversed by branching vessels containing fluid; (3) a layer of circular muscle fibres; and (4) a slight layer of longitudinal muscle fibres. Connected with the base of the proboscis are a pair of sac-like organs called the lemnisci. The nervous system consists of a central ganglion in the proboscis-sac, giving off nerves to the proboscis and body. Excretory organs in the form of a pair of branching nephridia have been described in certain species and these organs are connected by canals with the vagina or ejaculatory duct.

The sexes are separate, the reproductive organs in both being supported by a "ligament" which runs from the proboscis-sac to the posterior end of the body. The male has paired testes and several pairs of "cement glands," connected with the ejaculatory duct, which opens into a protrusible "bursa copulatrix." In the female, the ova are discharged in masses from the ovary into the fluid of the body-cavity, where fertilization and segmentation take place. Connected with the vagina is a structure known as the "bell," which selects the ripe eggs and passes them into the uterus, returning immature ova to the body-cavity. The genital aperture is at the posterior end of the body.

The adult worms live in the intestine of vertebrates, the ova escaping with the faeces of the host. The larval forms are found encapsulated in the body-cavity of some animal (usually a crustacean, insect or lower vertebrate) liable to be eaten by the final host. For example, the larvae of the large *Macracanthorhynchus hirudinaceus* (*Echinorhynchus gigas*) of the pig occur in the

FROM CAMBRIDGE NATURAL HISTORY VOL. II., BY PERMISSION OF MACMILLAN & CO., LTD. A LENGTHWISE SECTION THROUGH THE BODY OF A MALE ACANTHOCEPHALUS (*NEOECHINORHYNCHUS RUTILI*). FROM CAMBRIDGE NATURAL HISTORY, VOL. II., "WORMS, ROTIFERS AND POLYZOA"

The Acanthocephala are a group of worms parasitic in the intestines of vertebrates. Their young stages are found in the body-cavity of some animal liable to be eaten by the final host. Thus the larvae of a species found in the pig occur in the grubs of the cockchafer and rose-beetle

grubs of the cockchafer and rose-beetle. Some 35 genera of Acanthocephala are recognized, and variously arranged by different authors in from four to as many as eight families.

(H. A. B.)

ACANTHOPTERYGII, the most specialized section of the bony fishes (Teleostii), characterized by the possession of spines on the first dorsal fin and by the absence usually of a duct connecting the air-bladder with the alimentary canal. (See FISH.) They include the perch, the mackerel, the bass (*qq.v.*) and other well known and important fishes besides numerous less noteworthy forms. In the perches and basses the anterior dorsal fin is armed with formidable spines.

ACANTHUS, a genus of plants of the acanthus family (Acanthaceae), embracing some 20 species, mainly perennial herbs and small shrubs, native to the Mediterranean region and the warmer parts of Asia and Africa. They are bold, vigorous, handsome plants, with mostly broad, much divided, often spiny-toothed leaves. The erect stems bear stately spikes of showy white, purple or red flowers, surrounded by sharp-pointed, sometimes highly coloured bracts. Several species are grown as ornamentals. These are mostly thistle-like plants, with stems 3 ft. to 4 ft. high, the best known of which is the bears' breech or brankursine (*A. mollis*), common in Mediterranean countries, with deeply cut, hairy, shining leaves, which are without spines, and whitish or rose-coloured flowers in spikes 1½ ft. long. The spiny acanthus (*A. spinosus*), native to southern Europe, is so named because of its very spiny leaves. *A. Parringi*, a native of Asiatic Turkey, with red flowers, is suitable for rock gardens. *A. montanus*, native to Greece, with roseate flowers, is grown in greenhouses.

In architectural decoration, the acanthus was first reproduced

BY COURTESY OF THE MEXICO CITY "EXCELSIOR"

THE HARBOUR OF ACAPULCO, THE BEST ON THE PACIFIC COAST OF MEXICO, IS SAID TO BE THE THIRD LARGEST IN THE WORLD. THE CITY, SITUATED ON A DEEP, SEMICIRCULAR BAY, ALMOST LAND-LOCKED, IS BUILT ON A NARROW STRIP OF LOW LAND, SCARCELY A HALF-MILE WIDE, BETWEEN THE SHORE LINE AND THE LOFTY, ENCIRCLING MOUNTAINS

in metal, and subsequently carved in stone by the Greeks. It was afterwards, with various changes, adopted in all succeeding styles of architecture as a basis of ornamental decoration. There are two types, that found in the *Acanthus spinosus*, which seems to have been followed by the Greeks, and that in the *Acanthus mollis*, which seems to have been preferred by the Romans.

BY COURTESY OF BÜHLMANN, "CLASSIC AND RENAISSANCE ARCHITECTURE" (NEFF AND HELBURN); D'ESPLOY, "FRAGMENTS D'ARCHITECTURE ANTIQUE" (CH. MASSIN ET CIE)

A CAPPELLA or **ALLA CAPPELLA**, Italian musical terms meaning literally "as in a chapel or church," whence they have come to be applied to compositions intended to be sung without instrumental accompaniment; or, alternatively, compositions accompanied in a particular way, viz., without the introduction of harmony or parts.

A CAPRICCIO, in music a direction signifying that the piece to which it is attached is of a fanciful, capricious nature, and is to be played in like manner.

ACAPULCO, a city and port of the State of Guerrero on the Pacific coast of Mexico, 190m. S.S.W. of the city of Mexico. Its population in 1900 was 4,932, and in 1921 5,768. It is situated on a deep, semicircular bay, almost land-locked, easy of access and with so secure an anchorage that vessels can safely lie alongside the rocks that fringe the shore. It is the best harbour on the Pacific coast of Mexico, and it is a port of call for steamship lines running between Panama and San Francisco. The town is built on a narrow strip of low land, scarcely half a mile wide, between the shore line and the lofty mountains that encircle the bay. There is great natural beauty in the surroundings, but the mountains render the town difficult of access from the interior, and give it an exceptionally hot and unhealthy climate. The effort to admit the cooling sea breezes by cutting through the mountains a passage called the Abra de San Nicolás had some beneficial effect. Acapulco was long the most important Mexican port on the Pacific, and the only depot for the Spanish fleets plying between Mexico and Spain's East Indian colonies. The town has no railway connection but the old Acapulco-Mexico city road has been rebuilt (1927) and made fit for automobile traffic. The town suffered considerably from earthquakes in July and August 1909.

There are exports of hides, cedar and fruit, and the adjacent district of Tabares produces cotton, tobacco, cacao, sugar cane, Indian corn, beans and coffee.

ACARNANIA, a district of ancient Greece, bounded on the west by the Ionian sea, on the north by the Ambracian gulf, on the east and south by Mt. Thyamus and the Achelous. Its most populous region was the plain of the Achelous, commanded by the principal town Stratus; its people long continued in semi-barbarism, communication with the rest of Greece being impeded by mountain ridges and lagoons, but there were a few Corinthian colonies on the coast, founded in the 7th century B.C.; they were ruined in the 5th, through Athenian intervention. In 391 the Acarnanians submitted to Spartan control; in 371, to Theban. In the Hellenistic age they were constantly assailed by their Aetolian neighbours. But they remodelled their ancient cantonal league, apparently after the pattern of Aetolia, and in the 3rd century they formed a close alliance with Philip V. of Macedonia in his Roman wars. For their sympathy with his successor Perseus they were deprived of their federal capital Leucas and required to send hostages to Rome (167 B.C.). The country was desolated by Augustus, who drafted its inhabitants into Nicopolis and Patrae. Acarnania took a prominent part in the national uprising of 1821; it is now joined with Aetolia as a province. Several ancient sites in Acarnania have well-preserved walls, especially Stratus, Oeniadae and Limnaea.

ACARUS (äk'ä-rus), a genus of Arachnids, represented by the cheese mite and other forms. (See ARACHNIDA.)

ACASTUS, son of Pelias, but the friend of Jason; he took part in the Calydonian boar-hunt and the Argonautic expedition. After his father's death he instituted splendid funeral games in his honour. His wife Astydameia (called Hippolytē in Horace, *Odes* iii. 7, 17) fell in love with Peleus (q.v.), who had taken refuge at Iolcus, and accused him falsely to her husband (cf. BELLEROPHON, HIPPOLYTUS). Acastus thereupon left Peleus asleep on Mount Pelion, having first hidden his famous sword. On awaking, Peleus was attacked by the Centaurs, but saved by Cheiron. Having recovered his sword he returned to Iolcus and slew Acastus and Astydameia.

ACATALEPSY. In the history of philosophy the Greek term *acatalepsy* was first used by Pyrrho the sceptic to express the view that the human mind has no direct apprehension of material objects. One is consequently not justified in making assertions about what things really are in themselves. Each person can only say how things appear to him.

ACAULESCENT, a term used of a plant apparently stemless, as dandelion, the stem being almost suppressed.

ACCADIAN, an adjectival form of the name Accad or Akkad. Sumer and Akkad were the principal sub-regions of Babylonia (q.v.) and in view of the dialectical and ethnological differences between the peoples of the two regions, the terms Sumerian and Accadian came to represent the languages and ethnic groups of the two regions. (See SUMERIAN LANGUAGES.)

ACCA LARENTIA, in Roman legend, the wife of the shepherd Faustulus, who saved the lives of Romulus and Remus. Attempts have been made to explain the wolf-legend by suggesting that Larentia was called *lupa* ("courtesan," literally "she-wolf") on account of her immoral character (Livy i. 4; Ovid, *Fasti*, iii. 55). According to another account, Larentia was a beautiful girl whom Hercules won at dice (Macrobius i. 10; Plutarch, *Romulus*, 4, 5, *Quaest. Rom.*, 35; Aulus Gellius vi. 7). By his advice she married a wealthy Etruscan named Tarutius. She inherited his property and bequeathed it to the Roman people, who instituted in her honour a yearly festival called Larentalia (Dec. 23). According to some, Acca Larentia was the mother of the Lares, and symbolized the fertility of the earth—in particular the city lands and their crops.

See Mommsen, "Die echte und die falsche Larentia," in *Römische Forschungen*, ii. (1879); E. Pais, *Ancient Legends of Roman History* (Eng. trans. 1906), whose views on the subject are criticized by W. W. Fowler in W. H. D. Rouse's *The Year's Work in Classical Studies* (1907); C. Pascal, *Studi di antichità e Mitologia* (1896).

ACCELERANDO (Ital.), in music a direction signifying that the *tempo*, or speed of performance, is to be quickened.

ACCELERATION, as used in mechanics, a term denoting the rate of change in the velocity of a moving body. It is what the increment in velocity in a unit of time would be if the rate of change were uniform for that unit. When a body falls in a vacuum near the earth's surface, the increment in velocity is about 32.16ft. per second, and this is known as the acceleration of gravity. In astronomy the term has other uses, as when it refers to the time which the stars gain upon the sun in passing the meridian each day. (See MECHANICS; UNITS, DIMENSIONS, OF GRAVITATION.)

ACCELERATOR, in a motor-car (*q.v.*) the pedal which operates the throttle and thus controls the engine speed.

ACCELEROMETER. This instrument consists essentially of an elastic cantilever (*q.v.*) loaded at its free end. Accelerations perpendicular to the cantilever produce a deflection. One type consists in a semicircular glass fibre fixed at both ends, the mass centre being situated in the middle of the arc; this instrument measures accelerations normal to the plane of the semicircle. The *air-speed recording accelerometer* is a combination of the foregoing with a diaphragm gauge in connection with the Pitot and static tubes (see AERIAL NAVIGATION), and is used to deduce the flight-path of an aircraft.

ACCENT, a term used by the earlier Greek grammarians for the musical accent which characterized their own language, but later the term became specialized for quantity in metre, whence comes the Eng. *prosody* (Lat. *accentus*, a literal translation of Gr. *προσῳδία*). In all languages there are two kinds of accent: (1) musical chromatic or pitch accent; (2) emphatic or stress accent. The former indicates differences in musical pitch between one sound and another in speech, the latter the difference between one syllable and another which is occasioned by emitting the breath in the production of one syllable with greater energy than is employed for the other syllables of the same word. These two senses are different from the common usage of the word in the statement that someone talks with a foreign or with a vulgar accent.

In different languages the relations between pitch and stress differ very greatly. The pitch accent is well-marked, for example in Lithuanian and Swedish. Modern Greek has changed from pitch to stress, the stress being generally laid upon the same syllable in modern as bore the pitch accent in ancient Greek. In the majority of European languages, however, stress is more conspicuous than pitch. To the existence of stress in the original language from which Greek, Latin, Celtic, Teutonic, Slavonic and other languages of Europe are descended, must be attributed a large part of the phenomena known as ablaut or gradation. In modern languages we get *Acton* out of the O.E. *āc-tūn* (oak-town), and more recently the contrast between *New Town* and *Newton*. The strong stress accent existing in the transition period between Latin and French led to the curtailing of long Latin words like *latrocinium* or *hospitāle* into the words which we have borrowed from French into English as *larceny* and *hotel*.

In both pitch and stress accent different gradations may be

observed. In pitch, the accent may be uniform, rising or falling. Or there may be combinations of rising and falling or of falling and rising accents upon the same syllable. In ancient Greek there were (1) the acute (´), a rising accent; (2) the grave (`), apparently merely the indication that in particular positions in the sentence the acute accent is not used where it would occur in the isolated word; and (3) the circumflex, which, as its form (^) shows, and as ancient grammarians state, combines the rising and the falling accent upon the same syllable, this syllable being always long. Different Greek dialects varied the syllables of the word: in historical times the accent had become limited to the last three syllables of a word. The theory that, as every vowel has its own natural pitch, and a frequent interchange between *e* (a high vowel) and *o* (a low vowel) occurs in the Indo-European languages, *e* originally went with the highest pitch accent, while *o* appeared in syllables of a lower pitch, has no certain foundation, as there are many exceptions. Somewhat similar distinctions characterize stressed syllables. According as the strength of the expiration is greatest either at the beginning, the end or the middle of the syllable, the accent is a falling, a rising, or a rising and falling one. Syllables in which the stress is produced continuously whether increasing or decreasing are called single-pointed, those in which a variation in the stress occurs without being strong enough to break the syllable into two are called double-pointed. There is no separate notation for stress accent, but the acute (´) is used for the increasing, the grave (`) for the decreasing stress, the circumflex (^) for the rising and falling (increasing and decreasing) and (˘) for the opposite. A separate notation is needed.

The relation between the two accents in the same language at the same time is a subject which requires further investigation. In prehistoric times the stress in Latin must have rested upon the first syllable in all cases. Only on this hypothesis can be explained forms like *peperci* (perfect of *parco*) and *collido* (a compound of *laedo*), for throughout the historical period the stress rested in these words upon the second syllable from the end.

Besides the accent of the syllable and of the word, there remains a more complicated problem, the accent of the sentence. From earliest times some words have become parasitic or enclitic upon other words. Pronouns more than most words are modified from this cause, but conjunctions like the Gr. *τε* ("and"), the Lat. *que*, have throughout their whole history been enclitic upon the preceding word. A very important word may be enclitic, as in English *don't*, *shan't*.

The books of Sievers and Jespersen give (esp. Sievers) full refs. to the literature of the subject. For the accent system of Indo-Eur. languages see "Betonung" in Brugmann's *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen*, vol. i. (1897) or, with considerable modifications, his *Kurze vergleichende Grammatik der indogermanischen Sprachen* (1902), §§ 32–65 and 343–350.

ACCEPTANCE, generally, a receiving or acknowledgment of receipt; in law, the act by which a person binds himself to comply with the request contained in a *bill of exchange* (*q.v.*), addressed to him by the drawer. Acceptance may be either general or qualified. A *general* acceptance is an engagement to pay the bill strictly according to its tenor, and is made by the drawee subscribing his name, with or without the word "accepted," at the bottom of the bill, or across the face of it. *Qualified* acceptance may be a promise to pay on a contingency occurring, e.g., on the sale of certain goods consigned by the drawer to the acceptor. No contingency is allowed to be mentioned in the body of the bill on pain of rendering the bill non-negotiable. But a qualified acceptance is quite legal, and equally binding with a general acceptance upon the acceptor when the contingency has occurred. It is also a qualified acceptance where the promise is to pay only part of the sum mentioned

in the bill, or to pay at a different time or place from those specified. As a qualified acceptance is so far a disregard of the drawer's order, the holder is not obliged to take it; and if he chooses to take it he must give notice to antecedent parties, acting at his own risk if they dissent. A bill can be accepted in the first instance only by the person or persons to whom it is addressed; but if he or they fail to do so, it may, after being protested for non-acceptance, be accepted by some one else "*supra* protest," for the sake of the honour of one or more of the parties concerned in it, and he thereupon acquires a claim against the drawer and all those to whom he could have resorted.

For *acceptance of an offer*, see **CONTRACT**.

Acceptance has a further technical meaning in law in the case of delivery of goods pursuant to a prior contract for sale. Either an expression by the buyer of his assent to become owner, or his doing of some act inconsistent with the seller's ownership—such as selling or using part of the goods, will constitute such an acceptance. The effect is, in English law, to make impossible the later rejection of the goods, and leave the buyer a remedy in damages for any non-compliance of the goods with the contract. In some American States the acceptance, at least if not accompanied by an express claim of non-compliance, will wholly bar the buyer from any later claim that the goods were not up to contract. Under the prevailing American doctrine laid down in the Uniform Sales Act, however, the buyer can at his option if the goods accepted do not comply, either have damages, or return the goods and forego damages. If the contract is oral and no part payment has been made, both delivery and acceptance of some portion of the goods are necessary to make the contract enforceable at all. (X.)

United States.—In the United States trade acceptances are rediscountable at the Federal Reserve Bank if the date of maturity be not more than 90 days from the date offered for discount, except in the case of agricultural paper, for which the limit is 180 days. The Federal Reserve Bank shall take such steps as it deems necessary to satisfy itself as to the eligibility of any trade acceptance offered for rediscount and may require a recent financial statement of one or more of the parties to the instrument. To satisfy itself that the acceptance meets the primary requirement of arising out of a current merchandise transaction, the Federal Reserve Bank rules that "it must bear on its face or be accompanied by evidence satisfactory to the Federal Reserve Bank that it was drawn by the seller of the goods on the purchaser of such goods." Such evidence may consist of a certificate on or accompanying the acceptance to the following effect: *The obligation of the acceptor of this bill arises out of the purchase of goods from the drawer.* Such certificate may be accepted by the Federal Reserve Bank as sufficient evidence, provided, however, that the Federal Reserve Bank, in its discretion, may inquire into the exact nature of the transaction underlying the acceptance.

By the use of the trade acceptance, the seller of goods instead of having merely an open book account on a credit transaction, procures a negotiable evidence of the debt. The actual conversion of the original draft into a trade acceptance is accomplished when the buyer (drawee) writes across its face the word "accepted," together with the date and the place of payment, either at a banking house or at the place of business of the seller (drawer), and affixes his signature. Upon receipt of the accepted draft, the seller of goods (drawer) may either hold it to maturity and then collect, or discount it to procure immediate funds.

Authoritative information on current usage in connection with trade acceptances is published from time to time in the *Federal Reserve Bulletin* under "Rulings of the Federal Reserve Board" and "Opinions of Counsel of the Federal Reserve Board." (J. H. B.)

ACCEPTILATION, in Roman and Scots law, a verbal release of a verbal obligation. This formal mode of extinguishing an obligation contracted verbally received its name from the book-keeping term *acceptilatio*, entering a receipt, *i.e.*, carrying it to credit. The words conveying the release had to correspond to, or strictly cover, the expressed obligation.

ACCESS, approach, or the means of approaching. In law, the word is used in various connections. The presumption of a

child's legitimacy is negatived if it be proved that a husband has not had access to his wife within such a period of time as would admit of his being the father. (See **LEGITIMACY**.)

In the law of easements (see **EASEMENT**), every person who has land adjoining a public road or a public navigable river has a right of access to it from his land. So, also, every person has a right of access to air and light through an ancient window. For the right of access of parents to children under the guardianship of the court, see **INFANT**.

ACCESSION, in law, a method of acquiring property adopted from Roman law, by which, in things that have a close connection with or dependence on one another, the property in the principal draws after it the property in the accessory, according to the principle, *accessio cedet principali*. Accession may take place either in a natural way, such as the growth of fruit or the birth of animals, or in an artificial way. The various methods may be classified as (1) land to land by accretion or alluvion (*q.v.*), (2) movables to land (see **FIXTURES**); (3) movables to movables; (4) movables added to by the art or industry of man; this may be by specification, as when wine is made out of grapes, or by confusion, or commixture, which is the mixing together of liquids or solids, respectively. In the case of industrial accession ownership is determined according as the natural or manufactured substance is of the more importance, and, in general, compensation is payable to the person who has been dispossessed of his property.

In a historical or constitutional sense, the term "accession" is applied to the coming to the throne of a dynasty or line of sovereigns or of a single sovereign. "Accession" sometimes likewise signifies consent or acquiescence. Thus, in the bankruptcy law of Scotland, where there is a settlement by a trust-deed, it is accepted on the part of each creditor by a "deed of accession."

ACCESSORY, a person concerned in the commission of a felonious offence, not as principal, but by participation; as by advice, command, aid or concealment. In certain crimes there can be no accessories, all concerned being principals, whether present or absent at the time of their commission. There is no accessory to misdemeanor.

There are two kinds of accessories—*before* the fact and *after* it. The first is he who commands or procures another to commit felony and is not present himself; for if he be present he is an abettor (*q.v.*). The second is he who, knowing a man has committed a felony, receives, harbours or assists him. An accessory before the fact is liable to the same punishment as the principal; and there is now indeed no practical difference between such an accessory and a principal in regard either to indictment, trial or punishment. Accessories after the fact are in general punishable with imprisonment (with or without hard labour) for a period not exceeding two years. (See the Accessories and Abettors Act 1861.)

ACCIACCATURA, in music, an old type of ornament in pianoforte and organ playing which consisted in reinforcing a particular note by striking simultaneously with it the note below it, the latter being then immediately released. (From Ital. *acciacatura*, to crush.) Nowadays it is more often applied to the shorter kind of *appoggiatura* (*q.v.*).

ACCIAJUOLI, DONATO (1428–1478), Italian scholar, was born at Florence and became gonfalonier of the city in 1473. His works are: a Latin translation of some of Plutarch's *Lives* (Florence, 1478); Commentaries on Aristotle's *Ethics* and *Politics*; and lives of Hannibal, Scipio and Charlemagne. In the work on Aristotle he had the co-operation of his master Argyropulos.

ACCIDENCE, the term for the grammatical changes to which words are subject in their inflections as to gender, number, tense and case (a mis-spelling of "accidents," from the Latin neuter plural *accidentia*, casual events). Also used for a book containing the rudiments of grammar, and so of any subject of art.

ACCIDENT. This term has a perplexing variety of meanings, which are, however, not entirely disconnected when considered historically. The meaning of the term varies with the antithesis intended. To this, accordingly, attention must be paid

in any context in which "accident" occurs. The following account deals with the principal antitheses and attempts to indicate the way in which the term "accident" acquired its various meanings.

(1) *Accident and Substance*.—Perhaps the oldest use of the term "accident" was by way of contrast with the term "substance" or "thing." "Substance" means the basic reality which has various qualities, stands in various relations, etc. These qualities, relations, etc., on the other hand, need a basis or support to qualify—they are "accidents," accessions to something that is there to bear them (substance). Among the schoolmen, accordingly, almost any quality was commonly called an accident; and this usage was fairly common even in the 17th century—"accident" and "substance" corresponding roughly to "quality" and "thing" respectively, as these terms are commonly used.

(2) *Accident and the Self-existing*.—In the strict sense of the term, as distinguished from its more usual meaning even among philosophers, the term "substance" means that which exists in itself and through itself, and when so interpreted its familiar contrast with "accident" naturally prompts the application of the term "accident" to *anything* that is dependent on some other thing. In this case, even what are commonly called "things" or "substances" will be classed among "accidents." Thus for Spinozism there is only one Substance, namely God, who alone is self-existing, while all finite things and even the so-called "infinite modes" (such as motion) are really "accidents," or dependent existents. Cartesianism, too, made this admission, or one very like it to all intents and purposes, but allowed the name "substance," in a qualified sense (that is, in the popular sense) to finite bodies and to souls.

(3) *Real Accidents*.—The antithesis between "accident" and "substance" just explained (2), clearly cuts across the distinction between "quality" and "thing," with which, according to one usage, it coincided more or less (1). Now, some of the schoolmen maintained that there are certain sense-qualities of things which are not dependent on the substances with which they are sometimes combined, but can exist by themselves, apart from such substances. These alleged independent or self-existing qualities they called "real accidents."

(4) *Accident and Essence*.—The distinctions between "substance" and "accident" explained in (1) and (2) naturally led people to regard an "accident" as something less important than substance, as something not *essential* to substance; and so the term "accident" was contrasted with whatever is not really essential to anything. Thus in logic, for instance, the so-called *fallacy of accident* is the erroneous assumption that a claim to know anything or anybody implies a knowledge even of all that is non-essential in relation to it or him. Similarly, in the doctrine of the Predicables (*q.v.*), as commonly expounded in books on logic, the predicable "accident" is contrasted with the other four predicables in the sense that any predicate asserted of a subject but not essential to it is called an "accident" of it, whereas any predicate essential to the subject of which it is affirmed belongs to one or other of the remaining predicables.

(5) *Accident, Necessity and Design*.—The kinship between what is "essential" and what is "necessary" has prompted the common use of "accident" for what is otherwise called a "chance" occurrence. And by a somewhat similar extension of its meaning the term "accident" has come to be applied in law to any occurrence or result that could not have been foreseen by the agent (because not necessarily involved in his action), or to a result not designed (and, therefore, presumably not foreseen), and lastly, to anything unexpected.

(6) *"Essential" and "Accidental" Accidents*.—One curious consequence of the multiplicity of meanings of "accident" is that by using the noun in the sense explained in (1) and the adjective in the sense explained in (4) the schoolmen distinguished between "essential" accidents and "accidental" accidents (*i.e.*, qualities).

ACCIDENTALISM, a term used (1) in philosophy for any system of thought which denies the causal nexus and maintains that events succeed one another haphazard or by chance (not in the mathematical but in the popular sense). In metaphysics, accidentalism denies the principle of universal causation, that is, the

doctrine that everything occurs or results from a definite cause. In this connection it is synonymous with Tychism, a term used by C. S. Peirce for the theories (like that of Plato, *e.g.*) which make chance an objective factor in the process of the universe. Opponents of this accidentalism maintain that what seems to be the result of chance is in reality due to a cause or causes which, owing to the lack of imagination, knowledge or scientific instruments, we are unable to detect. In ethics the term is used, like indeterminism, to denote the theory that mental change cannot always be ascribed to previously ascertained psychical states, and that volition is not causally related to the motives involved. An example of this theory is the doctrine of the *liberum arbitrium indifferetiae* (liberty of indifference), according to which the choice of two or more possibilities is affected neither by contemporaneous data of an ethical or prudential kind nor by crystallized habit (character). (2) In painting, the term is used for the effect produced by accidental lights (Ruskin, *Modern Painters*, I. ii. 4, iii., §4, 287). (3) In medicine, it stands for the hypothesis that disease is only an accidental modification of the healthy condition, and can, therefore, be avoided by modifying external conditions.

ACCIDENTALS, in music, are signs signifying that the notes to which they are attached have to be raised, lowered, or restored to their original pitch as the case may be. Thus a sharp (#) raises a note a semi-tone, a flat (b) lowers it a semi-tone, while a natural (n) restores it once again to its former status. Each sign may also be doubled, though in the case of the double sharp, signifying the raising of the note by two semi-tones, the sign X is used instead of ##; bb, indicating a double flat, signifying the lowering of the note by two semi-tones; and bb serving to correct or cancel a preceding double-sharp or double-flat, although in modern practice a single natural (n) is usually considered sufficient for this purpose. Accidentals introduced in the course of a piece apply only during the bar in which they occur, whereas when placed at the beginning of a composition, and constituting thereby what is called its signature, they govern the notes affected throughout the whole of the piece; but in the latter case they are not properly called accidentals. For an explanation of the origin and application of the signs employed for accidentals, *see* under **MUSICAL NOTATION**.

ACCIDENT INSURANCE, PERSONAL. This class of insurance dates from the industrial revolution of the last century and was introduced in consequence of the frequency of railway accidents. Under English law, in insurance there are certain primary principles to be observed. First, there is the principle of "the utmost good faith" (*uberrima fides*), which must always exist if the contract as between the insured and the insurers is to be maintained. The proposer must not withhold from the insurers any fact or circumstance which in anyway affects the risk to be undertaken and, to emphasize this principle, an exact copy of the proposal form completed by the applicant is endorsed on the policy. Whilst it is impossible strictly to apply the principle of indemnity to personal accident insurance, it being obviously impossible to indemnify for loss of life or limbs or eyesight, nevertheless it is not permissible for an insured to provide for weekly benefits greatly in excess of his normal weekly earnings, as this might prove an incentive to lengthen a period of disability. It is a condition of a personal accident policy that the insured shall not, without the consent of the insurers, effect further policies with other companies and at the outset any such additional insurances must be disclosed, though this restriction does not apply to coupon insurances. Prior to the passing of the Fatal Accidents (Damages) Act, 1908, payments under accident policies were generally applied to the reduction of damages payable by a negligent third party, but this is no longer the case.

In all classes of insurance the insurers have to contend both with the physical and moral hazards. By the former, in personal accident insurance, is meant the abnormal risk of accident due to physical defects of the individual, whilst the moral hazard relates to the individual's moral character in so far as he may endeavour to defraud the insurers either by misstatement of facts or by presenting fraudulent claims.

Accidents-only Policies.—The commonest form of policy is that which covers accidents only, and for this class of insurance the occupation of the proposer is of the utmost importance. Preferential rates are quoted for professional men, whilst occupations involving manual employment with only slightly greater hazards warrant an increased premium, as do persons engaged in manual labour and using tools. The proposal form also requires particulars, *inter alia*, as to the height and weight of the proposer, as these factors, together with previous accident experience, must influence an underwriter in his estimation of the risk. Abnormality in these directions may render it necessary to refuse the proposal.

The policy states that the insurers will pay the benefits specified following "accidental bodily injury caused solely and directly by violent external and visible means." These words are used in their ordinary meaning, and when it has been necessary to refer cases to the courts it has always been shown that, provided the occurrence causing the accident has been something which was neither expected nor designed, then the expression "accidental" has been fulfilled. There must, however, be some sign of violence and there must also be a visible effect produced upon the person concerned. The benefits provided by such a policy are in the event of:—

- | | |
|---|------------------------------|
| (1) Death | The capital sum. |
| (2) Total loss by actual physical separation at or above the ankle or wrist of two limbs, or the loss of sight of both eyes, or the loss of one limb and the loss of sight of one eye | The capital sum. |
| (3) Total loss as in (2) of one limb or the sight of one eye | One-half of the capital sum. |

The above misfortunes must occur within three calendar months of the happening of the accident.

- (4) Temporary total disablement from engaging in or giving attention to the insured's occupation. Corresponding weekly benefit.
 (5) Temporary partial disablement in similar circumstances. . . . One-third or one-quarter of benefit under (4).

The liability for the weekly payments is limited to 26 or 52 weeks, as the case may be, in respect of any one year of insurance. When one of the capital sums is payable no claim can be made for weekly compensation and if a payment has already been made for weekly compensation which is followed by a misfortune warranting a capital payment the total liability of the insurers cannot exceed the latter sum.

Accidents and Specified Diseases Policies.—Accidents-only policies were soon followed by a demand for policies covering diseases and insurances are freely issued covering certain specified diseases, for which weekly benefits are provided. The accident benefits are similar to those mentioned above, though the insured is given the advantage of double benefits if he is killed or injured in an accident to a passenger lift, train, tramcar, omnibus or other licensed vehicle plying in the streets for public hire in which he is travelling as a passenger. If the injury, whilst not warranting the payment of one of the capital sums, results in total disablement for a period of not less than 12 months an annuity is payable so long as the disability continues. A similar annuity is provided should the insured lose completely and irrecoverably the sight of both eyes by disease, or should he contract paralysis involving permanent loss of power in at least two limbs, and provided that this condition has existed for at least six months. Such policies remain in force wherever the insured may reside in the world as regards the accidents cover, but so far as the diseases are concerned the cover is restricted to civilized regions.

Many insurers offer bonus additions to the capital sums insured without additional premium and such sums are increased annually by 5% during the continuance of the policy till the original sums are increased by 50%. Reductions from the renewal premiums are often allowed up to 10%, whilst in addition bonuses are given to life policy holders and sometimes to total abstainers. On the payment of an additional premium, usually 10%, medical expenses, including operation fees and hospital charges, may be covered, subject to a reasonable limit.

Accidents and All Sickness Policies.—Such policies are similar to those previously described, but in addition weekly pay-

ments are made to the insured if, as a result of any illness necessitating treatment by a qualified medical practitioner giving a certificate specifying the disease, he is confined to the house for a period of not less than seven days and is totally disabled and prevented from attending to any part of his business. The insured does not actually receive payment till the total liability of the insurers has been ascertained. The period during which compensation may be payable varies between 26 and 104 weeks, though most insurers limit their liability to 52 weeks. Temporary partial disablement benefits are provided whilst the insured is convalescent, but the weekly payments are reduced to one-quarter of those payable for total incapacity by illness and the period is usually limited to four weeks. Such policies are terminated when the insured reaches the age of 60 and no payment is made for any illness contracted within four weeks after the commencement of the insurance. The illness risk is limited to the country in which the policy is issued, subject to the consent of the insurers should the insured propose to travel. A few insurers issue non-cancellable accidents and illnesses policies. Such insurances are uncommon, but provided that the renewal premiums are paid the policy continues till the age of 55, when the insurance terminates. Premiums are calculated on an actuarial basis.

General Policy Conditions.—Apart from those conditions which it has been necessary to discuss in passing, policies provide that, apart from the death benefit, no assignment of the policy shall be valid. In the event of an accident the insured must, within 21 days of its occurrence, notify the insurers and send them full particulars, accompanied by satisfactory medical evidence. The insured must, if required by the insurers, submit to a medical examination by the insurers' doctor and in the event of death the insurers are entitled to order a post-mortem examination at their own expense. If the insured changes his occupation he must notify the insurers and he must also advise them should he suffer any disease, physical defect or infirmity, thus giving the insurers an opportunity of reconsidering the risk. A cancellation clause is provided and the insurers may, by giving seven days' written notice to the insured, terminate their liability without prejudice to any claim which may arise prior to the termination of such notice. All differences arising out of the contract must be referred to arbitration.

Sickness Indemnities.—The benefits under such policies are similar to those provided by the accidents-only policy and in addition a weekly indemnity is provided for periods of continuous disability not exceeding 52 consecutive weeks. If as the result of a disease or illness the insured loses the use of two limbs or the sight of both eyes the insurers will pay him, in lieu of any other indemnity, excepting surgical or hospital fees, the weekly indemnity specified in the policy during the period in which the insured is disabled up to a maximum of a 100 weeks. No payment is made for any disease for which the insured is not treated by a physician nor for any disease in respect of which disability commences whilst the policy is not in force.

Coupon Insurance.—In recent times there has been a considerable growth in this class of business, which is generally undertaken by insurance companies on behalf of the periodicals concerned. The benefits, unlike those of the ordinary personal accident policies issued by insurance companies, apply only to more uncommon accidents and the weekly payments are generally very limited. Their most striking feature is the enormous capital sums which are offered as an inducement to buy the newspaper or magazine concerned and, whilst such insurances may be regarded favourably by the readers of certain journals, they should not be led to dispense with the more certain cover provided by the ordinary personal accident policies which are not subject to such irritating restrictions. (A. G. M. B.)

AMERICAN PRACTICE

With regard to accident and health insurance in the United States, American practice differs in various details from that of Great Britain, though the general principles are the same. In America the *proposer* is called the *applicant* and the *proposal* becomes the *application*, while the *capital sum* is styled *principal sum*. The word "indemnity" as used in American policies is

synonymous with "benefit," the amounts provided in the policies being classed as fixed or premeasured indemnity, regulated in amount by the ability or willingness of the insured to pay, and the policy becomes a valued benefit contract; there is no provision by which the amounts payable may be reduced in case of disability even though benefits payable under all insurance carried exceed the insured's earnings, but underwriters exercise great care against overinsurance in the original issue, requiring each applicant to certify that his earnings are in excess of benefits payable under all insurance carried and usually limiting the amount of insurance permitted to approximately three-fourths of the earnings.

There is never any right of subrogation in American policies by which the insured surrenders any claims against a third party who may be responsible for his injury. American policies do not carry a condition prohibiting the obtaining of additional insurance without consent of the company, but some contain a condition to the effect that if other insurance is obtained without notice to the company the amount of existing insurance is proportionately reduced. A great variety of accident policies, and also of accident and health policies, is issued in America, with many variations in amounts payable and in the sundry features. With a fixed principal sum payable for accidental death and a fixed weekly benefit payable for disability, there may be variations in the percentage of principal sum payable for loss of eyesight, or for loss of one or more limbs, or even for the degree of loss of a particular limb. Likewise, many variations occur in the period for which disability benefit is payable. It may be limited to a specified number of weeks, varying from a few to many, or the period for which benefit is payable may be limited only by the period of disability. Under the most common practice no period limit is fixed in case of disability from accident, while a limit of fifty-two weeks in case of disability from sickness is most favoured.

Partial disability is usually provided for at the rate of 50% of the total disability rate in respect to disability caused by accidental injury, but is not generally provided for in case of sickness disability, though in some instances a certain provision may be made for partial disability, or disability not requiring confinement to the house may be classified as partial and a smaller benefit provided. The usual American accident policy provides specific sums for loss of life, limb or sight and a stated weekly benefit for disability, while the usual health policy, commonly combined with the accident policy into a single document, provides a stated weekly benefit for disability due to sickness with occasional additional payments in case of complete blindness or complete paralysis. Most accident policies contain a provision doubling the benefits payable in case of accidents occurring in public passenger conveyances, elevators or burning buildings, and some include in this class other hazards more or less incident to the risk of travel.

Other provisions common in American policies include additional payments against surgical operations, hospital treatment, nursing and payment of doctors' bills in the case of non-disabling injuries. Some include an optional clause under which in case of certain specified injuries, such as fractures and dislocations, the insured may elect to take a lump sum in lieu of the disability benefit. There is no real uniformity as respects the inclusion of these subordinate features. Some accident policies are of more restricted scope and may exclude from their coverage a certain class of accidents, specified in greater or less number, in which case proportionately less premium is charged. There is also a great variety of special or "limited" policies designed to insure only against a certain class or a small number of classes of accidents. These are often referred to as "coupon" insurance because generally sold by special advertising or offered as an inducement to purchase of goods, subscription to a newspaper or other periodical. Generally they apply to accidents of least common occurrence and because of that fact a merely nominal price is charged, and are issued upon receipt of coupons attached to the advertisement.

The insuring clause most commonly in use in America differs somewhat in wording from that in use in Great Britain. Usually

it defines the insurance to be "against bodily injuries caused directly and independently of all other causes by accidental means," or by violent and accidental means, or by external, violent and accidental means, and there are other variations of verbiage without significant change of substance, the purpose always being to insure against the physical results of injury to the body caused wholly by accident, as distinguished from the natural processes following either wholly or partly from disease, degeneration or disintegration, which latter in case of disability becomes the function of health insurance and in case of death becomes the function of life insurance.

Health Insurance.—The most favoured form of health insurance in America insures against all sicknesses from whatever cause, and in such policies there are numerous variations. They may provide for all disability from the first day thereof to a specified period or without limitation. They may exclude from benefit the initial period of any disability and cover only disability after one week, or after a number of weeks or a number of months, with premiums varying in proportion. They may restrict payment of benefit to the period of confinement to house or may be without this restriction. They may exclude sickness contracted within a certain short period after the date of the policy or may cover any sickness contracted after the policy date. Additional payments may cover surgical operations, hospital treatment and nursing charges, or any or all of these may be omitted. Usually health policies stipulate that the insured must be under the treatment of a physician during any period for which disability may be claimed in order that there may be competent certification and that the necessary disability may be delimited as far as possible by proper care and treatment. So-called "limited" health policies are also issued to some extent, which confine their coverage to disability from certain diseases specifically named. Untold variations in this respect may be devised with proportionate variations in premium.

Statutory Provisions.—Those provisions of accident and health policies that relate to the performance and operation of the contract after issue are generally regulated by law. Many states have enacted statutes prescribing certain "standard provisions" which must be included in all such policies and prohibiting the inclusion of any contradictory or inconsistent conditions. Even in the states where such statutes have not been enacted it is the common practice of the companies to issue the same policies uniformly in all of them. These provisions govern such matters as the pro-rata reduction of the insurance in case of a change of occupation to one more hazardous, alterations or assignments of policies, reinstatement after lapse, the timely giving of notice and filing of proof of claim, examination by the company's physician in connection with claims, time for payment after proof, right of cancellation by insured in case of change of occupation to one less hazardous, rights of beneficiary, time when legal proceedings may be instituted. Certain other provisions may be included or omitted at the option of the issuing company. These permit reservation by the company of a right to cancel or to refuse to renew the policy, reduction of the amount of insurance in case additional insurance is obtained without notice, deduction from any benefit payable of premium then due and unpaid, limitation of the amount of insurance one person may have under various policies in the same company, limitation of the coverage within certain minimum and maximum age limits.

American policies do not require notice by the insured of a change of occupation, but the effect of such change, if any, is regulated by the statutory provisions. No notice is required from the insured of any change in his state of health except when it is to be made the basis of a claim for benefit. No arbitration clause is included in American policies, such a provision being commonly held illegal as tending to oust the courts of their jurisdiction.

Physical Condition of Applicant.—In the underwriting of both accident and health insurance the general physical condition of the applicant is given much weight, the application requiring disclosure of his present physical condition and past health record, which may influence the action of the underwriter even in the

issue of accident insurance where the state of health suggests susceptibility to more serious results in case of accident than would be common with a normal person, while both physical condition and health record are even more carefully considered when the application is for health insurance because of the possibly greater susceptibility to disease or sickness.

Premium Rates.—The premium rates for accident insurance are governed wholly by occupation, a basic rate first being fixed to cover the general hazards of life outside of the occupation and this rate being increased in proportion to additional hazards involved by the occupational exposure. For this purpose all known occupations are classified by the companies and they are brought into groups of relatively equal risk, resulting in some eight or more different rate classes as indicated by developed experience. Rates for health insurance do not commonly vary according to occupation, though benefit provisions often vary for the purpose of adjusting the cost in such occupations as involve particular exposure to occupational disease.

Canadian Practice.—In the Dominion of Canada general practices and forms of policies are very similar to those of the United States and statutory standard provisions also are required, these being similar to those in use in the United States.

ACCIDENTS, INDUSTRIAL: see INDUSTRIAL ACCIDENTS.

ACCIIUS or **ATTIUS, LUCIUS**, Roman tragic poet, the son of a freedman, was born at Pisaurum in Umbria, in 170 B.C. He must have lived to a great age, since Cicero (*Brutus*, 28) speaks of having conversed with him. His plays, which are praised by ancient writers (Horace, *Epistles*, ii. 1, 56; Cicero, *Pro Plancio*, 24), were mostly free translations from the Greek, but a few (including *Brutus* and *Decius*) were on Roman subjects. About 700 lines are extant and are given in Ribbeck (*Tragic Lat. Relig.*).

Accius wrote other works of a literary character: *Didascalicon* and *Pragmaticon libri*, treatises in verse on the history of Greek and Roman poetry, and dramatic art in particular; *Parerga* and *Praxidica* (perhaps identical) on agriculture; and an *Annales*. He also introduced innovations in orthography and grammar.

See Boissier, *Le Poète Accius* (1856); L. Müller, *De Accii fabulis Disputatio* (1890); Ribbeck, *Geschichte der römischen Dichtung* (1892); editions of the tragic fragments by Ribbeck (1897), of the others by Bährens (1886); Plessis, *Poésie latine* (1909).

ACCLAMATION, in deliberative or electoral assemblies, a spontaneous shout of approval or praise (Lat. *acclamatio*), the adoption of a resolution or the passing of a vote of confidence or choice unanimously, in distinction from a ballot or division. In the Roman senate votes were passed by acclamation in such forms as *Omnes, omnes, Aequum est, Iustum est*, etc.; and the praises of the emperor were celebrated in prearranged sentences by the whole body of senators.

In ecclesiastical councils vote by acclamation is common, the question being put in the form, *placet* or *non placet*. The Sacred College has elected popes by acclamation, when the cardinals simultaneously "acclaimed" one of their number as pontiff. In modern parliamentary usage a motion is carried by acclamation when approval is expressed by shouting such words as *Aye* or *Agreed*.

ACCLIMATIZATION, in the broad sense, is a term applied to the fact that plants or animals may be introduced, artificially or naturally, into a country with a climate different from that of their original habitat, and may successfully propagate there. What would come to the same thing is the successful persistence and propagation of plants and animals in a country whose climate has undergone some notable change, such as would be involved in the setting in of an ice age or a period of aridity. In this broad usage the term acclimatization is practically synonymous with naturalization.

But in its narrow usage acclimatization means a process by which organisms are changed in the course of generations in adaptation to new climatic conditions in the same or in another

country. This usage implies the theoretical postulate of racial adaptation to withstand climatic influences which were at first more or less unfavourable. The establishment of the adaptation might be interpreted by some along Lamarckian and by others along Darwinian lines, and this raises additional theoretical questions.

Thus some investigators, e.g., G. M. Thomson, who find little evidence of acclimatization in the strict sense, prefer to keep the term naturalization, which expresses an indisputable fact that organisms may thrive well when taken to another and in some respects different country. Willis defines acclimatization as "the accustoming of plants to new conditions and climates till they are not only capable of growing there but also of reproducing themselves freely." Thus, though the cherry and apple will grow well in the hills of Ceylon they are not acclimatized, for they do not produce fertile seed.

Effects of Naturalization.—When plants and animals get a footing in a new and different country, what changes may be looked for? (1) There is often a marked increase in the number of individuals in a given area, as is illustrated by the multiplication of the rabbits in Australia, or of greenfinches and skylarks in New Zealand. The reason is twofold: favourable conditions, such as abundant food, may increase the rate of multiplication, and there may be an absence of the enemies and other checks which kept the numbers down in the old country. There have been some costly verifications of the numerical increase that is apt to follow naturalization, as in the familiar case of rabbits in Australia and New Zealand.

(2) Another consequence that has been repeatedly noted is increase in individual size and perhaps vigour. The new conditions prove unusually stimulating. Speaking of plants introduced into New Zealand, G. M. Thomson writes: "Water-cress—a plant of two to four feet in length in European waters—grew in some streams to a length of from 12 to 14ft., and with stems as thick as one's wrist." This riotous exuberance is due positively to the stimulating conditions of the new territory, and negatively to the absence of the previous checks.

The popular interpretation of the rapid spread of introduced plants, e.g., "weeds," in new countries, is that they come from places where the struggle for existence is keener and where they have therefore become particularly efficient. According to Willis, "the real explanation, in all but a very few doubtful cases, is that their spread is due to change of conditions. This has usually been effected by man, who has often altered, or even destroyed, the conditions under which many societies of plants formerly flourished, thus giving a fair field to those newcomers that were suited to the new circumstances."

(3) Many naturalists have concluded that the lessening of the stringency of natural selection after transport to a new country allows an increase in the number of varieties, and the survival of peculiar forms, which would be speedily eliminated in the original environment. Thus, if there are few enemies, one might expect more numerous conspicuous variants, such as albinos. Here the careful work of G. M. Thomson is of great value. In 1891, he concluded that conspicuous colour-variations were on the increase among the rabbits introduced into New Zealand, and also among introduced birds like sparrows, thrushes, blackbirds, skylarks and starlings. Thirty years later he definitely withdrew this conclusion, the fallacy being that he was at first so busy looking for anomalous characters that he met with many, and unconsciously exaggerated the ratio of their occurrence. But inquiry must be made in other fields to see whether there is nothing to be said for the old view.

(4) So many naturalizations have been effected in different parts of the world that one would expect to find it easy to collect instances of change of habit; but there seems to be a strong conservative tendency among animals introduced into new haunts. When domesticated animals are transported to a wilder country there is sometimes an interesting individual rehabilitation of a long lost ancestral trait. Thus cows taken from Scotland to wilder conditions in California have been known to hide their calves in the thicket when they went to graze in the open. Sometimes, however, something novel occurs. Thus, sheep in New

Zealand have shown in some places the novel habit of stripping off long pieces of bark from the *gaya* trees. On the whole it seems that change of habit in consequence of naturalization is infrequent and very gradual.

(5) Some types are quickly at home in a new country, but do not show external change. Horses, rabbits, rats, sparrows, and fowls are usually somewhat indifferent to change of climate, while a tough animal like the yak of the Tibetan mountains refuses to thrive below a certain altitude.

Individual adjustments may be of much importance though they do not meet the eye, as in the case of adaptation to high altitudes. When a man accustomed to life near sea-level settles in a place at a high altitude, there is likely to be, if he thrives, an increase in the haemoglobin content of the blood. This is due at first to a reduction in the volume of the plasma and a concentration of corpuscles, but secondarily to an increased corpuscle-formation. At very high altitudes there is some evidence of an increase in the affinity of haemoglobin for oxygen. Another change is demonstrable in the reaction of the blood to the acid side, and this is also useful since less carbon dioxide is required to stimulate the respiratory centre, thus increasing pulmonary ventilation. We have referred to this adaptation to high altitudes because it illustrates an adjustment that can be established only by intimate inquiry. It is highly probable that similar adjustments are exhibited by many animals when they have to face a marked climatic change.

Many facts confirm the suggestion that the success or failure of attempted naturalization may depend on inconspicuous constitutional peculiarities. Thus G. M. Thomson notes for New Zealand that the greenfinch and the chaffinch have thriven remarkably, while the allied linnet has failed. "The reasons for these failures are often so obscure that no plausible explanation has yet been given."

A hint of the frequent subtlety of conditions may be found in cases where the attempted naturalization of a plant fails, as of heather in Ceylon, because the associated root-fungus or mycorrhiza will not grow.

(6) When an organismal change directly induced by some change in environment, nutrition, or habit, takes such a grip that it persists after the inducing conditions have ceased to operate, it is called a modification, or less conveniently, an individually acquired character. There seem to be some climatic modifications, and the following may be mentioned: (a) An Englishman who works half his lifetime under a tropical sun may become so tanned that the deposit of melanin pigment in the skin does not disappear during all the years in which he enjoys his pension at home. Of course it must not be inferred that the blackness of the negro's skin was directly produced in this way by the tropical sun. (b) Nägeli brought some Alpine plants to the Botanical Garden at Munich, and there many of them became in the first year so much modified that they were hardly recognizable as the same species. Their descendants in the garden were also quite different from the Alpine originals. Thus the small hawkweeds (*Hieracium*) became large and thickly branching with abundant blossoms. The modifications were very striking, and in some cases many generations were observed—even for 13 years. The re-appearance was probably due to the fact that the original modifications were directly re-impressed on each successive crop, for when the plants were removed from the rich garden to poor, gravelly soil, the acquired characters gradually disappeared, and the plants exhibited once more the original Alpine characters. There was no convincing evidence of hereditary entailment.

It is important not to think of these matters too simply. Thus, as Goldschmidt points out, the normal development of particular characters, such as general growth and pigment formation, has been "harmonized" for a definite environment. But they have different temperature coefficients, and novel conditions may throw them out of harmony. Moreover, modifications resulting from climatic change must not be thought of as necessarily beneficial. Thus some Lepidoptera tend to melanism in the cold, and others at high temperatures, without there being any demonstrable advantage in either case.

(7) If evidence could be obtained of the hereditary entailment of climatic modifications, this would serve as a basis for a Lamarckian theory of acclimatization. It is necessary to inquire afresh whether there are any facts supporting the Lamarckian interpretation. Bordage records some observations on peach-trees (*Prunus persica*) grown from seed of European origin sown in Reunion. For ten years or so the trees shed their leaves as in Europe. Later on, after 20 years, a considerable degree of evergreenness was exhibited. There was no bare period. When seeds of these partial evergreens were sown in the lowlands they grew into trees verdant throughout the year, but the same was true of seeds sown in certain mountainous districts with a considerable degree of frost. They also grew up into young peach-trees which were also evergreen. But European seeds sown in similar situations developed into ordinary deciduous trees. This is a peculiar case and may be interpreted as follows: The original imports underwent a gradual constitutional change—some modification of their metabolism; this might affect the constitution of the seed during the period when it was still part and parcel of the parent's body. The change in the metabolism might result in the affected seeds developing into evergreens, though the direct environmental influence would work in the opposite direction. It is unfortunate that the observations were not carried further.

A famous case, often referred to, is that of the feral horses of the Falkland islands, which Darwin studied on his "Beagle" voyage (1833). He says that the horses and also the cattle were introduced by the French in 1764. Whereas the cattle are large, the horses are small, and Darwin speaks of them as "having degenerated." "They have lost so much strength that they are unfit to be used in taking wild cattle with the lazo: in consequence, it is necessary to go to the great expense of importing fresh horses from the Plata. At some future period the southern hemisphere probably will have its breed of Falkland ponies, as the northern has its Shetland breed." Darwin regarded the degeneration of the Falkland islands horse as due to the humid climate and the lack of suitable food, but it is difficult to believe that marked changes were effected between 1764 and 1833. It would be necessary to know more about the horses originally imported.

Various statements have been made in regard to changes brought about in the hair of sheep, goats, cattle, sheep-dogs, and even cats, when these animals are taken to a more rigorous climate. It is said that the fur becomes longer and thicker, which would be a useful adaptation. But there is a lack of precision in these statements, and a regrettable absence of measurements. It would be useful to know what additions were made to the coat after the climatic change; whether the offspring, exposed to the cold from birth, showed further additions; and the character of the fur in the grand-offspring. As regards modifications, no inference can be drawn from the occurrence of adaptive peculiarities, unless the history is known.

On the whole we are forced to the conclusion that the evidence of the heritability of climatic modifications is unsatisfactory.

Natural Acclimatization in the Past.—All the world over there are instances of related species flourishing under different climatic conditions, and few evolutionists have any hesitation in regarding these as the outcome of divergent evolution. It may be recalled that while Darwin did not think much of man's achievements in acclimatizing, he had no doubt as to Nature's powers in this direction.

Three saving-clauses should be kept in mind: (a) When two nearly related species are thriving in climatically different surroundings, it should not be taken for granted, as it usually is, that all their differences are now part and parcel of the inheritance. Some of the differences may be modificational, hammered on each successive generation in the course of development. There is need for more experimental study of species. (b) There has been a tendency to strain the interpretation of specific characters as adaptive to particular conditions of life, such as those implied in climate. Many characteristics separating related species in different localities may be reasonably interpreted as climatic adaptations, but each case should be carefully judged on its merits. (c) When a species is extending its range in consequence perhaps

of increasing numbers, the factor of isolation may come into operation, say in the form of a river or a watershed, and variations may be separated off which have no particular relation to the new territory or climate in which the leaders of the advance find themselves. Thus new species may arise by the physical segregation of diversely varying contingents of an advancing army, till the climatic difference itself may become an isolating factor.

Accepting, with these saving-clauses, the idea of natural acclimatization, we must now ask how it may have been effected. The Lamarckian answer involves the postulate of the transmissibility of modifications, especially of functional modifications; and the evidence of this, summed up by Kammerer (1924) and by MacBride (1924), appears inconclusive. The interpretation which seems to involve fewest assumptions is that of Darwin. In discussing acclimatization (1868), Darwin laid most emphasis on the natural selection of spontaneous variations. As to these variations he expressly says "there is no evidence that a change in the constitution of the offspring necessarily stands in any direct relation with the nature of the climate inhabited by the parents." In regard to selection he lays emphasis on two points: (a) the organism's power of resistance to difficult conditions in the new climate, and (b) some useful change in the period of reproduction, such as earlier flowering and fruiting.

To Darwin's interpretation an addition may be suggested. It is conceivable that the climatic peculiarities may affect the metabolism of the organism through and through, and may thus serve as stimuli to the variability of the germ-cells. If the climatic peculiarity should induce (a) an adaptive modification in the body of the organism and (b), at the same time, a variation in the germ-cells which finds expression as a similar new character in the offspring, the phenomenon is called "parallel induction." It must be distinguished theoretically from the transmission of a somatic modification; it is a change induced in the germ-cells along with, but not through, the bodily modification.

But it is possible that climatic peculiarities may penetrate into the germ-cells and affect them without producing any modification in the body. Thus W. L. Tower subjected full-grown potato-beetles (*Leptinotarsa*) to peculiar conditions of temperature and humidity during the time when the eggs were maturing, and found that "mutations" occurred in a certain proportion of the offspring. The parents were not affected, having passed the plastic stage; and some of the eggs were not affected at all. Moreover, the same environmental peculiarity, analogous to a climatic change, did not always evoke the same mutation. Some of the mutations in colour and markings were very striking; others affected minute details of structure. In subsequent generations there was no reversion. This case is of particular interest in connection with acclimatization, for the artificial environmental conditions, effected in large steel and glass cages, were comparable to different climatic conditions in which different species of potato-beetle live.

By Muller in particular it has been shown that an exposure of the germ-cells of the fruit-fly (*Drosophila melanogaster*) to appropriate doses of X-rays is followed by numerous mutations, which often breed true. This experimental irradiation illustrates the possible action of the environment as a variational stimulus. A mutation following a climatic change might have this origin. As Weismann said many years ago (1904): "It does not seem impossible that the climate may have a variational influence upon certain determinants of the germ-plasm, for we have already seen that the influence of cultivation may incite plants and animals to hereditary variations, and that slowly increasing disturbances in the equilibrium of the determinant system may thereby be produced, which may suddenly find marked expression as 'mutations.' But there is little probability that *adaptations*, that is, transformations corresponding to the altered climate, can arise in this way!" The meaning of this last sentence is that Weismann believed these adaptations were the outcome of the prolonged natural selection of fluctuating variations in the germ-plasm.

The Darwinian theory, as applied to natural acclimatization, may be briefly resumed in more technical terms. In any species in any given environment there will be an observable percentage

of variations from type in a given number of births, and these variations yield a curve of frequency or probable error. The steepness of the curve is a measure of the variability of the species. The aberrants on all sides are pruned off by selection. If the environment is changed, selection may no longer operate on the same axis as before, but may tend to prune off variations on one side of the mean more than on another. In the course of time, the apex of the curve, representing the type form, will shift to suit the new conditions, since more of the aberrants on the favoured side will live to reproduce.

Quite a separate question is this: that the new environment may increase the variability of the species, flattening the curve of probable error. The effect of this is that selection has more material to work with, and therefore attains its end more rapidly, although of the variations appearing as many will be unfavourable as favourable. A species in which there is little variation presents a greater inertia to the shifting effect of altered climatic conditions than a variable species. In the less variable species there will be relatively fewer favourable variations to mate with the type.

Bateson's Silliman Lectures contain a valuable criticism of the somewhat facetiously accepted views (a) that local and climatic varieties are adaptational, (b) that the influences of environment have directly led either to the production of these varieties or to their selective stabilization, and (c) that there is gradual transition—or mass transformation—from one species to another in response to climatic influences. Bateson lays much emphasis on the rôle of isolation and on the intrinsic character, e.g., Mendelian dominance of the sporadic variations that are of frequent occurrence.

Of importance in connection with acclimatization is Erwin Baur's study of cultivated snapdragons, especially *Antirrhinum majus*. He finds a frequent occurrence of small mutations, transmissible in Mendelian fashion, often showing themselves in "pure lines," and sometimes suggesting an enhancement of vigour, as when a mutant appears with deeper green in its leaves. According to Baur wild species of snapdragon, like garden races, have often arisen by the summation of small mutations.

Change of Climate.—So far we have considered what may happen when organisms are naturalized, perhaps acclimatized, in a new and different environment. But similar biological problems are raised when we think of the changes that occur or have occurred in the fauna and flora of a country after some drastic alteration of the climate—towards aridity or humidity, towards markedly higher or lower temperature. To what extent have changes of climate functioned as factors in organic evolution? (1) In extreme cases, as when a country is covered with glaciers, there may be an almost complete elimination of life, as happened over the greater part of Britain during the quaternary glacial periods. (2) In less severe conditions the gradual setting in of unfavourable climatic conditions would exert a selective influence. Thus xerophytic plants with reduced transpiration would tend to survive when arid conditions encroached; quickly flowering and fruiting plants, entrenched below ground in winter, with reserves in rhizome and bulb, would tend to survive when the snow began to cover the ground for many months of the year. In a country becoming warmer there might be survival value in aestivation; in a country becoming colder the advantage might be with the hibernators. In scores of ways a gradual change of climate would sift the fauna and flora.

(3) Some animals able to move about for considerable distances and not too slowly would be prompted by climatic changes to shift their quarters. As the severity of the ice ages spread southwards in Europe, many northern mammals came with it, thus remains of reindeer, lemming, and arctic fox are found in deposits far to the south. As milder climates set in and the glaciers melted, the descendants of some of the arctic types, like reindeer and white fox, were able to trek for the north. Some, however, remained as refugees on the mountains, like the snow vole (*Microtus nivalis*) of the high Alps. Some of the true bird migrations may owe their origin in part to distant climatic changes such as those of the quaternary ice ages (see MIGRATION).

(4) It is reasonable to suppose, though difficult to prove, that change of climate in a country induced important changes of

habit. Thus Barrell and Lull have suggested that continental elevation and consequent aridity, especially in the Himalayan region, led in the Miocene or early Pliocene ages to a dwindling of the forested area where man's ancestors were at home. The alternatives were to find other forests in warmer countries, as the present-day anthropoid apes did, or to be eliminated, or to come to earth, and begin afresh on a new line of life. The last solution may have been of critical moment in the evolution of Hominoids.

(5) Climatic changes in a country may also have played an important part in punctuating the life-history. A kind of variation which has not received adequate attention may be called "temporal." It includes alterations in the tempo, or rate, or rhythm of metabolic processes, or in the duration of particular phases in the life-history. In vertebrate animals, at least, this might be brought about by variations (also, of course, requiring to be accounted for somehow) in the secretory activity of the ductless or endocrinal glands, the hormones of which serve now as accelerators and again as brakes. The life-histories of many types differ from one another in the shortening or lengthening of particular arcs on the life-curve or trajectory. Here is a kind of evolution to which climatic variations may have applied a frequent spur. Thus when the rate of development was such that the life-cycle could not be completed in the first summer, there would be a tendency to favour variations in the direction of interpolating a larval phase, as in insects, suited for an accumulation of reserves, a reduced intensity of life in cold weather, a diminished exposure of vulnerable surface, and so on. Opinions may differ in regard to particular cases, but it is a legitimate and instructive inquiry to associate temporal variations in the life-curve with seasonal and with climatic periodicities.

The Arctic tundra is marked by a long dark winter of bitter cold and a short nightless summer of intense illumination, therefore it is reasonable to postulate a prolonged process of elimination as the climate changed—an elimination of those types which did not vary in the direction of quick-flowering and quick-fruited, dying down in winter, dispensing with all but a little water, and accumulating stores in underground parts.

Among the features of the life-curve that may be tentatively associated with climatic changes, the following may be suggested—the length of the mammalian gestation and the season for giving birth; the periodicities of migrating birds; the interpolation of periods of winter sleep, rest, coma, lethargy and even differentiation. Every trajectory of life should be looked at in the light of the evolution of climates.

Often in the history of the earth a change towards great cold has involved severe elimination. In humid periods there tends to be abundant succulent fodder for browsing animals and extensive forests affording shelter. Diminution of moisture, if it does not go too far, favours the increase of grasses and of grazing animals. Aridity makes the forests shrink and prompts the search for new haunts. The times of quickening, the "expression-points" or "pulsations" of evolution, may often be correlated with climatic changes, chiefly in temperature and humidity, due sometimes to topographic, at others to general atmospheric, conditions. Behind these, again, lie larger factors still, such as shrinkages of the earth's crust.

Interaction of Endemic and Introduced Faunas.—(1) The newcomers may destroy the indigenous or previously naturalized forms. Thus the mongoose, introduced into Jamaica, destroyed the indigenous "cane-rats" and the alien ship-rats. The introduced animals may become so numerous that they make life difficult for their predecessors though they do not actually devour them. They may, for instance, seriously reduce the food-supply, but they may be prejudicial with varying degrees of directness. When the brown rat (*Rattus norvegicus*) found its way to Britain in the early 18th century, it proved itself harder, more plastic, and more fecund than the black rat (*Rattus rattus*), with the result that in 50 years the latter was almost exterminated except in places where it was continually being re-introduced by ships.

Sometimes the influence is more subtle. Thus an extension of squirrels into an area may be followed by the reduction of the

number of wood-pigeons. There does not seem at first sight any intersection of the two lives; but squirrels, though largely vegetarian, cannot resist killing and eating the young squabs in the nest; and this is, from the farmer's point of view, a useful check.

The introduction of an animal into a new country may involve the introduction of its parasites; thus rats harbour rat-fleas which disseminate bubonic plague, and it is from rats that pigs, and thence men, become infected with the disease of trichinosis, which is due to *Trichinella spiralis*, a small Nematode. Many of these inter-relations are very subtle; thus the problem of getting rid of Bilharziasis in Durban is easier than it is in Japan, for in South Africa the only host of the adult parasite is man, whereas in Japan it also occurs in cattle. In both countries the juvenile stages are spent in various water-snails, and their abundance or rarity in turn is correlated with the presence of water-birds which feed upon them and of water-plants on which they feed.

The Case of New Zealand.—The peculiar value of New Zealand in reference to the problems of naturalization is that the introduction of the majority of the non-indigenous larger animals is more or less definitely known; see G. M. Thomson's masterly study: *The Naturalization of Animals and Plants in New Zealand* (Cambridge, 1922).

Apart from two species of bats, it is doubtful if there are any indigenous mammals in New Zealand; but 48 species have been introduced, 44 purposely and four accidentally. The four comprise the mouse and three rats, one of which, the Maori rat (*Mus exulans*), has disappeared since European settlement began. Twenty-five of the 48 species of mammals are at present well-established and feral in certain districts—wallaby, common opossum, sooty opossum, pig, horse, various deer, cattle, sheep, goats, chamois, cat, ferret, stoat, weasel, black rat, brown rat, mouse, rabbit, hare and hedgehog.

About 130 species of birds have been purposely introduced into New Zealand since the date of Captain Cook's landing, and 24 have become truly wild, such as mallard, pheasant, pigeon, skylark, thrush, blackbird, hedge sparrow, rook, starling, Indian mynah, house sparrow, chaffinch, goldfinch, greenfinch and yellow-hammer.

On the other hand, since 1868, nine species of birds have become either very rare or extinct, such as native crows, huia, native thrushes, the burrowing parrot *Stringops*, the native quail, and the white heron. Others, once abundant, have been driven back into areas where there has not been much settlement. As to the causes, Thomson writes: "It must not be supposed that it is the introduced animals alone which have produced this effect, even though rats, cats, rabbits, pigs, cattle, stoats and weasels, as well perhaps as some kinds of introduced birds, have penetrated beyond the settled districts. It is largely the direct disturbance of their haunts and breeding-places, and the interference with their food supply, which has caused this destruction and diminution of the native fauna."

What is true for birds holds also for lower animals, from lizards to insects; but again the reasons are to be found in human intervention rather than in direct competition with newcomers. This is corroborated by the fact that there have been some notable cases of increase during the last 50 years. Thus the bell-bird has become abundant in the South island, though scarce in the North; and the harrier has greatly increased, perhaps in relation to the abundance of young rabbits. The wax-eye or blight bird (*Zosterops coerules*) has apparently increased greatly since first recorded in 1832, perhaps in relation to the supply of animal food about houses and stockyards. The case of the long-tailed cuckoo (*Urodynamis taitensis*) is interesting as an illustration of the complexity of inter-relations. It seems to have become increasingly numerous during the past 30 years, and this is attributed to the increase of small European birds, whose eggs and young it eats, and also to the food afforded in and about trout-hatcheries.

The Case of Scotland.—Analogous to G. M. Thomson's study of New Zealand is Dr. James Ritchie's *Influence of Man on Animal Life in Scotland* (1920). Both are books of distinction. In ancient times—long before the ice ages and long before man reached Scotland—the British area was simply an outlying part of

the European continent, and must have shared its fauna. But of this original European fauna there are almost no British remains. There set in a succession of ice ages, interrupted by milder interglacial periods. Vast ice-sheets, sometimes 3,000 feet thick, covered the whole of Scotland and most of England, except an area along what is now the south coast. Almost all the old animal tenants of Scotland were eliminated. When the ice-sheets melted, there was a re-peopling of Britain from the Continent, for there were grassy lowlands stretching across parts of the present North Sea. The re-peopling brought back many mammals, lower animals and flowering plants. Some subsequent surface-movement led to complete insulation, shutting the door to further colonization as far as the larger land animals are concerned. Small creatures are, of course, readily introduced on the feet of birds.

Except for some indications, not yet fully worked out, in Inchadamph caves in Sutherlandshire, there is no evidence of Palaeolithic man in Scotland, though he lived in Britain farther south; the first-comers to Scotland, perhaps 8,000 years ago, were Neolithic. What higher animals greeted Neolithic man when he arrived in Scotland? The answer is: the present mammalian fauna, minus some that have been introduced later, such as rabbits, rats, and domestic mammals, and plus some that have been lost, such as reindeer, bear, and wolf. As regards their origin, the original Scottish mammals, present when man established himself, might be grouped in three contingents: (a) those distinctively arctic, like the reindeer and the lemming; (b) those of the forests, like the red deer and the elk; and (c) those of the plains like the hare and the wild horse.

Reindeer, probably of the woodland or caribou variety, persisted as wild animals in the north of Scotland until the 12th century. Beside the reindeer may be included the giant fallow deer (Irish elk) and the true elk, the former extinct, the latter no longer represented in Britain. The red deer and the roe deer are persistent representatives of the old fauna; the fallow deer is a subsequent introduction.

Appearing first in inter-glacial deposits, but lasting for many centuries along with man, was the wild ox or urus (*Bos primigenius*), once widespread in Europe. Man did not domesticate it in Scotland, but it may have crossed with the Celtic shorthorn (*Bos taurus longifrons*) which he brought with him when he came. The wild boar (*Sus scrofa*), on the other hand, was one of the early Scottish mammals, doubtless spreading from the forests of central Europe, and it was domesticated in Scotland as elsewhere. There were wild horses in Scotland before man arrived—the Celtic pony type (*Equus agilis*), common long ago in western Europe; and traces of these linger in the Hebridean pony and the Shetland pony. But the main stock of domesticated horses probably came in the train of the Neolithic herdsmen from the continent, notably perhaps from Scandinavia.

As to the larger carnivores, the wolf lingered in Scotland till the 17th century, even to 1743, according to some. Its disappearance was especially connected with the shrinkage of the forests, and with more determined wolf-hunting, which was compulsory as late as the 15th century. The brown bear lingered in Scotland into the Christian era, and with it the lynx.

Of the original small carnivores there is a persistence of fox, badger, otter, polecat, stoat, weasel, wild cat and marten. The last is dwindling to the vanishing point; the wild cat is rare, but of recent years notably on the increase. Seals continue to hold their own, but the walrus, which used often to visit Scottish coasts, has been persecuted into extreme rarity. Most cetaceans, except porpoises, become scarcer every year.

Among rodents, the beaver and the lemming have disappeared; the common hare and the mountain hare have increased, partly through preservation and partly because of greater abundance of food afforded by the spread of agriculture. The rabbit is an instance of naturalization, for it was unknown in Britain before the Norman conquest. Both the black rat and the brown rat are aliens, the former dating from the time of the Crusaders and the second from about the middle of the 18th century. The small native rodents, the voles and mice, hold their own, and so do the insectivores—the hedgehog, the mole and the shrews.

Taking a general survey, we see that there has been in Scotland an introduction of domesticated sheep, cattle, horses, fallow deer, dog, cat, poultry, pheasants and a few more. The wild rabbits were probably introduced deliberately, the rats unwittingly. Since man settled in Scotland the fauna has lost about 14 species of mammals and birds, and while Ritchie points out that the total number of species is actually greater, the standard is lower. The noble has been exchanged for the ignoble—the elk for the earthworm; the visible has been exchanged for the invisible—the beaver for the bug!

The case of Scotland is instructive since the area is small and the fauna well-known, and Dr. Ritchie's careful study shows the complexity of the factors that are often involved in faunistic change. Besides the alterations in climate, there are those involved in deforestation, drainage, the extension of arable land, and the reduction of wild corners. Much has depended on man's attitude to the wild life of the country, for he sometimes preserves and sometimes exterminates. The introduction of new types has, no doubt, its influence on those in possession, but this is often far from being a case of sheer competition.

Where man plays a large part two main processes may be recognized. On the one hand, there is a diminution in the number of larger, more highly evolved types, partly because they are apt to be dangerous to human life or destructive of stock and crops, partly because of fashion and a pride in trophies, but partly as the result of slow processes such as deforestation and the spread of agriculture. On the other hand, "while man lops off giants at the head of the scale he adds insignificant pigmies at the bottom," partly by carelessness, as in the case of rats and cockroaches, partly by thoughtlessness, as in the case of rabbits in Australia or sparrows in the United States.

Method of Naturalization.—What should man do when he wishes to naturalize a valuable plant or animal in a new and markedly different country? If trial has shown that naturalization is not easy, the transporter should work with those varieties which seem most likely to be suitable. Attention should also be paid to the quality of variability, for some stocks are much more fixed than others. It may be useful to transport individuals of the most promising stocks to some intermediate station, where selection may be made among the variations that continue to arise. Darwin noted that "Merino sheep bred at the Cape of Good Hope have been found far better adapted for India than those imported from England." (*Variation*, 1868, p. 305.) In cases where success in the new country seems to depend on the possession of a particular character, such as thick fur or woolly leaves, the variants selected would be those tending most markedly in that direction, but Mendelian methods might enable the breeder to "graft" on to the tentative imports the desirable character in question if it existed elsewhere in an allied race. By more systematic selection of heritable variations and by Mendelian hybridizing, it seems likely that the process of acclimatization might be greatly extended and hastened.

Willis notes that man has often failed in naturalization by attempting too much abruptly. Learning from failure, he is now trying gradual transitions, "as in the way he has treated Liberian coffee in Java, taking the seed of successive generations a few score yards higher up each time, till he has persuaded the tree to do well at a much higher elevation than that to which it is naturally suited." The attempts to acclimatize the beautiful *Cyperus papyrus* in the Ceylon Botanic Garden failed when seed from Europe was used, but seed from Saharanpur in India succeeded at once. The moral is that man must moderate his impatience and take a hint at least from Nature's operations by small steps throughout long periods.

ACCOLADE, a ceremony used in conferring knighthood; but whether it was an embrace (according to the use of the modern French word *accolade*), or a slight blow on neck or cheek, is not agreed. Gregory of Tours writes that the early kings of France kissed the knights on the left cheek; and William the Conqueror is said to have made use of the blow in conferring knighthood on his son Henry. At first it was given with the fist, but for this was substituted a gentle stroke with the flat of the sword on the side of the neck, or on either shoulder. In Great Britain the sovereign still employs this latter form. "Accolade" is also a technical term in music-printing for a sort of brace joining separate staves; and in architecture it denotes a form of decoration on doors and windows.

ACCOLTI, BENEDETTO (1415-1466), Italian jurist and historian, was born at Arezzo, in Tuscany. He was for some time professor of jurisprudence in the University of Florence, and in 1459 became chancellor of the Florentine Republic. In conjunction with his brother Leonardo he wrote in Latin a history of the first crusade, entitled *De Bello a Christianis contra Barbaros gesto pro Christi Sepulchro et Judaea recuperandis libri tres* (Venice, 1432; Italian trans., 1543; French trans., 1620), which, though itself of little interest, is said to have furnished Tasso with the historic basis for his *Jerusalem Delivered*. His brother FRANCESCO (1418-1483) was also a distinguished jurist.

ACCOLTI, BERNARDO (1465-1536), Italian poet, born at Arezzo, was the son of Benedetto Accolti. Known in his own day as *l'Unico Aretino*, he acquired great fame as a reciter of impromptu verse. He was listened to by large crowds, composed of the most learned men and the most distinguished prelates of the age. His works, under the title *Virginia, Comedia Capitoli e Strambotti di Messer Bernardo Accolti Aretino*, were published at Florence in 1513 and have been several times reprinted.

His brother, PIETRO ACCOLTI (1455-1532), was made cardinal by Julius II. He was abbreviator under Leo X., and drew up in 1520 the bull against Luther. In 1524 he became archbishop of Ravenna. Pietro's nephew, BENEDETTO (1497-1549), was also a cardinal, under Clement VII., and a writer of Latin verse.

ACCOMMODATION, in theology has two chief meanings. (1) It is used to describe the method of adapting the presentation of truth to the learners' capacity. In a sense all revelation of God must be "accommodated" to man: the naked revelation would be so dazzling as to blind him. When Jesus withheld certain truths from the disciples because they could not yet bear them (John xvi. 12) he was practising accommodation. Teaching by symbol or parable, too, is accommodation. (2) When words used with a definite reference to one subject are applied to another subject we have accommodation in a more special sense. Thus Matthew ii. 15 states that Jesus was taken to Egypt that the word of the prophet, "Out of Egypt did I call my son," might be fulfilled: but the prophecy quoted, Hosea xi. 1, quite clearly means Israel by "my son."

In biology accommodation is used to describe adjustments achieved by an individual organism over and above those which it makes as part of its inheritance. In psychology it means "the process by which habit is modified, cancelled and added to" (J. M. Baldwin). For accommodation in optics see OPTICS.

ACCOMMODATION BILL. An accommodation bill, as its name implies, is a bill of exchange (*q.v.*) accepted and sometimes endorsed without any receipt of value in order to afford temporary pecuniary aid to the person accommodated.

ACCOMPANIMENT, a musical term for that part of a vocal or instrumental composition added to support and heighten the principal vocal or instrumental part; either by means of other vocal parts, single instruments or the orchestra. Owing to the early custom of only writing the accompaniment in outline, by means of a "figured bass," to be filled in by the performer, and to the changes in the number, quality and types of the instruments of the

orchestra, "additional" accompaniments have been written for the works of some of the older masters; such as Mozart's "additional" accompaniments to Handel's *Messiah* (see article on HANDEL). In the case of songs an accompaniment may consist merely of a few chords of the simplest kind or take the most elaborate form and constitute the most striking feature of the composition. In the latter case the performance of such accompaniments calls for the highest skill and constitutes a distinctive branch of the pianist's art, demanding the amplest powers of execution and first-class musicianship, especially when the player is called upon, as sometimes happens, to transpose a difficult accompaniment at sight for the convenience of the singer. Accompanying is also an important branch of conducting, in the case of concertos, choral music, and so forth.

ACCOMPLICE, in law, one who is associated with another or others in the commission of a crime, whether as principal, abettor, or accessory (*q.v.*). Although the uncorroborated evidence of an accomplice is admissible in law, and may be acted upon by a jury, it is the duty of the judge to warn the jury that it is always dangerous to convict on such evidence, and he should advise them not to convict (*R. v. Baskerville*, 25 Cox. C.C. 524).

ACCORAMBONI, VITTORIA (1557-1585), an Italian lady famous for her great beauty and accomplishments and for her tragic history. She was born in Rome of a family belonging to the minor noblesse of Gubbio, which migrated to Rome. After refusing several offers of marriage for Vittoria, her father betrothed her to Francesco Peretti (1573), a nephew of Cardinal Montalto, who was regarded as likely to become pope. Vittoria was admired by the most brilliant men in Rome, and being luxurious and extravagant she and her husband were soon plunged in debt. Among her admirers was P. G. Orsini, duke of Bracciano, and her brother Marcello, wishing to see her the duke's wife, had Peretti murdered (1581). The duke himself was suspected of complicity as he was believed to have murdered his first wife Isabella de' Medici. They were married shortly after. But attempts were made to annul the marriage; Vittoria was imprisoned, and only liberated through the interference of Cardinal Carlo Borromeo. On the death of Gregory XIII., Cardinal Montalto, her first husband's uncle, was elected in his place as Sixtus V. (1585); he vowed vengeance on the duke of Bracciano and on Vittoria, who, warned in time, fled first to Venice and thence to Salò in Venetian territory. Here the duke died in Nov. 1585, bequeathing all his personal property to his widow. Vittoria, overwhelmed with grief, went to live in retirement at Padua, where she was followed by Lodovico Orsini, a relation of her late husband and a servant of the Venetian republic, to arrange amicably for the division of the property. But Lodovico hired a band of bravos and had Vittoria assassinated (Dec. 22, 1585). He himself and nearly all his accomplices were afterwards put to death by order of the republic.

About Vittoria Accoramboni much has been written and she has been greatly maligned by some biographers. Her story formed the basis of Webster's tragedy, *The White Devil* (1612), and of Ludwig Tieck's novel *Vittoria Accoramboni* (1840); it is told in D. Gholi's vol. *Vittoria Accoramboni* (Florence, 1870), and an excellent sketch of her life is given in Countess E. Martinengo-Cesaresco's *Lombard Studies* (London 1902).

ACCORD, in law, an agreement between two parties, one of whom has a right of action against the other, to give and accept in substitution for such right any good legal consideration. Such an agreement when executed discharges the cause of action and is called *Accord and Satisfaction*. This specific form of pleading is obsolete in England.

ACCORDION, a small portable reed wind instrument with keyboard, one of the smallest members of the organ family, invented in 1829 by Damian, in Vienna. It consists of a bellows of many folds, to which is attached a keyboard with from five to 50 keys. The keys on being depressed, while the bellows are being worked, open valves admitting the wind to free reeds, the pitch of the note being determined by the length and thickness of the reeds. The right hand plays the melody on the keyboard, while the left works the bellows and manipulates the two or three bass harmony keys, which sound the simple chords of the tonic and

dominant. The archetype of the accordion is the cheng (*q.v.*) or Chinese organ, between which and the harmonium it forms a connecting link structurally. Improvements in the construction of the accordion produced the concertina (*q.v.*), melodion and melophone.

ACCORSO (ACCURSIUS), MARIANGELO (c. 1490–1544), Italian critic, was born at Aquila in the kingdom of Naples.

He was a great favourite with Charles V., at whose court he resided for 33 years, and by whom he was employed on various foreign missions. He was the first editor of the *Letters of Cassiodorus*, with his *Treatise on the Soul* (1538); and his edition of *Ammianus Marcellinus* (1533) contains five books more than any former one. The affected use of antiquated terms, introduced by some of the Latin writers of that age, is humorously ridiculed by him, in a dialogue in which an Oscan, a Volscian and a Roman are introduced as interlocutors (1531).

ACCOUNT, a term of very various use in book-keeping, banking and stock exchange terminology (*see* BANKING AND CREDIT) indicating counting, reckoning, especially of moneys paid and received, hence a statement made as to the receipt and payment of moneys. The following are some of its chief usages:—

Balanced account, an account in which the total debits equal the total credits and which has been ruled off to indicate that fact.

Balancing account, an account contained in a subsidiary ledger which shows in aggregate and also in reverse, as to debit and credit, the total of the detail accounts. The use of such an account makes a ledger self-balancing. The information contained in a balancing account is essentially that found in a *controlling account* although the debits and credits appear in reversed order in the *balancing account*.

Closed account, same as balanced account (*q.v.*).

Contra account, an account of contrary tendency which must be considered with another account because of an interlocking relationship. For example, a customer of a business may also be a creditor. If the amount he owes as a customer is less than the amount that is due him as a creditor, the business may remit a check for the net amount. The term used in referring to the amount due from the customer in this case is *contra account*.

Controlling account, an account in the general ledger which reflects in aggregate the details of two or more accounts of the same tendency. Ordinarily the underlying accounts are operated in a subsidiary ledger.

Impersonal account, an account which is not a *personal account* (*q.v.*). Any expense or income account is an impersonal account.

Mixed account, an account containing two or more separate classes of transactions. The “merchandise account,” for example, contains a record of purchases, sales, purchase returns, purchase allowances, sales returns, sales allowances, freight and cartage, etc. In modern accounting, a separate account called a *simple account* is maintained for each class of transactions.

Nominal account, an account which reflects a change in the financial condition of a business. Thus, it is an account which finally finds its way into the profit and loss account; *e.g.*, sales, purchases, interest, discount, salaries, wages, commission and advertising expense. All of the accounts appearing in a statement of income, and profit and loss, are *nominal accounts*.

Open account, an account which is not in balance, *i.e.*, an account containing a debit or a credit excess; opposite of *closed account*.

Personal account, an account operated under the name of an individual, an organization or a business enterprise.

Private Account, an account maintained in a Private Ledger. Information of a confidential nature which ought to be shown on the accounting records can best be treated in the private set of accounts.

Real account, an account used in displaying the financial status

THE ACCORDION, ONE OF THE SMALLEST MEMBERS OF THE ORGAN FAMILY, WAS INVENTED BY DAMIAN, A VIENNESE, IN 1829

of a business. All accounts used in a “balance sheet” are real accounts; thus they represent assets, liabilities and capital.

Simple account, an account containing entries relating to a single class of transactions; opposite of mixed account. Sales returns, purchase allowances, interest on notes receivable and administrative salaries are *simple accounts*. (*See* ACCOUNTANCY AND ACCOUNTANTS, BOOK-KEEPING.)

As a stock exchange term, “account” is used in several senses:—

(1) The periodical settlements occurring, in London, monthly for British Government and a few other first-class securities, and fortnightly for all others.

(2) The period between two settlements. A 19-day account is one in which 19 days elapse between one pay day and another.

(3) The volume or condition of commitments. A speculator is said to have a large account open when he has dealt heavily either for the rise or fall.

An account is also any statement as to acts or conduct, or quite simply any narrative report of events, etc. A further sense-development is that of esteem, consideration. (G. L. C.)

ACCOUNTANCY AND ACCOUNTANTS. Originally, accountancy was the same thing as account-keeping or bookkeeping, and “accountant” and “bookkeeper” were interchangeable terms, but an increasing recognition of the importance of accounting in the development of modern business methods has led here, as elsewhere, to the division of labour. In the early days of navigation it was doubtless reasonable to assume that the man who navigated a canoe was in all probability also the man who designed and constructed it: to-day, the distinctions between the engineer officer, the naval architect and the shipbuilder are clearly defined and well recognized. Much the same process of evolution has been going on in the accountancy world, and although the distinction may not yet be universally accepted, it may be stated that, whereas the bookkeeper is the person who keeps the books or accounting records of an undertaking, the accountant is rather the person who decides how such records ought to be kept. The term accountancy is now generally applied to all the work that falls to the lot of the accountant, although under modern conditions (as is shown later on) that work is now exceedingly varied and often extends far beyond the region of accounts.

Early History.—Very little is known of the origin of accountancy as a profession. In the modern acceptation of the word, however, a professional man is one who places his skill and learning at the disposal of all and sundry for a reward, as distinct from one who serves a single employer. Accordingly, while there are several references in mediaeval and even classic times to stewards and auditors, these references do not throw much light upon the origin of professional accountancy, as the persons referred to were manifestly in the whole-time employment of a single individual or body. The first association of accountants of which there is any record is the *Collegio dei Raxonati*, which was founded in Venice in 1581, but it is by no means certain that the members of this body were professional or public accountants, or whether they were not rather employees of public bodies. At Milan, however, in 1742, the Government established a scale of charges for accountants, so it may be assumed that then, if not earlier, professional accountancy (as here defined) actually existed in that city. It has been said that the first Scottish professional accountant was one George Watson, born in Edinburgh in 1645; but whether he was really able to carry on a practice as a professional accountant in addition to his “large private banking business” seems somewhat doubtful. Holden’s *Triennial Directory of London, Westminster and Southwark* was first published in 1799, and contains the names of 11 accountants. The *British Universal Directory*, published in 1790, had given the names of five accountants only. It seems clear, therefore, that there was very little professional accountancy in London before the 19th century, and in the issue of *Holden* for 1822 the number of practising accountants had only risen to 73. Indeed, little progress was made by professional accountancy in Great Britain, or elsewhere, until the middle of the 19th century, when (so far at least as Great Britain is concerned) it received a great impetus from

the growth of limited liability companies, and a little later from the Bankruptcy Act, 1869, which to a very large extent withdrew the administration of insolvent estates from the hands of public officials. The advent of the limited liability company led to business operations being undertaken upon a scale which had formerly not been thought of. The proper control of these large scale operations naturally called for better accounting systems than had formerly been deemed adequate.

Organization.—The first step in the direction of organizing professional accountancy in Great Britain was taken when the *Society of Accountants* in Edinburgh was incorporated by Royal Charter in 1854. Similar societies in Glasgow and Aberdeen were also incorporated by Royal Charter in 1855 and 1867 respectively. Each of these bodies, however, had assigned to it definite geographical limitations, although the individual members of all three may, and do, practise in various parts of the world. The *Institute of Accountants* was formed in London in 1870, was incorporated by Royal Charter in 1880 as *The Institute of Chartered Accountants in England and Wales*, provision at the same time being made for all accountants then practising in England or Wales to become members. *The Society of Incorporated Accountants and Auditors* was registered under the Companies Act in 1885. (For particulars of these and other bodies see ACCOUNTANTS' SOCIETIES.) *The Institute of Chartered Accountants in Ireland* was incorporated in 1888.

Accountancy Elsewhere.—But little development has as yet taken place on the continent of Europe as regards professional accountancy, but professional bodies have existed in Holland, Sweden and Belgium since 1895, 1899 and 1903 respectively. Most British colonies have one or more professional bodies of their own.

Duties.—It has been stated that originally accountants were bookkeepers. Hence, naturally, as soon as the necessity or desirability of checking, criticizing or auditing the records of accounting parties was appreciated, skilled accountants whose probity could be relied upon would naturally be selected for the work. In the first instance, accordingly, professional accountants were in the main auditors of other people's accounts. Where the auditing was not a whole-time job there were obvious economies in securing the services of a professional accountant, while the fact that he was a professional accountant ensured his independence. As, however, the centre of gravity tended to shift in Great Britain from agriculture to industry, the professional accountant found thrust upon him an ever-enlarging sphere of activities over and above his primary function as an expert in accounts. In addition to the audit of the accounts of companies, institutions and private concerns, professional accountants are frequently called upon to design systems of accounting for new or growing concerns; to assist in the establishment of an adequate system of cost accounts; to prepare business statistics; to investigate accounts in connection with partnership changes, the amalgamation of business interests, or the flotation of companies formed to acquire established businesses; to deal with compensation cases on the compulsory purchase of businesses by railway companies or public bodies; to give expert evidence on matters relating to accounts; to prepare accounts for the use of counsel in both civil and criminal proceedings; and to act as arbitrators, umpires or referees in differences relating to matters of accounts or finance. They also very frequently act as secretaries of companies whose operations are not upon a sufficiently large scale to justify a whole-time appointment, and the accounts of executors and trustees under wills and settlements are often kept by professional accountants. In addition, professional accountants act as trustees in bankruptcy; trustees under deeds of arrangement; liquidators of companies; receivers for debenture holders; and managers of businesses where a receiver is in possession of the assets.

Mode of Entering the Profession.—Anyone desirous of becoming an English chartered accountant must first serve under articles with a practising member for five years, or three years in the case of graduates. A premium of from 150 to 500 guineas is usually required. Before signing articles, the pupil must have passed the preliminary examination of the Institute, or some

accepted equivalent of matriculation standard. After half the period of articles has expired, the pupil may submit himself for his intermediate examination in general commercial knowledge, bookkeeping and accounts and auditing; on the termination of his articles, before admission as a member, he must pass his final examination in advanced bookkeeping and accountancy (including costing and taxation); auditing; partnership and executorship law and accounts (including the rights and duties of executors, trustees and receivers); bankruptcy and company law; the principles of mercantile law and the law of arbitrations and awards; and either (a) economics, (b) banking, currency and foreign exchanges or (c) actuarial science. The standard set is a high one, and real ability, as well as hard work, is necessary to secure a pass.

The regulations of Scottish chartered accountants as to admission, etc., are upon similar lines, there being a general examining board which deals with candidates articleed to members of all three bodies. In Scotland as a rule no premium is charged, but no salary is paid during the period of articles. The Institute of Chartered Accountants in Ireland also has similar regulations. The regulations for admission to the Society of Incorporated Accountants and Auditors are also upon somewhat similar lines, save that articles are not always insisted upon when the candidate has had nine years' accountancy experience with a public accountant and has passed the Society's examinations. When articles are entered into, the premium is usually lower than that charged by English chartered accountants.

Statutory Regulations.—In New Zealand and South Africa there are statutory registers of public accountants, and only those upon the register are permitted to undertake certain specified accountancy duties. The registration of professional accountants has been mooted at various times from 1889 onwards, but opinions are so divided as to its desirability that statutory registration in Great Britain seems as far off as ever.

(1897); *Incorporated Accountants' Journal*, vol. i. (1889). (L. R. D.)

United States.—Accountancy, in the United States, is among the newer professions. In the short time of its existence it has not acquired the traditions which characterize such of the older professions as law, medicine and theology. The first formal recognition was given to accountancy in the laws of New York State in April 1896. Since that time all of the States have officially recognized the public accountant by creating the title, certified public accountant (C.P.A.), such title to be granted or awarded to applicants who satisfy the requirements regarding character, education and professional skill of the State in which recognition is sought. While there is still a lack of uniformity among the several States in the matter of requirements, there is a constant tendency toward greater strictness as laws are modified and new legislation enacted.

As indicative of the requirements imposed by State laws, the following summary sets forth the standard maintained by New York State: (a) an applicant for the certificate of certified public accountant must submit evidence that he is over 21 years of age and of good moral character; (b) he must present evidence of the successful completion of four years' work in an approved secondary school, including among his subjects those specified by the State department of education; (c) he must submit evidence of five years' experience in accountancy, at least two of which must have been in the office of a certified public accountant and of no less grade than that of junior accountant; such two years' accounting experience must have been in the office of a certified public accountant in this State or in the office of one residing in another State holding a certificate from such State granted on no lower requirement than that of this State, and he must submit evidence of three years' experience attained prior to his admission to the C.P.A. examination; (d) he must take professional examinations conducted by the State department of education in the following subjects: theory of accounts, auditing,

practical accounting and commercial law. The passing grade in each subject is 75%. A candidate who fails in one subject only may take a subsequent examination in that subject to be given within two years from the date of the examination at which he passed the other three subjects.

In the United States, as in other countries, a high standard of professional ethics is fostered. The accountant acting as custodian of his client's interests must safeguard them in every legitimate way. His service to the client carries with it a strict responsibility to the client which cannot be divided or escaped. Confidences of the client must be held inviolable. The acceptance of contingent fees is frowned upon by members of the profession. As an obligation to the client, the accountant must keep himself informed on current developments in the profession.

Education for accountancy, in the United States, was formally provided for as early as 1881. In that year the Wharton School of Finance and Economy of the University of Pennsylvania was established. In 1898 the University of Chicago opened its College of Commerce and Politics (later known as the School of Commerce and Administration), and the University of California its College of Commerce. Two years later there were established at New York university the School of Commerce, Accounts and Finance; at Dartmouth college the Amos Tuck School of Administration and Finance; and at the University of Vermont, a department of economics and commerce. In the first quarter of the new century business education developed throughout the entire country so that at the opening of the year 1925 about 183 American colleges and universities provided instruction in business. In practically all of these schools, education for accountancy has dominated the business curricula.

See H. R. Hatfield, *Accounting, Its Principles and Problems* (1927); T. A. Budd, *The Interpretation of Accounts* (1927); and H. C. Greer, *How to Understand Accounting* (1928). (J. T. MA.)

ACCOUNTANT-GENERAL, a former official of the court of chancery, whose duties have been transferred to the paymaster-general.

ACCOUNTANTS' SOCIETIES. British law does not in general compel the registration of accountants, but only chartered or incorporated accountants may audit the accounts of municipal corporations, and only accountants who are members of some professional body legally incorporated may appear for clients before the income tax authorities. Usually, however, local authorities and the great British trading bodies employ none but members of the great professional accountants' societies.

The Institute of Chartered Accountants in England and Wales was incorporated by royal charter in 1880, and in 1927 had 7,659 members, of whom all but 3% had qualified by serving under articles and passing examinations. Fellows use the abbreviation "F.C.A."; Associates "A.C.A." The institute has a fine headquarters in Moorgate place, London.

The Society of Incorporated Accountants and Auditors was incorporated in 1885, and in 1927 had over 5,000 members. Its members consist of fellows (F.S.A.A.) and associates (A.S.A.A.). The head office is in Gresham street, London.

Other accountant's societies in the United Kingdom include the Corporation of Accountants, the London Association of Accountants, and the Central Association of Accountants. There are also the chartered institutes of Edinburgh, Glasgow and Aberdeen, and two Irish societies. Scotland led the way, for the Society of Accountants in Edinburgh was formed in 1854.

In the United States, there are societies of certified public accountants (*q.v.*). In addition to the various state societies, there are several important national organizations. The American Society of Certified Public Accountants, and the American Institute of Accountants are comprised of professional accountants. The National Association of Cost Accountants is composed of professional accountants and others whose interests lie in the cost phases of accounting. For information regarding American professional requirements, see ACCOUNTANCY.

The growing complexities of industry, trade and taxation throughout the world have given great importance to the societies, which maintain the standard of the accountants' profession.

ACCOUNT CURRENT, a running account which is likely to extend over an interminable period and which, if balanced, is usually opened again immediately; *e. g.*, a holding company which markets merchandise may have an account current with a subsidiary company which manufactures a product. The entire output of the factory may be turned over to the holding company and periodic charges made for merchandise thus transferred. The holding company may make advances from time to time to cover values received. Thus the account may not be in balance for a considerable time although an accurate statement of debits and credits will always be available in the account current. Merchants who sell on consignment frequently maintain accounts current with their consignees. An account current differs from the usual trade account in that the latter is usually settled at regular intervals, monthly, seasonally or otherwise. (G. L. C.)

ACCOUNT RENDERED, an expression used in referring to an account a statement of which has already been delivered to the customer. In business it is customary, for the purpose of verification, to send to each customer whose account is not in balance a statement showing the debits (charges) and credits for the current period (usually one month). If this balance is not liquidated before the end of the following period, the next statement of account has as its first entry "Account rendered" or "To account rendered" and the unpaid balance is shown. Thus an economy of time results because it becomes unnecessary to include all items arising since the account was last in balance. (G. L. C.)

ACCOUNT SALES, a financial statement rendered by a merchant who has received goods on consignment showing sales, charges (usually commission and guaranty), and a net amount either credited to consignor's account or remitted by cheque. This form of financial statement is used extensively by commission merchants and factors and serves the consignor or principal as a basis for accounting.

ACCOUNTS PAYABLE, in accounting terminology, amounts owed by a business to its creditors and not evidenced by notes, bonds, acceptances or other recognition. Loans from officers or partners of an enterprise should be considered as loans payable rather than accounts payable; creditors accounts with debit balances should be listed as other accounts receivable rather than as a deduction from accounts payable. In its broader sense, the term includes amounts received in advance for merchandise that has not been shipped, rentals received in advance, etc.

ACCOUNTS PAYABLE LEDGER, a subsidiary ledger containing the accounts of creditors. It is a device used to facilitate the book-keeping of a business enterprise. The operation of this type of ledger makes possible a division of labour in an accounting department; the work of posting to creditors' accounts can be carried on independently of the work on customers' accounts and general ledger accounts. The sum of the account balances in the accounts payable ledger should agree with the balance of accounts payable controlling account (*q.v.*) as shown in the general ledger. (See BOOK-KEEPING.) (G. L. C.)

ACCOUNTS RECEIVABLE, in accounting terminology, amounts due to a business by its trade debtors for merchandise sold to them, or for services rendered, on a credit basis. It should be noted that only obligations arising from trade transactions should be included. Loans to officers of a company should be considered as loans receivable rather than accounts receivable; creditors' accounts with debit balances should be considered as an offset against accounts payable rather than accounts receivable. In the preparation of a balance sheet, this term, without qualification, may be assumed to represent items which can be collected within a period usual to the trade or industry of which the business is a part. In its broader sense, the term includes all unsettled claims against debtors which are not represented in the form of promissory notes or trade acceptances. (G. L. C.)

ACCOUNTS RECEIVABLE LEDGER, a subsidiary ledger containing the accounts of customers. In a business organization which sells on credit to many customers, it is impracticable to keep customers' accounts in the general ledger. The necessity of having several clerks posting the accounts at the same time makes a segregation imperative. An additional advantage lies in the greater ease with which errors can be localized. In a small business with a limited number of accounts, one accounts receivable ledger will suffice; in a larger business involving many thousands of accounts, 15 or 20 customers' ledgers may be required. The grouping of accounts is usually arranged on an alphabetical basis; e.g., if two such ledgers are used, one would contain accounts of customers whose names start with letters from A-K, and the other, L-Z. Sometimes the grouping is arranged on a territorial basis; e.g., a separate ledger might be kept for the customers served by each branch office of a business, in which case the names would be arranged alphabetically in each ledger. The accounts receivable ledger is kept in agreement with the general ledger by means of controlling account (*q.v.*); the total of the balances of customers' accounts should agree with the balance in the controlling account. Ordinarily, a separate controlling account is kept for each accounts receivable ledger. (See BOOK-KEEPING.) (G. L. C.)

ACCOUTREMENT (a French word, probably derived from *à* and *coudre* or *coudre*, an old word meaning one who has charge of the vestments in a church), clothing; apparel; a term used especially, in the plural, of the military equipment of a soldier other than his arms and clothing.

ACCRA, a port on the Gulf of Guinea in 5° 31' N., 0° 12' W., since 1876 capital of the British Gold Coast colony. Population

THE DUTCH FORT CRÈVECOEUR—PART OF ACCRA (BRITISH) SINCE 1871—FROM AN ENGRAVING MADE IN 1746. ACCRA BECAME THE CAPITAL OF THE GOLD COAST COLONY IN 1876

(1927) about 40,000. The name is derived from the Fanti word *Nkran* (an ant), by which designation the tribe inhabiting the district was formerly known. The town grew up around three forts established in close proximity—James (British, named after James II.), Crèvecoeur (Dutch) and Christiansborg (Danish). The last-named was ceded to Britain in 1850, Crèvecoeur not till 1871. Accra preserves the distinctions of James Town, Ussher Town and Christiansborg, indicative of its tripartite origin. Ussher Town represents Crèvecoeur, the fort being renamed after H. T. Ussher, administrator of the Gold Coast (1867-72). Christiansborg, the finest of the three forts, is the official residence of the governor of the colony; James Fort is a prison. The main thoroughfare, where stand the church of the Holy Trinity (built 1895),

banks and business premises, runs two miles in a straight line. In Victoriaborg, a suburb of Ussher Town, are the residences of the principal officials, and here a racecourse has been laid out. (Accra is almost the only point along the Gold Coast where horses thrive.) Accra has many schools and hospitals and five miles north is Achimota college (opened 1927), the chief educational establishment in the Gold Coast. Accra is connected by cable with Europe and South Africa, and is the sea terminus of a railway to Kumasi. Ships anchor about a mile off-shore and lighterage is by surf boat. There is a breakwater and jetty with wharves. Accra has a wireless telegraph station.

ACCRETION, an addition to that which already exists; increase in any substance by the addition of particles from the outside. In law, the term is used for the increase of property caused by gradual natural additions, as on the seashore or on a river bank or by the formation of a riverine island. (See ALLUVION.)

ACCRINGTON, municipal and parliamentary borough, Lancashire, England, 23m. N. by W. of Manchester, on the London Midland and Scottish railway. Population (1891) 38,603; (1931) 42,973. It lies in a deep valley on the Hindburn, a feeder of the Calder.

Accrington (Akerenton, Alkerington, Akerington) was granted by Henry de Lacy to Hugh, son of Leofwine, in Henry II.'s reign, but came again into the hands of the Lacys, and was given by them (*c.* 1200) to the monks of Kirkstall, who converted it into a grange. It returned to the Lacys in 1287, was granted in parcels, and like their other lands became merged in the duchy of Lancaster. In 1836 Old and New Accrington were merely straggling villages with about 5,000 inhabitants. By 1861 the population had grown to 17,688 owing to the railway junction, and it increased with the rapid development of the Lancashire coalfield. Cotton spinning and printing works, cotton-mill machinery works, dye-works, collieries and transport work employ the people. The church of St. James dates from 1763. The original chapel was probably an oratory which was an offshoot of Kirkstall Abbey. Ecclesiastically, Accrington was dependent on Altham till after the middle of the 19th century. The charter of incorporation is of 1878. The borough is under a mayor, eight aldermen and 24 councillors. Together with the urban districts of Church, Clayton-le-Moors and Oswaldtwistle, Accrington returns one member to parliament. Area of municipal borough 3,427 acres.

ACCRUED DIVIDENDS, the amount of the dividend on a stock which may be presumed to have been earned during the period between the last dividend payment and a later stipulated date. Of course such an accrual of dividend is a mere presumption since dividends are necessarily uncertain until at the end of a dividend period it has been ascertained that there is a surplus from which to pay one, and it has been duly declared. It is quite unusual to sell stock for a certain price "plus accrued dividends," although in the cases of stock with dividend guaranteed (*see* STOCK) or in cases of preferred stock of companies in which the dividend is practically certain, it is sometimes done. Stocks are not sold "with accrued dividend" on organized exchanges, although it is the common custom to sell bonds "with accrued interest" (*q.v.*). The term accrued dividend must not be understood to carry intimation that dividends are in arrears (*q.v.*), that idea being conveyed by the expression "cumulated dividend" or "accumulated dividend" (*q.v.*). (See DIVIDEND.) (J. H. B.)

ACCRUED EXPENSES, costs which have accumulated but which have not been paid or formally entered in the accounting records. Such items ordinarily are not represented by formal claims against a business and hence are not included in accounts payable. Thus, in determining operating costs for a given period, one must consider not only the expenses which have already been entered in the accounts but also any additional expenses applicable to the period but as yet unentered. Thus compensation owed to an employee for services performed since the last date of payment, rent owed to the property owner, interest on moneys borrowed, etc., are in the nature of accrued expenses (*see* INTEREST, DIVIDEND). (G. L. C.)

ACCRUED INCOME, revenue which has been earned but which has not been received or formally entered in the accounting records. In the preparation of a financial statement of income for a given period of time, such amounts must be considered if an accurate result is to be obtained. Thus income represented by rents on leased property must be accrued to date of statement, even though such rents are not due from tenants and will not be paid until a later date. Similarly, interest on notes receivable and on loans receivable must be calculated and applied to the accounting period in which such income is earned. (See **INTEREST, DIVIDEND**.) (G. L. C.)

ACCRUED INTEREST, the amount of interest on a bond which has been earned over the period from the date of the last interest payment to some specified date, but which will not be paid by the issuer of the bond until the next regular interest date. Bonds are almost invariably sold at a certain price plus accrued interest. Thus if the interest dates on a certain bond are Feb. 1 and Aug. 1, and the bond is sold on May 1, the buyer will pay the seller the stipulated price plus the interest for the three months during which the seller's money has been invested in the bond, and on Aug. 1 he will receive from the issuing corporation the full six months' interest for the period from Feb. 1 to Aug. 1. Half of this interest will repay the buyer for the accrued interest which he paid to the seller, and the other half will be the interest for the three months during which his own money was invested in the bond. By specific agreement or notification bonds may be sold "flat," *i. e.*, without considering any accrued interest. Defaulted bonds and income bonds are usually sold flat since the interest to be received from them, if any, is always problematical. (See **BOND**.) (J. H. B.)

ACCUMULATED DIVIDEND, dividend on cumulative stock which was due but was not paid during one or more previous dividend periods. Such unpaid back dividends accumulate and it is essential that it be paid in full before any dividend can legally be paid on the common stock. (See **CUMULATIVE PREFERENCE SHARE, DIVIDEND**.)

ACCUMULATION, in law, the continuous adding of the interest of a fund to the principal, for the benefit of some person or persons in the future. Previous to 1800 this accumulation of property was not forbidden by English law, provided the period during which it was to accumulate did not exceed that forbidden by the law against perpetuities; *viz.*, the period of a life or lives in being, and 21 years afterwards. In 1800, however, the law was amended in consequence of the eccentric will of Peter Thellusson (1737-97), an English merchant, who directed the income of his property, consisting of real estate of the annual value of about £5,000 and personal estate amounting to over £600,000, to be accumulated during the lives of his children, grandchildren and great-grandchildren, living at the time of his death, and the survivor of them. The bequest was held valid (*Thellusson v. Woodford*, 1798, 4 Vesey, 237).

To prevent such a disposition of property in the future, the Accumulations Act, 1800 (known also as the "Thellusson Act") was passed, by which (as altered and re-enacted by the Law of Property Act, 1925) it was enacted that no property should be accumulated for any longer term than either (1) the life of the grantor or settlor; or (2) the term of 21 years from his death; or (3) during the minority of any person living or *en ventre de sa mère* at the time of his death; or (4) during the minority of any person who, if of full age, would be entitled to the income directed to be accumulated. The act does not extend to any provision for payment of the debts of the grantor or of any other person, nor to any provision for raising portions for the children or remoter issue of the settlor, or any person interested under the settlement, nor to any direction touching the produce of timber or wood. It does not apply to property in Ireland. The act has been amended by the Accumulations Act, 1892, which forbids accumulations for the purpose of the purchase of land for any longer period than during the minority of any person or persons who, if of full age, would be entitled to receive the income. The Accumulations Act, 1800, was applied to heritable property in Scotland by the Entail Amendment Act, 1848, and

the saving clause as to provision for payment of debts was dis-applied to Scotland by the Entail (Scotland) Act, 1914. The Accumulations Act, 1892, applies to Scotland.

(See also **TRUST AND TRUSTEES**.)

ACCUMULATIVE STOCK: see **CUMULATIVE STOCK**.

ACCUMULATOR (STORAGE CELL). In the case of a voltaic electrical battery or primary cell, the progress of a chemical reaction or series of reactions is utilized for the production of an electric current, and on completion of the chemical changes, the efficiency of the battery may be restored by renewing the electrodes and electrolyte. With an accumulator or secondary cell, on the other hand, the change of chemical into electrical energy is a reversible process and, by applying an electric current to the cell, the chemical substances involved in the reaction are restored to their original condition. Theoretically any reversible cell can be used as an accumulator of electrical energy. Cells of practical importance to which this article is limited are the lead-acid cell and the nickel-iron alkali cell. The former of these is based on the changes which metallic lead and its compounds undergo in dilute sulphuric acid by the action of the current. The accumulator

FIG. 1.—ACCUMULATOR DEvised BY R. L. G. PLANTÉ, A FORERUNNER OF THE MODERN STORAGE CELL

devised by Planté in 1859, consisted of two sheets of lead separated by strips of rubber and rolled in the form of a spiral. After repeatedly charging and discharging with occasional reversals of polarity the capacity of the cell is gradually built up, one plate acquiring a coating of spongy lead and the other one of lead peroxide (fig. 1).

In 1881 Faure¹ devised a process for pasting on the plates compounds of lead which could be more easily formed into the active materials of the cells. A marked increase in the capacity over the Planté cell was thus obtained, but the adherence of the active material to the plates proved to be unsatisfactory. The numerous types of cells now in use differ principally in the manner in which these active masses of spongy lead and lead peroxide are produced and retained in the electrodes. Volckmar in 1881 introduced the use of lead plates provided with perforations which were filled with a mass of pulverized lead. Swan² devised a grid of cellular structure to act as support for the active material. The Correns grid patented in 1888 consists of a double lattice or mesh work of intersecting ribs of triangular cross section with the apexes pointing inwards so as to form rectangular spaces into which the paste is pressed.

Modern Types of Construction.—With the positive plates, the grids also play an important part in conducting and distributing the current, since the resistivity of lead peroxide is as high as 5.6 to 6.8 ohm cms. or some 300,000 times that of pure lead. At the present time, the metal used for the construction of grids consists of an alloy of lead with about 7% of antimony. The alloy is more resistant against electro-chemical corrosion than pure lead and does not lose its strength as a support by being attacked as the battery is used. Further on moulding the grids the alloy enables the production of sharper castings through the property of the molten alloy of expanding slightly in solidifying and it has the further advantage over lead of a lower temperature coefficient of expansion. The grids for positive and negative plates are frequently of a similar construction though the negative grid may be lighter on account of the higher conductivity of its filling and of its being less subject to corrosion. The paste most commonly used as a filling for the grids consists of litharge, PbO, or red lead, Pb₂O₃, or a mixture of the two. The mixture is made into a stiff paste with sulphuric acid, when a reaction occurs which leads to a binding together or cementing of the material on account of the formation of lead sulphate and peroxide in accordance with the equation:—

¹*Electrician*, vi. 323; vii. 122, 249.

²*Electrician*, 1882, viii. 142, Brit. Pat. 2272, 1881.

The pasted plates are allowed to dry and then alternately oxidized and reduced by electrolysis in dilute sulphuric acid or a sulphate solution. By the process known as "formation" the plates which are designed for the positives are made the anode in the forming tank and the plates for the negatives are made the cathode. It is impracticable and undesirable to remove the last trace of lead sulphate. Formation by this process usually requires

BY COURTESY OF CHLORIDE ELECTRICAL STORAGE CO., LTD.

FIG. 2.—THE ROSETTE POSITIVE PLATE HAS CIRCULAR PERFORATIONS INTO WHICH ARE PRESSED ROSETTES OF CORRUGATED PURE LEAD TAPE

several days to complete when the paste of the negatives becomes reduced to metallic lead and that of the positives oxidized to peroxide.

The Planté type of plate which is largely used for positives may consist of a lead plate provided with deep grooves or thin vertical laminations strengthened at intervals by horizontal binding ribs. In a further modification, the Rosette positive plate (fig. 2), the plate is provided with circular perforations into which are pressed rosettes of corrugated pure lead tape. These rosettes provide the active material, and during the process of formation they expand in the holes in the grid.

A form of plate employed extensively for the negatives of stationary batteries is the box type (fig. 3).

This consists of a hard lead alloy frame cast in two halves, each having an outer face of finely perforated sheet lead and a grid cast on the inner face. The active material is inserted into the box or cages formed by placing the two halves of the grid against each other, after which the latter are riveted together. This device enables the use of spongy lead in a loose form which would not be retained by an open grid. This type of plate is not, however, suitable for light portable cells on account of the extra weight and thickness of the plates.

The Planté type of plate is used almost exclusively for the positives of modern cells for general purposes where weight is not the main consideration but for negatives this type of plate has been practically entirely superseded by other designs which employ the Faure system of the pasted plate. The life of a pasted positive is short compared with a Planté plate but for most purposes this disadvantage is compensated by its greater capacity for a given weight, and the pasted type of positive is in general use for every kind of portable cell, such as those employed for car lighting and starting, electric vehicles and tram lighting.

The accumulator or battery is completed by assembling in juxtaposition a group of the positive plates with a suitable parallel spacing. The plates are secured by burning the projecting lugs on the top surface to connecting bars of lead or lead-antimony

alloy. A group of negative plates are arranged in the same manner, with the projecting lugs on the side opposite to the lugs of the positives. The two groups are interleaved, the positive and negative groups alternating. Actual contact between plates of opposite polarity is prevented by the insertion of a suitable type of separator.

The types of separators used include grooved boards of wood, glass, rubber or celluloid which secure the plates along their edges or else thin perforated diaphragms of hard rubber which are connected between the plates and prevent short circuiting through buckling of the plates or the formation of metallic connection through scaling or "sprouting" from the electrodes. An improved design of separator is described by M. Wilderman¹. In this method use is made of a porous form of ebonite which is moulded from powder and mounted in a frame of solid ebonite. By means of electro-osmotic action, liquid is drawn through the pores of the diaphragm during the charge or discharge of the cell and the circulation of electrolyte on the surfaces of the plate is thus promoted. The increase in the diffusion of free acid brought about by this automatic mixing and circulation of the electrolyte between the electrodes improves the performance of the cell by raising the capacity at a given discharge rate. The frame of the diaphragm which fits closely in between the plates prevents at the same time their buckling and bending. The assembled plates are then mounted in the containing vessel composed of glass, celluloid, hard rubber or lead-lined wood and an electrolyte of a solution of sulphuric acid in water added. The complete cell is always arranged so that the outside or end plates are negative. The cells are connected in series for which purpose the positive bar of each cell is joined by burning or bolting to the negative bar of the next cell in the series.

The electrolyte employed for lead batteries consists of a dilute solution of sulphuric acid. For stationary batteries of low discharge rate, a solution of density 1.20 to 1.23 is employed, corresponding to 28-32% by weight of acid in solution while for

BY COURTESY OF CHLORIDE ELECTRICAL STORAGE CO., LTD.

FIG. 3.—A FORM OF PLATE KNOWN AS THE BOX TYPE IS USED EXTENSIVELY FOR THE NEGATIVES OF STATIONARY BATTERIES

portable batteries and those of high discharge rate such as employed in starting, and truck and tractor batteries, a solution of density 1.27 to 1.30 is employed corresponding to 36-40% by weight of acid in solution. In hot climates acid of lower concentration is required on account of the increased rate of chemical action.

Chemical Characteristics of the Lead Accumulator.—A feature of the lead accumulator is that the reacting lead com-
¹*Chem. Ind.* 1927, xlv. 51.

pounds and products are highly insoluble in the electrolyte; the only change which is produced in the electrolyte during charging and discharging is consequently a variation in the concentration of sulphuric acid. This change in concentration is brought about both through the formation of lead sulphate and through the production of water by the reaction attending the discharge, and conversely, the production of sulphuric acid and loss of water from the electrolyte.

The mechanism of the action of the lead accumulator during the charging is most satisfactorily explained by the "double sulphate" theory first put forward by Gladstone and Tribe in 1882. This theory accounts most directly for the observed formation of lead sulphate at the electrodes and the fall in concentration of sulphuric acid during discharge. The total chemical change occurring during the operation of the cell is accordingly expressed by the equation:

the reaction proceeding from left to right during discharge and conversely from right to left during charge. During the discharge, both the lead peroxide of the positive and the lead of the negative plate are thus transformed into lead sulphate, and sulphuric acid is removed from, and water added to, the electrolyte. During the charge, lead sulphate is oxidized at the anode to lead peroxide and reduced to lead at the cathode, in both cases with liberation of sulphuric acid to the electrolyte while loss of water occurs by electrolytic decomposition. A cell is fully charged when the plates regain their original condition and the passage of the current produces no further change in the active materials which consist of lead peroxide and spongy lead respectively. When current is passed beyond this stage "gassing" results at both plates due to the liberation of free hydrogen which occurs at the cathode and oxygen at the anode. The free "gassing" at both plates and the attainment of a maximum of specific gravity of the electrolyte are indications of the completion of charging.

Theory of the Electrical Changes.—During discharge of the cell the reactions at the electrodes which lead to the production of current may be represented as follows: At the negative electrodes the finely divided lead on account of its solution pressure exerts a tendency to assume the ionic condition, whereby each atom of lead acquires two positive charges, the corresponding negative charge being imparted to the electrode, charging this to a definite potential. The phenomenon may be expressed by the equation $\text{Pb} = \text{Pb}^{++} + 2\ominus$ and proceeds until the magnitude of the potential charge acquired by the negative electrode counterbalances the tendency of the lead to ionize when further action ceases. In the electrolyte the lead ions encounter oppositely-charged ions of SO_4^{--} . Interaction between these ions takes place to give an equilibrium represented by the equation $\text{Pb}^{++} + \text{SO}_4^{--} \rightleftharpoons \text{PbSO}_4$. In accordance with this equilibrium, when the product of the concentration of the Pb^{++} and SO_4^{--} ions reaches a definite value known as the solubility product, separation of solid lead sulphate occurs on the electrode.

At the positive pole, according to a theory of Le Blanc, lead peroxide passes into solution in the form of hydrate $\text{Pb}(\text{OH})_4$ which dissociates to give tetravalent lead ions, Pb^{++++} and OH^- . The concentration of these ions is determined by their solubility product in accordance with the relation

$$C_{\text{Pb}^{++++}} \cdot C_{(\text{OH}^-)_4} = k,$$

C is the concentration and k is a constant. The Pb^{++++} ions may also be regarded as entering into equilibrium with the SO_4^{--} ions to form $\text{Pb}(\text{SO}_4)_2$. This compound can only be present at a very low concentration and exerts a tendency to lose two positive charges and change to bivalent lead, or $\text{Pb}^{++++} \rightarrow \text{Pb}^{++} + 2\oplus$. The positive charge is delivered to the outside circuit and the bi-valent lead then reacts to form lead sulphate as at the negative pole and the lead peroxide of the positive is thus gradually replaced by solid lead sulphate. A further chemical reaction which accompanies the above changes during the discharge of the cell is the combination of H^+ ions formerly associated with SO_4^{--} and the OH^- ions from the lead tetrahydrate, to form water. The complete

reactions which take place during the discharge can be expressed by the following scheme:—

At the negative pole lead sulphate dissolves to a certain extent and dissociates to Pb^{++} and SO_4^{--} ions and on the application of an external potential more negative than the cell the charges on the Pb^{++} ions are neutralized and the atoms are deposited on the electrode as solid lead, while the accompanying SO_4^{--} ions migrate towards the positive pole. At the positive pole the bi-valent lead ions acquire a further charge and are changed into tetravalent ions which then react with water in accordance with the following reactions:—

The tetravalent lead may alternatively be regarded as first forming lead bisulphate with the free SO_4^{--} ions. The lead bisulphate reacts as follows:—

The total change in the cell during discharge may accordingly be represented by the scheme:—

and conversely, during the charge the reaction is represented by the table:—

Liebenow (*Zeit. Elektroch.*, ii., 420, 653 (1895)) developed a somewhat different theory to explain the reactions taking place in the lead accumulator. This is based on the assumption that a solution of lead sulphate contains, in addition to Pb^{++} and SO_4^{--} ions, a certain quantity of PbO_2^{--} ions, formed by the union of Pb^{++} with O^{--} ions of the water, or else by hydrolysis, thus $\text{Pb}^{++} + 2\text{H}_2\text{O} = \text{PbO}_2^{--} + 4\text{H}^+$.

At the positive electrode, lead peroxide passes into solution as PbO_2^{--} , imparting two positive charges to the electrode. This then reacts with the H^+ ions of the acid as follows:—

The lead ions combine with the SO_4^{--} ions of the acid to form the solid sulphate

At the negative electrode, the change consists in the passing of lead into the ionic condition and then combining with a SO_4^{--} ion to form solid sulphate as represented by the Le Blanc theory.

During charging the reverse action occurs, *i.e.*, at the positive pole, PbO_2^{--} ions and at the negative Pb^{++} ions are precipitated from solution. The ions in solution are furnished by the PbSO_4 , accumulated at the electrodes.

Influence of Impurities in the Electrolyte on the Operation of the Cell.—On account of the deleterious action of most impurities, distilled water only should be used in the preparation of the electrolyte. Rain water, if uncontaminated, may be em-

ployed. The influence of different impurities on the action of the cell has been investigated by G. W. Vinal and F. W. Altrup¹ who ascertained, by periodic weighings of the plates, the amount of formation of lead sulphate which results from the discharge of either the positive or negative plates in sulphuric acid. A certain amount of lead sulphate is formed as the result of local action when the plates are immersed in even the purest acid solutions

FIG. 4.—RELATIVE CONDUCTIVITY OF ALL THE STRENGTHS OF SULPHURIC ACID SOLUTIONS

obtainable. Detrimental impurities may act in the following ways: (1) by corroding the plate, (2) by accelerating the formation of lead sulphate or (3) by being deposited in the pores of the plates. It was found that electrolyte, containing only one part of platinum in ten million parts of solution, increased the local action at the negative plates by 50%. A metal of this type is mainly harmful in destroying the "overvoltage" of the cell on which its stability depends. The potential difference between the charged accumulator plates is greater than the value normally required to decompose the electrolyte with the liberation of hydrogen and oxygen. The fact that this reaction does not occur and lead to the discharge of the cell on standing is due to the high overvoltage or passivity exerted by the electrodes to the evolution of these gases. In the presence of a highly electro-negative metal this overvoltage effect is destroyed.

Copper, like platinum, deposits on the negative plate, but produces less effect. Iron in the ferric condition is reduced to the ferrous condition at the negative plate and then is oxidized to the ferric condition at the positive plate, and also to some extent by the air. The action of iron on the negative plates is much more pronounced than on the positives and the local action produced is in excess of the amount which would be calculated from the reduction of the ferric sulphate. Manganese deposits as peroxide upon the positive plates, and produces serious effects. It covers the active material of the plate, closes the pores and causes a large amount of charging current to be wasted as gas.

ELECTRICAL CHARACTERISTICS

Accumulators in Repose.—Accumulators contain only three active substances—spongy lead on the negative plate, spongy lead peroxide on the positive, and dilute sulphuric acid between them. Sulphate of lead is formed on both plates during discharge and brought back to lead and lead peroxide again during charge and there is a consequent change in the strength of acid during every cycle. The chief properties of these substances are shown in the Table.

¹Jour. Amer. Instit. Elect. Eng. 1924, xliii. 709.

TABLE

Substance.	Colour.	Density.	Specific resistance.
Lead	Slate blue	11.3	0.0000195 ohm.
Peroxide of lead	Dark brown	9.28	5.6 to 6.8 "
Sulphuric acid after charge	Clear liquid	1.210	1.37 ohm.
Sulphuric acid after discharge	"	1.170	1.28 "
Sulphuric acid in pores	"	below 1.03	8.0 "
Sulphate of lead.	White	6.3	non-conductor

The curve in fig. 4 shows the relative conductivity of all the strengths of sulphuric acid solutions, and by its aid and the figures in the preceding table, the specific resistance of any given strength can be determined.

The lead accumulator is subject to three kinds of local action. First and chiefly, local action on the positive plate because of the

FIG. 5.—THE EFFECT OF THE STRENGTH OF THE SULPHURIC ACID ON THE ELECTROMOTIVE FORCE

contact between lead peroxide and the lead grid which supports it. In carelessly made or roughly handled cells this may be a very serious matter. It would be so in all circumstances if the lead sulphate formed on the exposed lead grid did not act as a covering for it. It explains why Planté found "repose" a useful help in "forming" and also why positive plates slowly disintegrate; the lead support is gradually eaten through. Secondly, local action on the negative plate when a more electro-negative metal settles on the

FIG. 6.—THE RATE OF DIFFUSION FROM PLATES SOAKED IN ACID OF 1.175 DENSITY AND THEN PLACED IN DISTILLED WATER

lead. This often arises when the original paste or acid contains metallic impurities. Similar impurity is also introduced by scraping copper wire, etc., near a battery. Thirdly, local action due to the acid varying in strength in different parts of a plate. This may arise on either plate and is set up because two specimens of either the same lead or the same peroxide give an e.m.f. when placed in acids of different strengths. J. H. Gladstone and W. Hibbert found that the e.m.f. depends on the difference of strength (*Jour. Inst. Elect. Eng.* 1892). The observations with very strong acid were difficult to obtain. C. Hein (*Elek. Zeit* 1889), F. Strienz (*Ann.*

Phys. Chem. xvi. 449) and F. Dolezalek (*Theory of Lead Accumulators*, p. 55) have also given tables.

It is only necessary to add to these results the facts illustrated by the following diffusion curves, in order to obtain a complete explanation of the behaviour of an accumulator in work. Fig. 6 shows the rate of diffusion from plates soaked in acid of density 1.175 and then placed in distilled water as described in a paper by R. Duncan and H. Weigand (*Elec. World* N.Y. 1889), who were the first to show the importance of diffusion. About one half the acid diffused out in 30 minutes, a good illustration of the slowness of this process. The rate of diffusion is much the same for both positive and negative plates, but slower for discharged plates than for charged ones.

The influence of diffusion on the electromotive force is illustrated by fig. 7. A cell was prepared with 20% acid. It also held a porous pot containing stronger acid, and into this the positive plate was suddenly transferred from the general body of liquid. The e.m.f. rose by diffusion of stronger acid into the pores. Curve I. in fig. 7 shows the rate of rise when the porous pot contained 34% acid, curve II. was obtained with the stronger (58%) acid. Of these two curves the first is more useful because its conditions are nearer those which occur in practice.

At the end of a discharge it is a common occurrence for the plates to be standing in 25% acid, while inside the pores the acid may not exceed 8% or 10%. If the discharge is stopped, we have conditions somewhat like fig. 7 and the e.m.f. begins to rise and increases by about 0.08 volt in one minute.

In examining the effect of repose on a charged cell, Gladstone and Tribe's experiments show that peroxide of lead lying on its lead support suffers from local action, which reduces one molecule of PbO_2 to sulphate at the same time that an atom of the grid below it is also changed to sulphate. There is thus not only a loss of the available peroxide but a corrosion of the grid or plate. It is through this action that the supports gradually give way. On the negative plate an action arises between the finely divided lead and the sulphuric acid, with the result that hydrogen is set free:—

• This involves a diminution of available spongy lead, or loss of capacity, occasionally with serious consequences. In the discharge it becomes sulphated in excess since the better positive maintains the e.m.f. too long. In the succeeding charge, the positive is fully charged before the negative and the differences between them tend to increase in each cycle.

Charge and Discharge.—The most important practical considerations with an accumulator are:—its maximum rate of working; capacity at various discharge rates; efficiency; and length of life. Apart from mechanical injury all these depend primarily on the construction of the cell, and then on the method of charging and discharging. For each type and size of cell there is a normal maximum discharging current. Up to this limit any current may be taken; beyond it, the cell may suffer if discharge be continued for any appreciable time. The most important point to attend to is the voltage at which discharge will cease. The potential difference at terminals must not fall below 1.80 volt during discharge at ordinary rates (10 hours) or 1.75 to 1.70 volt for 1 or 2 hour rate. These voltages indicate that the acid in the pores is not being renewed fast enough, and that if the discharge continues the chemical action will change: sulphate will not be formed *in situ* for want of acid. Any such change in action is inimical to reversibility and therefore to life and constancy in capacity. Thus when at low discharge rates the voltage is 1.80 volt, the acid in the pores has weakened to a mean value of about 2.5% (see fig. 5) which is quite consistent with some part of the interior being practically

FIG. 7.—THE INFLUENCE OF DIFFUSION ON THE ELECTROMOTIVE FORCE

pure water. With high discharge rates, as much as 0.1 volt may be lost in the cells by ordinary ohmic fall, so that a voltage reading of 1.75 corresponds to an e.m.f. of a little over 1.8 volt, and a very weak density of the acid inside the pores. Guided by these figures an estimate can be made of the permissible drop in terminal volts for any given working conditions.

Fig. 8 shows a typical discharge curve. Noteworthy points are: (1) at the beginning and at the end there is a rapid fall in P.D. with an intermediate period of fairly uniform value, (2) when the P.D. reaches 1.6 volt the fall is so rapid that there is no advantage in continuing the action. When the P.D. had fallen to 1.6 volt the cell was automatically switched into a charging circuit, and with a current of 9 amperes yielded the curve in fig. 9. Here again there is a rapid variation in P.D. (in these cases a rise) at the beginning and end of the operation. The cells were now carried through the

FIG. 8.—CHANGE IN ELECTROMOTIVE FORCE WITH TIME OF DISCHARGE

same cycle several times, giving almost identical values for each cycle. After some days, however, they became more and more difficult to charge, and the return on discharge was proportionately less. It became impossible to charge up to a P.D. of 2.4 volts, and finally the capacity fell away to half its first value. Examination showed that the plates were badly scaled, and that some of the scales had partially connected the plates. These scales were removed and the experiments resumed, limiting the fall of P.D. to 1.8 volt. The difficulties then disappeared, showing that discharge to 1.6 caused injury that did not arise at a limit of 1.8. Before describing the new results it will be useful to examine these two cases in the light of the theory of e.m.f. already given. (a) At the moment when previous charging ceases the pores of the positive plate contain strong acid, brought there by the charging current. There is consequently a high e.m.f. But the strong acid begins to diffuse away at once and the e.m.f. falls rapidly. Even if the cell were not discharged this fall would occur, and if it were allowed to rest for 30 minutes or so the discharge would have begun with the thin line (fig. 8). (b) The pores being clogged by sulphate, the peroxide cannot acquire acid by diffusion, and when 5% is

FIG. 9.—CHANGE OF ELECTROMOTIVE FORCE WITH TIME OF CHARGE

reached the fall in e.m.f. is disproportionately large (see fig. 5). If discharge is stopped, there is an almost instantaneous diffusion inwards and a rapid rise in e.m.f.

Capacity of the Cell.—A knowledge of the capacity of the cell for storing electric energy is of great importance, and is readily determined by allowing a regulated current from a fully-charged cell to pass through a recording ammeter or copper voltmeter until the voltage has fallen to about 1.8 volt. The product of the amount of current in amperes by the length of time in hours gives the capacity of the accumulator in ampere-hours. The rate

of discharge must be noted, as the capacity varies somewhat with the rate at which current is taken from the cell.

In fig. 10 diagrams are given of two types of chloride cells showing the curves of voltages during charges following 5-hour discharges, and curves for discharges at 1, 3, 5 and 10 hour rates.

Current and Energy Efficiencies.—The current or ampere-hour efficiency is the ratio of amp. hours yielded during discharge to the amp. hours required to restore it to its original value by charging. In practice, a current efficiency of 90–95% is normally obtained under working conditions. The energy or watt-hour

BY COURTESY OF CHLORIDE ELECTRICAL STORAGE CO., LTD.

FIG. 10.—VOLTAGES DURING CHARGES FOLLOWING 5-HOUR DISCHARGES AND CURVES FOR DISCHARGES AT 1, 3, 5 AND 10 HOUR RATES FOR TWO TYPES OF CHLORIDE CELLS

efficiency is of the greatest value in gauging the practical results of an accumulator. The watt-hours taken up by a cell during charge or given up during discharge are given by the expression: time (in hours) x amperes x average volts. The watt-hour efficiency is consequently equivalent to the product of the ampere-hour efficiency into the ratio of the average volts on discharge to average volts on charge. The watt-hour efficiency of a cell in practice usually ranges from 72 to 78% and is higher for low than for high rates of charge and discharge.

TYPES OF ACCUMULATORS

The Tudor Cell.—The Tudor accumulator is designed primarily for use as a stationary battery and is suitable for lighting and power requirements generally where a large capacity and high efficiency are required. The positive plates are made of pure lead and cast in one piece with thin vertical ribs and provided with

FIG. 11.—THE ONE-PIECE POSITIVE PLATE OF THE TUDOR CELL

FIG. 12.—THE TWO-PIECE NEGATIVE PLATE OF THE TUDOR CELL

slot-shaped intervening pieces. The ribs are intersected at intervals by shorter horizontal supports to give the plates rigidity in both directions. By means of an improved Planté process an adherent and homogeneous coating of peroxide is formed on the large surface provided by these plates. As the coating of active material on the surface is thin, plates can be charged and dis-

charged at high rates without damage. Each negative plate consists of two lead grids riveted together; stout horizontal and vertical ribs divide the inside space into a number of small compartments which are filled with active material. The sheets of perforated lead on the outer surface of the plates hold the active material in position but at the same time allow free circulation of the acid (figs. 11 and 12).

Each pair of plates is separated either by glass tubes which are held in position by guiding pieces cast on to the lugs of the negative plates, or by wood board separators which have previously been specially treated to remove deleterious matter. In cells with lead-lined wood boxes, glass tubes are also inserted between the end negative plates and the lead lining of the box to prevent the plates coming into direct contact with the lead lining.

The Chloride Cell.—The chloride cell has a Planté positive with a pasted negative. For the positive a lead casting is made, about 0.4in. thick pierced by a number of circular holes about 1/16 in. in diameter. Into each of these holes is thrust a roll or rosette of lead ribbon, which has been cut to the right breadth (equal to the thickness of the plate) then ribbed or gimped and finally

BY COURTESY OF CHLORIDE ELECTRICAL STORAGE CO., LTD.

FIG. 13.—THE POSITIVE PLATE OF THE EXIDE "IRONCLAD" BATTERY

BY COURTESY OF CHLORIDE ELECTRICAL STORAGE CO., LTD.

FIG. 14.—CROSS-SECTION OF THE EXIDE "IRONCLAD" TUBE

coiled into a rosette (cf. fig. 2). The rosettes have sufficient spring to fix themselves in the holes of the lead plate, but are keyed in position by a hydraulic press. The plates are then "formed" by passing a current for a long time. The negative plate consists of a grid with thin vertical ribs, connected horizontally by small bars of triangular section. The bars on the two faces are "staggered," that is, those on one face are not opposite those on the other. The grid is pasted with a lead oxide paste and afterwards reduced; this is known as the "exide" negative.

The larger sizes of negative plate are of the "box" type, formed by riveting together two grids and filling the intervening space with paste (cf. fig. 3).

Exide Ironclad Battery.—This type of battery is designed primarily for use with electric locomotives, trucks, tractors, cranes and other purposes where heavy duty and resistance against vibration are required. The positive plate (fig. 13) is built up of a number of specially shaped antimonial-lead rods held in a vertical plane by top and bottom castings of lead. These rods are surrounded by sheaths, or tubes, of a special class of ebonite in which they stand concentrically, the space between the rod and the tube being filled with active material. (For complete cell see fig. 20.)

In this plate the peroxide of lead used for the active material is so applied that it fills entirely the space round the lead rod and when fully "formed" becomes a close-fitting tube making good contact with the supporting rod. The ebonite tubes are slitted horizontally to allow the electrolyte to gain access to the active material; and, further, they are of an appreciably elastic nature,

and so allow for expansion or contraction of the active material. The slitting of the tubes (figs. 14; 15) is so conducted that no active material can fall out and yet the resistance to the electrolyte is reduced to a minimum. The negative plate is similar to that of the ordinary Exide cell but is made of increased thickness and arranged to have approximately the same commercial life as the positive plate so as to avoid renewals.

Figs. 16, 17 and 18 show the negative plate which consists of a grid of hard antimonial lead supporting and containing strips of active material which is applied to the grid in the form of paste. To prevent contact between the grids through buckling or distortion, thin diaphragms of prepared and treated wood are applied on each side of the positive plate as in fig. 19.

A vehicle battery consists of a number (often 40 to 80) of cells, coupled by connecting straps. At a normal discharge rate of 5 hours the capacity of the large units ranges from 3.5 to 4.8 amp. hours per lb. of cell according to the design. At an average voltage of 2, this corresponds to from 7.0 to 9.6 watt hours per lb. of the active material employed.

Care of Lead Accumulators.—The satisfactory working and durability of batteries depends largely upon the purity of the electrolyte employed in the cells. Only pure brimstone sulphuric acid diluted with distilled water to a specific gravity of 1.200–1.210 at a temperature of 60° F. should be used. Apart from this the following simple rules should be observed:—

1. Never discharge below a potential difference of 1.85 (or in rapid discharge 1.8) volt.
2. Never leave the cells discharged, if it be avoidable.
3. Give the cells a special equalizing charge once a week.
4. Make a periodic examination of each cell, determining its e.m.f., density of acid, the condition of its plates and freedom from growth.

two methods can be adopted. In private installations it may be disconnected and charged by one or two cells reserved for the purpose; or, as is preferable, it may be left in circuit, and a cell in good order put in parallel with it. This not only prevents the faulty one from discharging, but keeps it supplied with a charging current till its potential difference is normal.

Every battery attendant should be provided with a hydrometer and a voltmeter. The former enables him to determine from time to time the density of the acid in the battery. The voltmeter should read up to about three volts. Some form of wooden scraper should be supplied to remove any growth from the plates. The scraping must be done gently, with as little other disturbance as possible. By the ordinary operations which go on in the cell, small portions of the plates become detached. It is important that these should fall below the plates, lest they short-circuit the cell, and therefore sufficient space ought to be left between the bottom of the plates and the floor of the cell for these "scalings" to accumulate without touching the plates, and they should be disturbed as little as possible. The liquid must be kept above the top of the plates. Experience shows the advisability of using distilled water for this purpose. It may sometimes be necessary to replenish the solution with some dilute acid, but strong acid must never be added to the cell.

The chief faults are buckling, growth, sulphating and disintegration. Buckling of the plates generally follows excessive discharge, caused by abnormal load or by accidental short-circuiting. At such times asymmetry in the cell is apt to make some part of the plate take much more than its share of the current. That part then expands unduly, as explained later, and curvature is produced. The only remedy is to remove and press it back into shape as gently as possible. Growth arises generally from scales from one part falling on some other—say, on the negative. In the next charging the scale is reduced to a projecting bit of lead, which grows still further because other particles rest on it. The remedy is, gently to scrape off any incipient growth. Sulphating, the formation of a white hard surface on the active material, is due to neglect or excessive discharge. It often yields if a small quantity of sulphate of soda be added to the liquid in the cell. Disintegration is due to local action, and there is no ultimate remedy. The

BY COURTESY OF CHLORIDE ELECTRICAL STORAGE CO., LTD.
FIG. 19.—ASSEMBLY OF PLATES IN THE EXIDE "IRONCLAD" BATTERY

end can be deferred by care in working, and by avoiding strains and excessive discharge as much as possible.

5. If any cell shows signs of weakness, keep it off discharge till it has been brought back to full condition. See that it is free from any connection between the plates which would cause short-circuiting; the frame or support which carries the plates sometimes becomes covered by a conducting layer. To restore the cell,

High discharge rates are not harmful to a battery in that with a properly designed cell a direct short circuit can be applied across the terminals without doing harm. Generally speaking the life of a battery is cut down more by improper charging than by any amount of discharging at high rates. Discharging at high rates should not be confused with over-discharging at high rates, that is, to continue to take current from a battery after it has become nominally discharged. A battery in a discharged condition, or in an over-discharged condition will sulphate very rapidly, and every effort should be made to prevent a battery from lying in a discharged condition any longer than is absolutely necessary. If a

battery is discharged below 1.76 volts, lead sulphate causes an increase in volume of each of the plates, setting up strains in them and tending to buckle them and cause the active material to crack and drop off. The injurious results at voltages below this value arise because then the pores contain water. The chemical reaction is altered and oxide or hydrate is formed which will partially dissolve, to be changed to sulphate when the sulphuric acid subsequently diffuses in. But formed in this way it will not appear mixed with the active masses in the electrolytic paths, but more or less alone in the pores. In this position it will obstruct the passage and isolate some of the peroxide. Further, when forming in the narrow passage its disruptive action will tend to force off the outer layers.

When cells have been allowed to remain any length of time in a discharged condition, the sulphate becomes very hard and brittle, and when the battery is placed on charge, small quantities flake off and fall to the bottom of the jar. This results in loss of active material and gradual disintegration of the plates. The positive plate is affected to a greater extent than the negative as it has less mechanical strength, consequently positive plates have a shorter life than negative. The more porous the active material the greater depth the acid will penetrate to and the greater will be the capacity of the battery. The current must be distributed equally over the surface of each plate in order to ensure an equal life of all parts, otherwise some portions would be worked more than others.

Accumulators in Central Stations.—As the efficiency of accumulators is not generally higher than 75% and machines must be used to charge them, it is not directly economical to use cells alone for public supply. Yet they play an important and an increasing part in public work, because they help to maintain a constant voltage on the mains and can be used to distribute the load on the running machinery over a much greater fraction of the day. Used in parallel with the dynamo, they quickly yield current when the load increases, and immediately begin to charge when the load diminishes, thus largely reducing the fluctuating stress on dynamo and engine for sudden variations in load.

Regulation of the potential difference is managed in various ways. More cells may be thrown in as the discharge proceeds, and taken out during charge, but this method often leads to trouble as some cells get unduly discharged, and the unity of the battery is disturbed. Sometimes the number of cells is kept constant for supply, but the P.D. they put on the mains is reduced during charge by employing regulating cells in opposition. Both these plans have proved unsatisfactory, and the battery is now prefer-

ably joined across the mains in parallel with the dynamo. The cells take the peaks of the load and thus relieve the dynamo and engine of sudden changes as shown in fig. 21. Here the line current (shown by the erratic curve) varied spasmodically from 0 to 375 amperes, yet the dynamo current varied from 100 to 150 amperes only (see line A). At the same time the line voltage (535 volts normal) was kept nearly constant. In the late evening the cells became exhausted and the dynamo charged them. Extra voltage was required at the end of a "charge" and was provided by a "booster." Originally a booster was an auxiliary dynamo worked in series with the chief machine and driven in any convenient way. It has developed into a machine with two or more exciting coils, and having its armature in series with the cells (see fig. 22). The exciting coils act in opposition, the one carrying the main current sets up an e.m.f. in the same direction as that of the cells, and helps the cells to discharge as the load rises. When the load is small, the voltage on the mains is highest and the

shunt exciting current greatest.

Batteries should be kept free from dirt and corrosion. Terminals should be occasionally removed and covered with vaseline to maintain good contact. Most troubles occur after a battery has finished its useful life, the length of which depends upon the design, the quality of the materials of which it is constructed, the care given to it and the relation of the current put in to that taken out; the useful life of a battery should be from 4 to 5 years. In commercial practice, however, a smaller battery working at a higher rate is generally employed in order to economize in weight, size and cost and the useful life of such a battery is between 1½ and 3 years, in which case the battery requires greater attention.

NICKEL-IRON ALKALINE CELLS

In this type of accumulator which was invented and developed by Edison, the active materials of the electrodes consist of the oxides of iron and nickel which are immersed in an electrolyte of potassium hydroxide.

Construction and Assembly.

The active material of the positive plates is nickel hydrate. As this material is only a poor conductor, its resistance is reduced by mixing with a better conducting material. The means adopted is to fill a helical tube (fig. 23) made from finely perforated nickelled steel strip with alternately-arranged thin layers of nickel hydrate, the positive active material, and fine metallic nickel flake. Each tube is about 4in. long and ¼in. diameter, and contains over 300 of these highly-compressed double layers. Each tube is surrounded and reinforced externally by steel rings equidistantly spaced. The complete positive plate (fig. 24) consists of a light nickelled steel grid on which a double row of the unit tubes already described is mounted. To prevent plate distortion, adjacent tubes are wound oppositely, a right-hand wound tube being mounted adjacent to a left-hand wound one, and so on.

The negative plates of the cell also consist of an assemblage of small units, but of oblong pocket form instead of being tubular. Iron oxide prepared in a special manner, and incorporated with a trace of mercury to improve the conductivity, is enclosed in flat steel pockets, which, like the tubes in the positive plate, are made of nickelled steel strip, finely perforated. These units are mounted in a light, punched,

FIG. 23.—ONE OF THE INDIVIDUAL POSITIVE TUBES OF THE EDISON ACCUMULATOR

nickelled steel frame and subject to hydraulic pressure of 120 tons in order to prevent subsequent loosening and to corrugate the faces of the pockets. The assembled cell consists of a series of positive and negative plates as indicated in fig. 25. Contact between adjacent plates is prevented by hard rubber strips and pin insulators, while sheets of the same material prevent contact of the plates with the sides of the nickel plated steel container.

The terminal posts of the assembled plates project through insulated and liquid-tight stuffing glands or boxes mounted in the welded-in top of the cell which is also provided with a combined filler cap and gravity gas escape non-return valve.

The electrolyte which is employed consists of a solution of potash in distilled water with a small percentage of lithia. The density of the electrolyte does not change to any large degree between charge and discharge. The proper level of the electrolyte in the cell is subsequently maintained by the additions of distilled water.

Electrolytic Reactions.—On first charging the cell, the green nickel hydrate becomes more highly oxidized and becomes black

FIG. 24.—THE COMPLETE POSITIVE PLATE OF THE EDISON BATTERY

FIG. 25.—THE ASSEMBLED EDISON ACCUMULATOR WITH PARTS CUT AWAY TO SHOW THE CONSTITUENT FEATURES OF CONSTRUCTION

in colour, while the iron oxide is reduced to a chemically pure form of iron. Various equations have been proposed to represent the chemical reactions occurring during the operation of the cell. That which most probably holds is the following (change from left

to right represents discharging; that from right to left the charging reaction):—

The material in the positive plate is not homogeneous but consists of mixtures or possibly a solid solution of the different oxides of nickel. On charging, the lower oxides of nickel are brought by the current to a higher degree of oxidation though not completely to NiO_2 on account of the instability of this compound. According to Foerster (*Electrical World* [London] 1922, p. 270) the potential of the fully-charged plate corresponds to that of NiO_2 , when these fall by 0.1 volt to a value at 18°C with a 20% potassium hydroxide solution, of 1.36 volt, corresponding to the oxide Ni_2O_3 . The change occurring during the operation of the cell is thus seen to consist only of a transference of OH^- from the active mass of one electrode to the other. The net effect is thus the transfer of oxygen from one plate to the other. During discharge the electrolyte becomes more concentrated at the nickel or positive plate through the liberation of hydroxyl ions and the concentration falls by the same amount at the negative plate through the combination of hydroxyl ions. The total change of concentration throughout the electrolyte is consequently only that due to the incomplete hydration of the Ni_2O_3 . According to this effect the electrolyte becomes slightly more concentrated on discharge and more dilute on charge.

Voltage, Capacity and Efficiency.—The average working voltage of this cell is 1.2 volts at the normal or 5-hour rate of discharge. The behaviour during charge or discharge is shown in fig. 26. The capacity of the cell is affected only very little by the rate of discharge and amounts to from 7.5 to 12 amp. hours per lb. of assembled battery. The energy capacity amounts to from 8.5 to 15 watt hours per lb. of cell according to the size of cell.

FIG. 26.—THE NORMAL RATES OF CHARGE AND DISCHARGE OF THE EDISON ACCUMULATOR

An output of one h.p. hour can thus be obtained for a weight of 50–60 lb. At the normal rate of charge and discharge the ampere-hour efficiency as rated by the manufacturer is 80%, and the watt-hour efficiency 60%.

The advantages of the Edison over the lead accumulator are its longer life, lighter weight, greater robustness against vibration and its immunity from harm due to standing in a discharged condition, being overdischarged, short circuited or charged in the reverse direction. (J. N. P.)

Dolezalek, *The Theory of the Lead Accumulator* (1906); G. W. Vinal, *Storage Batteries* (New York, 1924); M. Arendt, *Storage Batteries* (1928).

ACCURSIUS (Ital. Accorso), **FRANCISCUS** (1182–1260), Italian jurist, was born at Florence about 1182. A pupil of Azo, he first practised law in his native city, and was afterwards appointed professor at Bologna. He arranged into one body the almost innumerable comments and remarks upon the Code, the Institutes and Digests. This compilation, bearing the title *Glossa ordinaria* or *magistralis*, but usually known as the Great Gloss, though written in barbarous Latin, has more method than that of any preceding writer on the subject. The best edition of it is that of Denis Godefroi (1549–1621), published at

Lyons in 1589. His eldest son, FRANCISCUS (1225-93), who also filled the chair of law at Bologna, was invited to Oxford by King Edward I, and in 1275 or 1276 lectured on law in the university.

ACCUSATION, a legal term signifying the charging of another with wrong-doing, criminal or otherwise. For the accusation of another of a crime or of misconduct for the purpose of extortion, see BLACKMAIL.

ACCUSATIVE, a case of the noun, denoting primarily the object of verbal action or the destination of motion.

ACE, the number one at dice, or the single point on a die or card; also a point in the score of racquets, lawn-tennis, tennis and other court games.

From its conventional use as the highest in a suit in card-games, the word has been employed (in France and elsewhere) to signify an aeroplane pilot of supreme skill and daring.

ACELDAMA (AKELDAMA, R. V.), land (originally a potter's field) said in Matthew to have been bought by the priests for a burial ground for strangers with the money which was returned by Judas, and could not be put into the treasury "because it was the price of blood," Aramaic ܐܪܥܐ ܕܕܡܐ, "the field of blood," Acts i. 19; cf. Matt. xxvii. 8. Acts ascribes its purchase to Judas himself, perhaps by mere compression. Manuscript authority gives AKELDAMACH ('Ακελδαμάχ, Westcott and Hort) "the field of thy blood," which is unsuitable. Klostermann's suggestion *Probleme im Aposteltexte* (1883, pp. 1-8), "the field of sleep" (*dmak*, "he slept," used especially of sleep in death, e.g., Targum of Job. iii. 12, Syr.: *dmaka*, "sleep") is very attractive, suggesting "cemetery," and although there is no other example of such a Jewish title the figure is old (Dan. xii. 2). If so, Akeldama will be only the popular, perhaps Christian, nickname. In any case Acts i. 19 can hardly be as early as St. Peter's speech in which it is incorporated. No plausible explanation is given for "ch" being added to Akeldama, and there is only one exactly parallel case, the mysterious *Sirach* for *Sira* (Ecclus. L. 27 [29]). Tradition from the fourth century places the plot on the Hill of Evil Counsel—"a little level plot overhanging the valley of Hinnom." . . . The potters probably "had here a cave in which their work was carried on." (See Schick, P E F Q. 1892, pp. 283-289.) (A. L. W.)

ACENAPHTHENE, an aromatic hydrocarbon first isolated from coal tar by M. P. E. Berthelot and subsequently synthesized from α -ethylnaphthalene. Crystallizing from alcohol in colourless needles, it melts at 95°C. and boils at 278°. Its formula is $C_{12}H_{10}$. On oxidation with chromic acid it yields (a) acenaphthenequinone employed in the manufacture of ciba scarlet and other red vat dyes; (b) naphthalic acid, a starting point in the production of perylene vat dyes. (See DYES, SYNTHETIC.)

Acenaphthene, which readily undergoes nitration and sulphonation, forms a characteristic orange picrate melting at 161°.

BIBLIOGRAPHY.—A. E. Everest, *The Higher Hydrocarbons* (1927). (G. T. M.)

ACEPHALI (ἀκέφαλοι), a term applied to sects having no head or leader; and in particular to a strict Monophysite sect that separated itself, in the end of the 5th century, from the rule of the patriarch of Alexandria (Peter Mongus), and remained "without king or bishop" till it was reconciled by Mark I. (799-819) (Gr. ἄ, privative, and κεφαλή, head).

See Gibbon, ch. xlvii. (vol. v., p. 129 in Bury's ed.).

ACEPHALOUS, headless, whether literally or metaphorically, leaderless. The word is used literally in biology, and metaphorically in prosody or grammar for a verse or sentence with a beginning wanting. In zoology, the Mollusca are divided into cephalous and acephalous (Acephala), according as they have or have not a head. The Acephala, or Lamellibranchia (*q.v.*), are the bivalve shell-fish. In botany the word is used for ovaries not terminating in a stigma.

ACERENZA (anc. *Acheruntia*), province of Potenza, Italy, the seat of an archbishop, 15½ m. N.E. of the station of Pietragalla, which is 9 m. N.W. of Potenza by rail, 2,730 ft. above sea-level. Pop. (1921) 4,372. Its situation is one of great strength.

ACERRA, town and episcopal see, province of Naples, Italy, 9 m. N.E. from Naples. Pop. (1921) 15,987 (town), 18,200 (commune). The town lies on the right bank of the river Agno, 90 ft. above sea, in a fertile but somewhat marshy district, formerly malarious. It became a city with Latin rights in 332 B.C.; was destroyed by Hannibal (216 B.C.); restored (210); served as Roman headquarters in the Social War (90).

ACERRA, in Roman antiquity a small box or pot for holding incense; also a little altar placed near the dead on which incense was offered every day till the burial. In ecclesiastical Latin, an incense boat.

ACETABULUM, the Latin word for a vinegar cup, an ancient Roman vessel, used as a liquid measure (equal to about half a gill); it is also used in biology for certain cup-shaped parts; e.g., the socket on the hip girdle for the head of the thigh-bone, the receptacle of Fungi, etc.

ACETALDEHYDE or simply "aldehyde," is the second aldehyde (*q.v.*) of the aliphatic series. It occurs in the "first runnings" from alcohol stills, wood spirit, petroleum, etc. It is produced when ethyl alcohol is oxidized and gives acetic acid on oxidation (CH_3CHO). It has a characteristic odour, not unlike ivy leaves.

ACETALS, the ethers (*q.v.*) and esters (*q.v.*) derived from the glycols. (See GLYCOLS.) The aromatic acetals are derivatives of catechol (*q.v.*).

ACETAMIDE: see AMIDES.

ACETANILIDE, also called *antifebrin*, made by the interaction of glacial acetic acid (*q.v.*) with aniline (*q.v.*). It is a febrifuge or antipyretic, used in headaches and fevers, of which it reduces the pain without removing the cause. The dose is 0.1 to 0.3 grams (1½ to 5 grains). It is liable to cause aniline poisoning, a depressant action on the heart muscle, resulting in collapse, nausea, vomiting and a blueness of lips and nails. The last is caused by certain chemical changes in the blood, whereby red corpuscles lose their power to carry oxygen. Acetanilide is a white, crystalline substance melting at 115° C, boiling at 305° C and soluble in water, alcohol or ether. Its chemical formula is $C_6H_5NH.CO.CH_3$.

ACETATES: see ACETIC ACID.

ACETIC ACID, the organic acid which gives to vinegar (from which it derives its name) its characteristic sharp taste, is the second of the series of aliphatic acids, formic acid (*q.v.*) being the first. Its formula is $CH_3.CO_2H$, and it occurs in nature in plant juices occasionally as free acid, but more generally as calcium or potassium salts. Three processes are available for large-scale production of acetic acid, $CH_3.COOH$.

1. Fermentation Processes.—Several species of bacteria convert dilute alcoholic liquors into impure acetic acid, in the form ordinarily known as vinegar. This bacterial fermentation, which takes place in the presence of air and a certain amount of nutrient phosphates and nitrogenous material necessary for the feeding of the bacteria, involves the oxidation of ethyl alcohol (see ALCOHOL) into dilute acetic acid. A more concentrated acid is obtainable by neutralizing the dilute acid with lime to form calcium acetate and then distilling a mixture of this salt with strong sulphuric acid. In the oxidation of alcohol to acetic acid the living acetic bacteria may be replaced by specific enzymes (unorganized ferments) or even by spongy platinum or palladium since either of these, in the presence of air, oxidizes the alcohol first to acetaldehyde and then to acetic acid.

2. Destructive Distillation of Wood.—A considerable proportion of the acetic acid of commerce is obtained by the destructive distillation of wood, the hard woods yielding 4.70 to 6.5% of the concentrated acid.

3. Synthetic Acetic Acid.—The starting point in the industrial synthesis of acetic acid is calcium carbide made in the electric furnace from limestone and coal. The acetylene evolved from the carbide by addition of water is converted into acetaldehyde

by passing into hot dilute sulphuric acid containing mercuric sulphate. The acetaldehyde is further oxidized by air or oxygen in the presence of a catalyst consisting of the oxides of metals such as iron, vanadium and uranium, acetic acid being thereby formed.

Anhydrous acetic acid, usually termed glacial acetic acid owing to its ice-like crystallization at $16.7^{\circ}\text{C}.$, has a very pungent odour and boils at $118^{\circ}\text{C}.$ to a heavy inflammable vapour. Its alkali salts are soluble in water. Ferrous and ferric acetate are used as mordants in dyeing (*q.v.*). Normal lead acetate is known in commerce as sugar of lead and basic copper acetates are known as verdigris (*q.v.*).

Acetic acid and the acetates are detected by heating with ethyl alcohol and sulphuric acid; ethyl acetate is evolved and recognized by its fragrant odour. When heated with arsenious oxide, acetates give rise to the malodorous and highly poisonous cacodyl oxide.

Pharmacology and Therapeutics.—Glacial acetic acid is sometimes used as a caustic for corns. Vinegar (with 5% acetic acid) is taken as a cure for obesity, but this application is undesirable since continued use may so injure the mucous membrane of the stomach as to cause indigestion and a morbid reduction in weight. The soluble acetates, and especially potassium acetate, are useful medicinal agents for after absorption in the blood, they are oxidized to carbonates, thus acting as *remote* alkalis increasing the alkalinity of the blood or reducing the acidity of the urine without the disturbing influence of alkalis on the digestive tract.

ACETO-ACETIC ESTER, ethyl acetoacetate is an outstanding example of a chemical substance having a dual character arising from the possession of two different molecular structures. Such substances are called tautomeric compounds (*see ISOMERISM*). The substance is an ester (which *see*), and has the molecular formula $\text{C}_6\text{H}_{10}\text{O}_5$. The two tautomeric forms are represented by

and ordinary specimens of the ester as handled in commerce may be regarded as consisting of 93% of the former in equilibrium with 7% of the latter. When treated by reagents which combine with ketones, such as sodium bisulphite, hydroxylamine, phenylhydrazine and hydrocyanic acid, the ketonic character of the ester is manifested, and when acted upon by reagents such as phosphorus pentachloride, diazomethane, ammonia and amines, which detect alcoholic (enolic) groups, then its enolic nature is revealed.

In 1911 L. Knorr separated the two forms of the ester in a state of purity. The ketonic modification was frozen out of the equilibrium mixture at -78°C and the enolic modification was isolated in the liquid condition by decomposing the sodium derivative with hydrogen chloride at the same low temperature. In these experiments it was found to be essential to use silica vessels. The ester was first discovered by A. Geuther in 1863 and its ketonic nature was unravelled by E. Frankland and B. F. Duppa in 1865. The original method of production is still employed on a manufacturing scale. Sodium, either molten or in wire form, is added to dry ethyl acetate containing a little ethyl alcohol. When all the metal has dissolved the mixture is acidified with dilute acetic or sulphuric acid and the crude acetoacetic ester, which is partially miscible with water, separates as an oil on addition of common salt and is purified by distillation under diminished pressure. The ester is a colourless, fragrant liquid boiling, with slight decomposition, at 181°C under a pressure of 760 mm.

In the sodium condensation a little alcohol is needed to promote the solubility of the metal and this action of alcohol is indicated in the following equations:—

In the chemical laboratory acetoacetic ester is a valuable syn-

thetic reagent, for its sodium derivative when acted on by an alkyl iodide yields an alkylacetoacetic ester, and the sodium derivative of the latter ester by similar means furnishes a dialkylacetoacetic ester. These alkyl- and dialkyl-acetoacetic esters may be employed in producing either higher ketones or higher fatty acids (*see CHEMISTRY: Organic, Aliphatic*). The ester has also been employed in the synthesis of pyridines (*q.v.*), quinolines (*q.v.*), furfuranes (*q.v.*), pyrazoles (*q.v.*), pyrroles (*q.v.*), and compounds of the purine group (*q.v.*).

In addition to the foregoing scientific uses acetoacetic ester is utilized industrially in the manufacture of synthetic drugs and dyes. Of these drugs the best known is antipyrine (*q.v.*) which is prepared by methylating phenylmethylpyrazolone, the condensation product of acetoacetic ester and phenylhydrazine.

Several important dyes belong to the pyrazolone series. Eriochrome red (Chrome fast red B) is manufactured by successively condensing acetoacetic ester with phenylhydrazine and with diazotized 1-amino- β -naphthol-4-sulphonic acid. A series of yellow dyes and pigment colours is similarly produced by condensing the ester successively with various aromatic hydrazines and diazo-compounds (*see DYES, SYNTHETIC*).

ACETONE is present in very small quantities in normal urine, in the blood, and in larger quantities in diabetic patients, and is the simplest representative of the aliphatic ketones. It results with other ketones from the destructive distillation of wood and other cellulosic derivatives, and for this reason it is present in crude wood spirit (methyl alcohol). It has the formula $\text{CH}_3\cdot\text{CO}\cdot\text{CH}_3$ and is thus dimethyl ketone. Acetone is a colourless, fragrant, inflammable, mobile liquid, boiling at 56.3°C and miscible in all proportions with water, alcohol and ether. It has very useful solvent properties, dissolving considerable quantities of acetylene gas (*q.v.*). It dissolves many fats and resins and is a solvent for cellulose nitrate and acetate. On account of the latter properties, it finds extensive use in the manufacture of cordite, and of artificial silk.

On account of its valuable properties as a solvent and as an organic reagent, acetone is prepared on a large scale, the processes available being as follows:—

1. The dry distillation of calcium acetate leading to the formation of acetone and calcium carbonate.

2. The catalytic (*see CATALYSIS*) decomposition of glacial acetic acid into acetone, carbon dioxide, and water when it is passed over heated metallic oxides such as alumina and thoria.

3. The fermentation of maize, rice, horse chestnut meal or other starchy materials with a bacterium discovered by A. Fernbach, the starch present being converted into a mixture of normal butyl alcohol (2 parts) and acetone (1 part).

Acetone is employed in many organic syntheses. Dehydrating agents convert it successively into mesityl oxide and phorone, and on distillation with sulphuric acid it is transformed by elimination of water into mesitylene (1:3:5-trimethylbenzene). In conjunction with *ortho*nitrobenzaldehyde, it has been used to prepare artificial indigo.

Therapeutic Applications.—The ketones in general give rise to narcosis and lowering of blood pressure and acetone itself produces intoxication and sleep but is less powerful than ether or chloroform, although less toxic than ethyl alcohol. When treated with chlorine, bromine, or iodine in presence of alkali, acetone is converted respectively into chloroform, bromoform, or iodoform. It is the starting point in the production of the narcotic drug sulphonal.

ACETOPHENONE or Phenyl Methyl Ketone is the simplest representative of the mixed aliphatic-aromatic ketones. It crystallizes in colourless leaflets with a characteristic odour; it melts at 20°C and boils at 202°C , is volatile in steam and has the composition, $\text{C}_6\text{H}_5\cdot\text{CO}\cdot\text{CH}_3$. It occurs to a small extent in coal tar and, having feebly basic properties, is extracted from the heavy oil fractions (b.p. 160 – 190°) with sulphuric acid.

Acetophenone condenses with phenylhydrazine but does not combine with sodium hydrogen sulphite. It results from the distillation of a mixture of dry calcium acetate and benzoate but is best prepared by condensing benzene and acetyl chloride with

aluminium or ferric chloride in carbon disulphide. It has anaesthetic and soporific properties and under the name of hypnone has been used as a drug to induce sleep. With hydroxylamine it condenses to acetophenoneoxime, $C_6H_5 \cdot C(CH_3) : NOH$, which, under the influence of phosphorus pentachloride in ether is converted into the isomeric acetanilide, $C_6H_5NH \cdot CO \cdot CH_3$, this transformation being an example of the so-called Beckmann change which occurs with ketone oximes in general.

p-Aminoacetophenone also has anaesthetic properties, whereas the condensation product of acetophenone and phenetidine is an antipyretic substance. On adding sodium to acetophenone dissolved in ethyl acetate the sodium derivative of benzoylacetone is produced from which benzoylacetone, $C_6H_5CO \cdot CH_2CO \cdot CH_3$ is obtained by acidification, this condensation being a typical example of the Claisen reaction.

ACETYLENE is a colourless gaseous compound of 7.75% of hydrogen and 92.25% of carbon, used as a fuel, both in the oxy-acetylene process for the welding and cutting of metals, and also for isolated or independent lights. It is of great interest to the chemist, being the simplest of all the *unsaturated* organic compounds with the composition $CH:CH$ (see *CHEMISTRY: Organic*). If subjected to a pressure of 61.6 atmos. at the critical temperature of $36.5^\circ C$, it suddenly becomes a colourless transparent liquid. At lower temperatures it becomes liquid under less pressure, e.g., at $15^\circ C$ under slightly less than 38 atmos., and at $-82^\circ C$ under one atmos. On a slight further reduction of temperature, the liquid contracts considerably, passing to a crystalline solid.

The characteristic and unpleasant smell generally associated with acetylene is not due to this gas at all, but to traces of impurities in the calcium carbide from which it is made in all ordinary cases (see below).

The density of pure gaseous acetylene is 0.91 (air=1), whereas that of marsh gas (methane) is 0.55, and of town gas (coal-gas, usually with some water gas) between 0.40 and 0.55. Its higher density signifies that acetylene requires pipes and nozzles of larger bore to pass the same volume of gas without greater pressure, but this disadvantage is offset by the fact that a given heating or lighting effect is obtainable from a considerably smaller volume of acetylene than of either of the other gases named. One litre of dry acetylene at $0^\circ C$ and under 760mm. pressure weighs 1.1613 gram; one cu.ft. of acetylene, saturated with water vapour at $60^\circ F$ and 30in. pressure, weighs 0.0675lb. Its mean coefficient of expansion between 0° and $100^\circ C$ is 0.003738 (air = 0.003671).

The density of liquid acetylene is 0.613 at $-80^\circ C$, 0.451 at $0^\circ C$ and 0.397 at $30^\circ C$; the coefficient of expansion is thus exceptionally high—0.00224 for each degree. The figures also show that liquid acetylene is one of the lightest of liquids. It is of interest only from the scientific standpoint, because it behaves as an explosive when subjected to heat or when exposed to a spark, and its manufacture and sale are generally prohibited.

Water at $15^\circ C$ dissolves 1.15 times its volume of gaseous acetylene at atmospheric pressure; at $0^\circ C$, 1.73 times, and at $30^\circ C$, 0.84 times. Whereas this degree of solubility in water is considerably higher than that of other fuel gases, it is not such as to preclude the use of water as a confining liquid in acetylene-generating plant and gasholders. In special cases in which it is desirable to reduce the diffusion of acetylene through the seals of such plant, fresh water is replaced by a saturated solution of calcium chloride, which at $15^\circ C$ dissolves only 0.06 of its volume of acetylene, or by strong brine. A saturated solution of

common salt at $15^\circ C$ dissolves 0.21 of its volume of acetylene. These saline solutions freeze at considerably lower temperatures than fresh water, and consequently gasholders in which they are employed as the confining liquid may be used without protection from mild frosts. On the other hand, they shorten the life of the plant, their corrosive action on iron and other metals being greater than that of water. A water solution of glycerine is an alternative which is non-corrosive and does not affect metals.

Acetylene dissolves more freely in most organic liquids than in water. At ordinary temperature and pressure one volume of each of the following liquids dissolves the number of volumes of acetylene shown:

	Vols.		Vols.

CUTTING METAL WITH AN OXY-
ACETYLENE FLAME, ONE OF INDU-
STRY'S MANY USES OF ACETYLENE

"Dissolved Acetylene."—The relatively large solubility in acetone was first observed by G. Claude and A. Hess in 1897, who stated in the *Comptes Rendus* of that year that the solubility was also very nearly proportional to the pressure, being $12 \times 25 = 300$ vols. at a pressure of 12 atmos. They pointed out that the coefficient of expansion of the solution in acetone was very much lower than that of liquid acetylene, and moreover, the solution did not explode when a wire in it was raised to bright redness. Their observations led ultimately to the development of the present method of supplying acetylene in portable steel cylinders, in which it is safely stored under pressure as a solution in acetone. Acetone increases in volume by 4.4% for each atmosphere pressure at which it is saturated with acetylene. Consequently acetone in which acetylene is dissolved under an absolute pressure of 16 atmos. occupies $1 + (16 \times 0.044) = 1.684$ times its original volume. This pressure, viz., 15 atmos. above the normal, is that to which steel cylinders packed with porous substance and containing acetone, are permitted by law to be charged with acetylene in Great Britain. The cylinders must first have been tested and found to show no permanent stretch after being subjected for 15 minutes to four times the charging pressure. Similar regulations are enforced in other countries in regard to the supply of acetylene in steel cylinders. The cylinders are now usually seamless or solid-drawn. In the U.S., acetylene cylinders are constructed with welded or biased heads or tops.

Acetylene dissolved under pressure in acetone in steel cylinders is known commercially as "dissolved acetylene." Its production has become a considerable industry in most countries, on account of the convenience to users of a portable supply of acetylene, with relief from the provision and supervision of generating and purifying plant. Since the volume of acetone varies with the amount of acetylene dissolved in it, it is obvious that the cylinders in use must be only partially filled with the liquid, the remaining space being occupied by compressed gaseous acetylene. Such compressed free acetylene would be liable to explode if the cylinder were exposed to great heat or shock, but this risk is avoided by first filling the cylinder with inert porous material, the interstices in which will be sufficiently small to prevent any explosion which may happen to be initiated at some point therein extending beyond that point. The porous material in this respect acts similarly to the fine wire gauze of a miner's safety lamp, which prevents the flame within the lamp igniting explosive gas outside it. Various porous materials have been used for this purpose, e.g., dried clay, porous brick, infusorial earth, Kieselguhr and charcoal, singly or in admixture with or without a binder. In Great Britain the porous material preferred is the vegetable fibre, kapok, the resilient properties of which cause it to be evenly distributed, and free from open spaces of such a size that, should an explosion occur, it would assume dangerous magnitude. Kapok has the dual advantage of providing spaces between its fibres, and of having natural capillaries within the latter.

Current practice in Great Britain is to pack the cylinder uniformly with kapok until the solid matter of the latter occupies one-fifth of the capacity of the cylinder, thus leaving four-fifths

as interstices in the kapok packing. Then acetone is run in to fill a further two-fifths; leaving two-fifths of the internal volume of the cylinder for expansion of the acetone on charging with acetylene, and any subsequent exposure to heat. Cylinders of dissolved acetylene thus prepared are convenient and safe.

Uses.—Acetylene requires 2.5 times its volume of oxygen to effect its complete combustion; consequently all the oxygen present in 11.95 times its volume of air is used up when acetylene is burned in open jets. Such jets are employed as lights in portable lamps, buoys, road signals, isolated premises, etc., but the consumption of acetylene for lighting is small compared with its use in the industrial welding and cutting of metals, for which purposes it is consumed in a blow-pipe to which a supply of undiluted oxygen is given from a steel cylinder containing that gas under pressure. Acetylene is an "endothermic" compound, which means that heat has been absorbed in its formation; and this heat is given out again, in addition to the heat of combustion of its constituent carbon and hydrogen, when acetylene is burned. On this account, acetylene affords a higher flame temperature than other fuel gases. Its calorific value lies, according to different observers, between 11.8 and 12.2 cal. per grm. Taking Berthelot and Matignon's figure of 12.13, the calorific value of one litre of acetylene at 0° C and 760mm., dry, is 14.086 calories, and that of one cu.ft. at 60° F, 30in., and saturated, is 1,474 B.Th.U. (British standard conditions). For comparison with the latter figure, it should be mentioned that town gas in Great Britain averages about 500 B.Th.U., and natural gas in U.S.A. nearly 1,000 B.Th.U.

Disadvantages.—Acetylene in itself has very slight toxic properties, but certain of the impurities, such as phosphine, which occur in it before purification, are highly toxic. Nevertheless, even crude acetylene may be inhaled with less risk than ordinary town gas.

A mixture of acetylene with air will explode from a light or spark, according to F. Clowes, unless the acetylene forms less than 3% or more than 82% of the mixture. Other observers give a more limited range to the explosive mixture, but it is certainly very much wider in similar conditions than for coal gas or natural gas, and greater care should be exercised to avoid both escapes of acetylene and naked lights in the proximity of leaks. It must be emphasized, however, that acetylene at ordinary pressures cannot be made to explode in the absence of air, oxygen or chlorine, and in this respect it is similar to coal gas and other fuel gases. When, however, it is compressed to more than 2 atmos., a spark or red-hot wire will effect its dissociation, which will spread through the whole, and the heat liberated by reason of its endothermic character will give rise to all the effects of an explosion. On this account in most countries acetylene may not be compressed to more than 2 atmos., unless it is within a porous material, as described above.

Carbides.—Acetylene was discovered by E. Davy in 1836, when he decomposed with water a black mass, produced by strongly heating a mixture of calcined tartar and charcoal. The mass contained potassium carbide. Other metallic carbides were produced between that year and 1891-92, when calcium carbide was made in an electric furnace almost simultaneously by H. Moissan on a very small scale in Paris, and by T. L. Willson, a Canadian electrical engineer, at an aluminium works at Spray, near Leaksville, North Carolina. Before the close of the year 1895, the commercial production of calcium carbide had been started at Niagara, at Froges (France) and at Foyers (Scotland). Its manufacture is now conducted on a large scale in most countries where water-power is obtainable at low cost, notably in Norway and Sweden, Shawinigan (Quebec) and Niagara. The world's output varies from year to year and cannot be estimated closely, but it may be mentioned that the imports of calcium carbide into Great Britain in the years 1924, 1925 and 1927 have averaged about 40,000 tons per annum. The United States and France ordinarily consume larger quantities than Great Britain. Other carbides which yield acetylene when brought in contact with water are those of potassium, sodium, lithium, barium and strontium, but calcium carbide is the most economical to produce and use. (See also CARBIDES.)

Calcium carbide is a compound of calcium and carbon, having the formula CaC_2 , and therefore containing, in its pure state, 37.47% of carbon. It interacts with water immediately it is brought in contact with it, yielding 40-62% of its weight of acetylene (dry), and slaked lime. This yield of acetylene is equivalent to:

5.600 cu.ft. at 0° C, 760mm., and dry, per lb. of pure CaC_2 .
or 6.16 cu.ft. at 60° F, 30in., and saturated, per lb. of pure CaC_2 .
or 349.7 litres at 0° C, 760mm., and dry, per kg. of pure CaC_2 .
or 375.6 litres at 15° C, 760mm., and saturated per kg. of CaC_2 .

Commercial calcium carbide contains upwards of 20% of inert material, and is ordinarily guaranteed to give a standard yield of 4.80 cu.ft., at 60° F, 30in., and saturated, per lb., or the equivalent figure of 300 litres, at 15° C, 760mm. and saturated, per kg. This standard represents fairly closely the average yield obtainable from commercial carbide in 1925-27, though occasionally the inert material in the carbide falls as low as 10%, and on the other hand sometimes reaches as much as 30%. Pure calcium carbide has a specific gravity of 2.22, and resembles fine-grained granite or hard limestone in appearance and hardness. The commercial product is broken and screened to lumps of convenient size for different uses, and is packed for transport in air-tight steel drums of 50 and 100kg. capacity. Since it evolves acetylene slowly when exposed to damp air, and rapidly when wetted, calcium carbide is everywhere subject to special regulations for transport by sea and land, and for storage.

Calcium carbide is manufactured by heating together in the electric furnace a mixture of lime and anthracite containing about 40% of the latter. Both materials must be as free as possible from impurities, and especially from compounds of phosphorus, sulphur or silicon, which render the resultant carbide liable to produce acetylene containing phosphine, hydrogen sulphide and silicon hydride. Carbide is sold generally under a guarantee that the gas it yields shall not contain more than 0.05% by volume of phosphine, or 0.15% of hydrogen sulphide. These impurities are inimical to the satisfactory use of the acetylene for either lighting or welding, and it is necessary to pass the gas before it is used through a vessel containing a purifying agent which will abstract them. Purifying agents which will abstract phosphine completely and economically, without acting upon the acetylene, have been sought in many directions, but only three classes of materials have found practical application. The principal active constituents of these materials are:—(1) chlorine liberated from a hypochlorite as used in "Acagin," "Puratylene" and "Klinger's Material"; (2) oxygen derived from an acid solution of chromic acid absorbed by infusorial earth, as in "Heratol," or from an ill-defined iron-silicic-acid compound, as in "Carburylene"; and (3) copper, as an acid solution of cuprous chloride absorbed in infusorial earth, as in "Frankolin." All these materials, when properly prepared, may be regarded as effective in that 1lb. will abstract the impurities from 80 to 200 cu.ft. of acetylene produced from carbide of the normal degree of purity. It is obvious, however, that the purifying material will be exhausted less quickly the smaller are the proportions of phosphine and hydrogen sulphide in the crude gas, and consequently there is an initial advantage in calcium carbide which is relatively free from phosphorus and sulphur compounds.

Acetylene is obtained from calcium carbide by bringing the latter in contact with water, and innumerable forms of "generators" have been devised with the object of effecting and controlling the reaction between the carbide and the water in such a manner that the acetylene shall be liberated at the desired rate. The reaction, represented by the formula $\text{CaC}_2 + 2\text{H}_2\text{O} = \text{C}_2\text{H}_2 + \text{Ca(OH)}_2$, is one in which heat is set free. Thus, 1lb. of pure calcium carbide decomposed with excess of water liberates about 4,380 B.Th.U. (or one kg. liberates 2,433kg.-calories). These figures become more significant if it is borne in mind that 4,380 B.Th.U. represents the heat imparted to 2.92gals. of water in raising it from 62° F to its boiling point. Except on the very small scale of a bicycle lamp, therefore, no acetylene generator can depend on atmospheric cooling for the dissipation of the liberated heat. Generators must, in practice, be so designed that

the heat liberated therein shall be imparted to water, which shall be available in sufficient volume not to be raised to the boiling point. The water may be so disposed or circulated that it gives up its heat rapidly to the atmosphere.

In small generators, water commonly drips on to the carbide, at a rate controlled by a hand-operated valve and, or by the restriction of the free egress of the evolved gas. In large generators, however, the carbide either is dropped into a large excess of water, or is intermittently submerged by a local excess of water. Provision should be made for the sludge of slaked lime, which is the residue of the decomposition of carbide, to settle down out of close contact with carbide which has not already been decomposed. The sludge is, in most instances, withdrawn or run off at intervals in a semi-fluid condition. The rapid decomposition of a large charge of carbide may raise particles of metal inside the generator to a temperature above that at which acetylene ignites in air, and it is important that generators, liable to be recharged at short intervals, should be so constructed that air cannot enter the heated interior during discharging and recharging.

The harmfulness of overheating in generators, through inadequate cooling, lies in the fact that acetylene is a compound which is transformed, when heated to temperatures not much above that of boiling water, into polymerides or other hydrocarbon compounds, such as benzene, which have the same or nearly the same percentage composition, but are not gaseous at ordinary temperatures, or have not the same value as illuminating or heating gases. The fact that acetylene is prone to polymerization (*q.v.*), and to enter into combination, at comparatively low temperatures, makes it a very valuable medium for the manufacture of a number of organic chemicals such as acetaldehyde (*q.v.*), acetic acid (*q.v.*) and acetone (*q.v.*).

Lighting.—Acetylene for lighting purposes is burned, under a pressure of about 4 in. water-seal, in steatite jets so designed that the issuing gas draws sufficient air into the flame to effect the combustion of the gas without smoke being produced. The acetylene flame thus formed is the most highly self-luminous of all ordinary gas flames, and its spectral character is such that colours are seen by it as in daylight. Burners in general use consume either 0.5 or 0.7 cu.ft. of acetylene per hour, and give a light equivalent to between 40 and 50 candles per cubic foot consumed. Acetylene may also be used to raise mantles to incandescence, and its illuminating effect is thereby raised to about 100 candles per cubic foot. Mantle burners are best fitted for use in conjunction with "dissolved acetylene," which gives an adequate constant pressure for their proper action.

Special forms of blow-pipes are used to produce the oxy-acetylene flame for the welding and cutting of steel and other metals, for which purposes acetylene finds its principal outlet.

ACETYLENE, IN MEDICINE. Acetylene, which when pure loses its usual offensive smell, is an anaesthetic when inhaled and was first used as such in 1924. Like ethylene (*q.v.*) it is in the experimental stage at present. Its efficiency is between that of gas-oxygen and ether. It has the advantage that far greater amounts of oxygen can be given with it, up to about 50%, than with ethylene or nitrous oxide. (*See ANAESTHETICS.*) (W. S. S.)

ACHAEA. (1) A district on the north coast of the Peloponnese, between the mountains of Erymanthus and Cyllene and the Corinthian Gulf; bounded on the west by Elis, east by Sicyon, sometimes included in Achaea. The 12 cities in its narrow fertile coastland formed a religious confederacy, meeting in Poseidon's sanctuary at Helicé: from this developed the political ACHAEAN LEAGUE (*q.v.*) of Hellenistic times.

(2) Achaea Phthiotis is a district south of Thessaly and west of the Gulf of Pagasae (Volo). For the origin of the name, and relations between north and south Achaea, *see* ACHAEANS.

(3) "Achaea" was the name given by the Romans to the province formed in 140 B.C. for the mainland of Greece south of

Thessaly, Epirus and Acarnania, which were included in "Macedonia." Its administrative capital was Corinth.

(4) Achaea in the middle ages was a principality, formed within the same region after the Latin conquest of the Eastern empire (A.D. 1204): the first prince being William de Champlitte (d. 1209). It survived, with various dismemberments, until 1430, when the last prince, Centurione Zaccaria, ceded the remnant to his son-in-law, Theodorus II., despot of Mistra. In 1460 it was conquered, with the rest of the Morea, by the Turks.

(5) Achaea in modern Greece is the Peloponnesian district (1), mainly engaged in currant growing, the crop being shipped from Patras and Aegion (Vostitza).

ACHAEAN LEAGUE, a confederation of the towns of Achaea in ancient Greece. Isolated on their narrow strips of plain, these towns were exposed to the raids of pirates from the north of the Corinthian gulf. As a protection against such dangers the earliest league of 12 Achaean cities arose. In the 4th century, we find it fighting in the Theban wars (368–362 B.C.), against Philip (338) and Antipater (330). Antigonos Gonatas dissolved the league; but by 280 B.C. four towns combined again, and before long the ten surviving cities of Achaea had renewed their federation. Much was due to the statesmanship of Aratus (*q.v.*), who initiated an expansive policy; in 228 it included Arcadia, Argolis, Corinth and Aegina.

Aratus probably also organized the new federal constitution. The league embraced city-States which maintained their internal independence and powers of self-government. Only in foreign politics and war was their competence restricted.

The central government was democratic. The legislative powers resided in a popular assembly, meeting at Aegium, in which every member of the league over 30 years of age could speak; each city counted one on a division. Extraordinary assemblies could be convoked in special emergencies. A council of 120 delegates served as a committee for preparing the assembly's programme. The chief magistracy was the *strategia* which combined with an unrestricted command in the field a large measure of civil authority and had practically the sole power of introducing measures before the assembly. The ten *demiurgoi*, who presided over this body, formed a kind of cabinet. Philopoemen (*q.v.*) transferred the seat of assembly from town to town by rotation, and placed dependent communities on an equal footing with their former suzerains.

The league prescribed uniform standards and coinage; it summoned contingents, imposed taxes and fined or coerced refractory members.

The first federal wars were against Macedonia, against Antigonos Gonatas and Aetolia and, with Aetolia, against Demetrius. A greater danger arose (227–223) from the attacks of Cleomenes III. (*q.v.*). Owing to Aratus's irresolute generalship the indolence of the burghers and the inadequacy of its troops, the league lost much of its territory. The assembly negotiated with Antigonos Doson, who recovered the lost districts but retained Corinth for himself (223–221). When Philip V. came to the rescue against the Aetolians he annexed much of the Peloponnese. Under Philopoemen the league, with a reorganized army, routed the Aetolians (210) and Spartans (207, 201). After their neutrality during the Macedonian War the Roman general, T. Quintius Flamininus, restored their lost possessions, bringing the Peloponnese under Achaean control. In 150 B.C. the league, in defiance of Rome, attacked Sparta. The federal troops were routed near Corinth by L. Mummius Achaicus (146). The Romans now dissolved the league, and took measures to isolate the communities. Augustus instituted an Achaean synod comprising the dependent cities of Peloponnese and central Greece.

The chief defect of the Achaean league lay in its lack of provision for securing efficient armies and regular payment of imposts, and for dealing with disaffected members. It is the glory of the league, however, to have combined city autonomy with an organized central administration, and in this way to have postponed the entire destruction of Greek liberty for over a century. (*See* *ROME: History.*)

Greek History; L. Whibley, *A Companion to Greek Studies* (1916). The chief classical authorities are Polybius (esp. ii., iv., v., xxiii. and xxviii.), who is followed by Livy (xxxii., xxxv., xxxviii., etc.); Pausanias vii. 9. 24.

ACHAEANS. The name Achaeans is used in the Homeric poems in much the same sense as that in which the name Hellenes came to be used in later times. To Homer the Hellenes were a small tribe in Southern Thessaly (*Il.* ii. 684), but from the 8th century onwards the name became a general designation for all Greek-speaking peoples. Whether the name Achaeans was quite so general in its application is still a matter of doubt, but for practical purposes we may regard it as parallel. According to the traditional genealogies Achaeus was the son of Xuthus, son of Hellen.

The name has been connected with that of the Germanic tribe, Ingaevones, a connection that is possible but, perhaps, not very convincing. No light is thrown by it upon the meaning of the name. The Achaeans were a Greek-speaking people, but whether their dialect was Aeolic, Ionic or of the Arcadian type is a question that cannot yet be decided. The Homeric poems are in an artificial literary dialect.

The exact relationship between the Achaeans and Mycenaean culture is still a matter of doubt. The view held by Sir William Ridgeway was that the Achaeans were invaders from the north, a people of northern characteristics, of the fair-haired, grey-eyed type, bringing to Greece a civilization of Danubian origin distinguished by the use of iron, similar to the Hallstatt and Villanova cultures. The former inhabitants were, in his view, of a short, dark Mediterranean type, but Greek-speaking. It was the Achaeans who, according to this view, brought the *labialising* dialects to Greece.

The view more generally held, however, has been that the Mycenaean peoples were not Greek-speaking. The question depends to some extent upon another: What was the language spoken by the Minoan peoples of Crete, of whose culture the Mycenaean was an offshoot? There is no real evidence that the Minoans spoke Greek, or even an Indo-European language at all, and indeed there are many considerations that point to the conclusion that they did not.

A third and more recent view is that the Greek-speaking peoples came to Greece in three separate waves, Ionian, Achaean and Dorian, the first invasion occurring about the 17th century B.C. The Mycenaean civilization was an Achaean civilization, Greek-speaking, and differing in certain notable respects, for example, in dress, from the Minoan. The Greek invaders subdued a previous non-Greek population and first destroyed the Minoan civilization, afterwards reconstituting it, mingled with northern elements, their advent having much the same effect as the barbarian conquest of the Roman empire.

The facts hitherto known are these. There had existed an early population of Greece having a close connection with Anatolia. A large number of place names occur throughout the Greek mainland as well as in Macedonia, Epirus and Thrace which are paralleled in Asia Minor, notably those in *-υθος* and *=σσος*. These are generally regarded as being non-Indo-European and therefore non-Greek. The Greeks were aware of the existence of earlier inhabitants of their country and the Aegean islands, whom they called by the general name of Pelasgians (*q.v.*), distinguishing, however, Leleges and Carians, the latter of whom inhabited the south-western corner of Asia Minor in historical times.

Again, it is probable, if not certain, that the whole Peloponnese, and possibly parts of Central Greece, were inhabited by Ionians previous to their conquest by Achaeans. The traditional home of the Ionians was in the north-eastern Peloponnese, whence they were driven to Attica and the Cyclades by an Achaean invasion. The fact that the name Ionian was applied to the sea west of Greece, on whose shores no Ionians lived in historical times, nor could have done so for many centuries previously, shows that the whole Peloponnese at least must once have been regarded as Ionian. The Achaeans emerge into history in the middle of the 14th century B.C. In the year 1922 a reference to

them (Akhkhiyawa) in one of the Hittite texts of that date was read by Dr. Forrer. They were at that time an important naval power situated in the western regions of Asia Minor and the island of Lesbos, and were under the leadership of a prince named Attarsiyas. They appear to have been also in Cyprus and Pamphylia. Later, as has been already mentioned, in the Homeric age the Achaeans were lords of the Peloponnese and as far north as Thessaly, and their name, so far as can be gathered, was employed as a general designation for all Greeks.

The physical characteristics of the Achaeans are difficult to determine, and not a very safe guide. Three passages in the *Odyssey* refer to tallness of stature as a mark of beauty, and it was, perhaps, therefore rare. Heroes are sometimes referred to both by Homer and Hesiod as fair-haired (*ξανθός*) (though the epithet may mean nothing more than not having *black* hair) and we know that both in classical and Roman times blue or grey eyes were rare in Greece.

In classical times the name Achaeans was confined to the people inhabiting the strip of land along the north coast of the Peloponnese, between the Corinthian gulf and the northern Arcadian mountains. They were for the most part subject to Dorian overlords, and their dialect was Doric. After the days of the Macedonian supremacy the Achaean League became one of the most powerful influences in Greece, and it was this fact that led the Romans, when they made the country into a province, to give it the name of Achaea. (See DORIANS; IONIANS; GREECE, *History*.)

ACHAEMENES (HAKHAMANI), the eponymous ancestor of the royal house of Persia, the Achaemenidae. According to Darius in the Behistun inscription and Herod. iii. 75, vii. 11, he was the father of Teispes, the great-grandfather of Cyrus. Whether he really was an historical personage, or merely the mythical ancestor of the family, cannot be decided. According to Aelian (*Hist. anim.* xii. 21), he was bred by an eagle. We learn from Cyrus's proclamation that Teispes and his successors had become kings of Anshan; *i.e.*, a part of Elam (Susiana), where they ruled as vassals of the Median kings, until Cyrus the Great in 550 B.C. founded the Persian empire. After the death of Cambyses, the younger line of the Achaemenidae came to the throne with Darius, whose father Hystaspes was, like Cyrus, the great-grandson of Teispes. Cyrus, Darius and all the later kings of Persia call themselves Achaemenides (*Hakhāmanishiya*). With Darius III. *Codomanus* the dynasty became extinct and the Persian empire came to an end (330 B.C.). The adjective *Achaemenius* is used by the Latin poets as the equivalent of "Persian" (Horace, *Odes*, ii. 12, 21). See PERSIA. The name Achaemenes is borne by a son of Darius I., brother of Xerxes. After the first rebellion of Egypt, he became satrap of Egypt (484 B.C., Herod. vii. 7). He commanded the Persian fleet at Salamis, and was (460 B.C.) defeated and slain by Inarus (Herod. iii. 12), the leader of the second rebellion of Egypt (see also Diodorus xi. 71).

ACHAEMENIDAE, the Graecized name of the family of the ancient Persian kings. (See PERSIA: *Ancient History*.)

ACHARD, FRANZ CARL (1753–1821), Prussian chemist, was born at Berlin on April 28, 1753, and died at Kunern, in Silesia, on April 20, 1821. He was a pioneer in turning to practical account A. S. Marggraf's discovery of the presence of sugar in beetroot, and by the end of the 18th century he was producing considerable quantities of beet-sugar, though by a very imperfect process, at Kunern, on an estate which was granted him, about 1800, by the king of Prussia. There, too, he carried on a school of instruction in sugar-manufacture. He published several volumes of chemical and physical researches and discovered, among other things, a method of working platinum.

ACHARIUS, ERIK (1757–1819), Swedish botanist, was a pupil of Linnaeus at Uppsala University, and devoted himself to the study of lichens. His most important work is *Lichenographia Universalis* (Göttingen, 1804).

ACHATES, the companion of Aeneas in Virgil's *Aeneid*. The expression "fidus Achates" has become proverbial for a loyal and devoted companion.

ACHELOUS (mod. *Aspropotamo*, "white river"), the largest river in Greece (130m.). It rises in Mt. Pindus, and, dividing Aetolia from Acarnania, falls into the Ionian Sea. Its water is charged with fine mud, which is deposited along its banks in fertile, marshy plains. At its mouth, a number of small islands (Echinades) have been enveloped in this deposit. It was formerly called Thoas, from its impetuosity, and its upper portion Inachus, the name Achelous being restricted to the shorter eastern branch. The name is given to several other rivers in Greece, and appears in cult and in mythology as that of the typical river-god.

ACHENBACH, ANDREAS (1815–1910), German landscape painter, was born at Cassel on Sept. 29, 1815, and died on March 31, 1910. He was a pioneer of the German realistic school. He studied at Düsseldorf under Schirmer, but emancipated himself from the contemporary school of landscapists which delighted in the representation of romantic scenery. He was the first artist of the Düsseldorf school who painted nature for its own sake. As a young man he sought inspiration in Holland and Norway. His pictures of the stormy North sea, of Dutch canal scenes and of Rhineland villages contrasted favourably with the sentimental landscapes of his contemporaries. His works are to be found at the Berlin National Gallery, the New Pinakothek in Munich, and the galleries at Dresden, Darmstadt, Cologne, Düsseldorf, Leipzig and Hamburg.

His brother, **OSWALD ACHENBACH** (1827–1905), is distinguished for his colourful renderings of the Bay of Naples, of Rome and of Venice. He broke away from the traditional classicist interpretation of these scenes and revelled in strong and glowing colour effects. His works are exhibited at most of the important German galleries of modern art.

ACHERNAR, α Eridani, the brightest star in the constellation Eridanus (*q.v.*).

ACHERON (Gr. river of "woe"), name of several rivers of Greece. In Greek mythology the name is specially given to a river of Hades, over which departed souls were ferried by Charon. Later Greek and Roman poets used it to designate the lower world generally.

ACHESON, EDWARD GOODRICH (1856–), American inventor, was born at Washington (Pa.), on March 9, 1856. He was compelled to earn his living at an early age, but devoted his leisure to mechanical invention and experiment. Becoming interested in electricity, he entered the employ of Thomas A. Edison. In 1881 he assisted in the preparation of the Edison exhibit at the Paris International Exposition and later, for the Edison interests, installed the first electric lights in Italy, Belgium and Holland. On returning to the United States he resumed his experiments. He discovered a new abrasive substance of great cutting power, which he named carborundum. Inventing a method of producing a remarkably pure synthetic graphite, he organized in 1899 the Acheson Graphite Co., to handle the patent. This company met with great success. His numerous patents cover methods of producing metallic silicon cheaply; the lubricants known as oiltag, aquadag and gredag; the treatment of clay to increase plasticity (Egyptianized clay).

ACHIACHARUS, the name of an eastern sage whose "sayings" spread far and wide and had a remarkable influence on the world's gnomic literature. His history and moralizing sayings have been preserved, in whole or in part and with interesting minor variations, in Syriac, Arabic, Ethiopic, Armenian and Slavonic translations, and fragments of his teaching have survived among the Jewish papyri from Elephantine (*see later*). Rumanian and old Turkish versions are also in existence.

In the story of his life he is represented as the chief adviser of the Assyrian king Sennacherib. He adopted a nephew, Nadan by name, to succeed him. Profligate and wearied by Achiacharus'

unending inculcation of wisdom in proverbial form, Nadan brought about his uncle's downfall. But saved from death by his executioners, Achiacharus survived in an underground dungeon and resumed his former position at court when the king was in dire need of his services as an envoy and magician who could satisfy the demands of the king of Egypt. Thus he built a castle in the air and twisted ropes out of sand. On his return to Assyria he took vengeance on his nephew, flogged him, condemned him to his former dungeon-dwelling, constantly visited him to taunt him and give him instruction in which, as in Aesop's fables, animals and birds give expression to shrewd moral and ethical ideals. Nadan avoided execution by swelling out suddenly and bursting asunder, thus anticipating and possibly inspiring one of the New Testament descriptions of the end of Judas.

The date of composition and the original home of this work are matters of dispute. The Elephantine Papyri provide evidence that it was in existence by the fifth century B.C. The mention of Sennacherib may well point to Mesopotamia as its original home. But the story and the sententious sayings contained in it are probably far older than the Assyrian Empire. Sennacherib's name was probably inserted in the story when it had already assumed a fixed form in most other respects and had already embarked on its career of permeating the literature and thought of Palestine, Egypt and the Mediterranean coastlands.

ACHILL, the largest island off Ireland, separated from the Curraun peninsula of the west coast by the narrow Achill sound. Pop. (1921) 5,260. It is included in Mayo. Its shape is triangular, and is 15m. from east to west and 12m. from north to south. Area 57sq.m. The island is mountainous, the highest points being Slieve Croaghnaun (2,192ft.) in the west, and Slievemore (2,204ft.) in the north; the extreme western point is the bold and rugged promontory of Achill head, and the north-western and south-western coasts consist of cliffs reaching 800ft. in Minaun, near Keel on the south. The seaward slope of Croaghnaun is abrupt and the scenery beautiful. Desolate bogs alternate with the mountains; and the inhabitants earn a scanty subsistence by fishing and tillage, or go to England and Scotland during the harvesting. The Congested Districts Board has made efforts to improve the condition of the people, and a branch of the Great Southern railway to Achill sound, together with a swivel bridge across the sound, improved communications. In Dugort is a Protestant colony, known as "the Settlement," founded in 1834. There are megalithic remains at Slievemore and elsewhere.

ACHILLES, son of Peleus (*q.v.*) and Thetis; bravest, hand-somest and swiftest of the army of Agamemnon. According to Homer, he was brought up by his mother at Phthia with his cousin and his intimate friend Patroclus; his teachers were Phoenix and Cheiron. The non-Homeric tales of his childhood contain obvious folk-tale themes. Thetis had seven children, all of whom she put into the fire or a cauldron (*see DEMETER; HERCULES*), to make them immortal. All died save Achilles; because Peleus interfered at this point, Thetis left him. (Fairy Bride theme.) Or, Thetis dipped the child in the waters of the river Styx, by which (like Sigurd Fafnirs-bane) he became invulnerable, except that part of his heel by which she held him; whence the proverbial "heel of Achilles."

During the first nine years of the war as described in the *Iliad*, Achilles ravaged the country round Troy, and took 12 cities. In the tenth year occurred the quarrel with Agamemnon. In order to appease the wrath of Apollo, who had visited the camp with a pestilence, Agamemnon had restored Chryseis, his prize of war, to her father, a priest of the god, but as a compensation deprived Achilles, who had openly demanded this restoration, of his favourite slave Briseis.

Achilles refused further service, and rejected offers of compensation for the insult. During his absence the Greeks were hard pressed, and at last he allowed Patroclus to personate him, lending him his chariot and armour. When Hector slew Patroclus Achilles

was reconciled to Agamemnon, got new armour from Hephaestus, slew Hector, and, after dragging his body around the walls of Troy, restored it to Priam at his earnest entreaty.

The *Iliad* concludes with the funeral rites of Hector. It makes no mention of the death of Achilles, but hints at its taking place "before the Scaean gates." The *Odyssey* mentions his funeral. The *Aethiopis* took up the story of the *Iliad*. It told how Achilles, having slain the Amazon Penthesileia and Memnon (*q.v.*), was himself slain by Paris, whose arrow was guided by Apollo to his vulnerable heel. He was worshipped in many places: at Leuke, where he was honoured with offerings and games; in Sparta, Elis, and especially Sigeum on the Hellespont, where his famous tumulus was erected.

Behind these legends there probably lies a real man, certainly not a sun-, river- or other god. No certain statue of him, but numerous other representations in art, survive (see GREEK ART).

BIBLIOGRAPHY.—See Preller-Robert, *Gr. Mythologie*, II. iii., 2; Pauly-Wissowa, *Realencyklopädie*; Daremberg and Saglio's *Dictionnaire des Antiquités*; Roscher's *Lexikon*, s.v.; L. R. Farnell, *Hero-cults*, p. 285 et seq.

ACHILLES, TENDON OF. The large tendon inserted into the heel bone (calcaneus), at the back of the ankle, by means of which the calf muscles of the leg extend and invert the foot. These muscles sometimes become shortened, owing to overdevelopment, or sometimes to the continued use of high-heeled shoes, or they may be congenitally short. This defect sometimes leads to fallen arches and to pain in the foot so severe that lengthening the tendon by surgical means becomes necessary. This important tendon is named after Achilles, the great hero of the Trojan war and the central figure of Homer's *Iliad*. According to Greek legend, when Achilles was born, his mother dipped him in the river Styx. This bath made all parts of his body invulnerable except the heel by which she had held him, and it was in this heel that he later received a mortal wound.

ACHILLES TATIUS, of Alexandria, Greek rhetorician, author of the erotic romance, the *Adventures of Leucippe and Cleitophon*, flourished about A.D. 450, perhaps later. Suidas, who alone calls him Statius, says that he became a Christian and eventually a bishop (like Heliodorus, whom he imitated) but there is no evidence of this. Photius, while severely criticizing his lapses into indecency, highly praises the conciseness and clearness of his style, which, however, is artificial and laboured.

The large number of existing mss. attests the popularity of the romance. (*Editio princeps*, 1601; first important critical edition by Jacobs, 1821; later editions by Hirschig, 1856; Hercher, 1858. There are translations in many languages; in English by Anthony H[odges], 1638, and R. Smith, 1855. See also ROMANCE.)

Suidas also ascribes to this author an *Etymology*, a *Miscellaneous History of Famous Men*, and a treatise *On the Sphere*. Part of the last is extant under the title of *An Introduction to the Phaenomena of Aratus*. But if the writer is the *prudētissimus Achilles*, referred to by Firmicus Maternus (about 336) in his *Matheseos libri*, iv. 10, 17 (ed. Kroll), he must have lived long before the author of *Leucippe*. The fragment was first published in 1567, then in the *Uranologion* of Petavius, with a Latin translation, 1630.

ACHILLINI, ALESSANDRO (1463–1512), Italian philosopher and anatomist, was born at Bologna, Oct. 29, 1463, and died there Aug. 2, 1512. A much admired lecturer at Bologna and Padua, he was called the "second Aristotle."

BIBLIOGRAPHY.—His works were printed at Venice (1508, 1545, 1551 and 1568).

ACHIMENES, a genus of plants (family Gesneraceae, to which belong also Gloxinia and Streptocarpus), natives of tropical America, and well known in cultivation as stove or warm greenhouse plants. They are herbaceous perennials, generally with hairy serrated leaves and handsome flowers. The corolla is tubular with a spreading limb, and varies widely in colour, being white, yellow, orange, crimson, scarlet, blue or purple.

ACHIN (Dutch, Atjeh), and dependencies, is a Dutch Government in Sumatra, Dutch East Indies. It forms the northern extremity of the island, the boundary extending from Salahadj, a point on the east coast, just north of Aru bay, to a point on the west coast, about mid-way between Singkel and Barus, has an area of 20,544sq.m., and is divided into three assistant-resi-

dencies. It is very mountainous, with long ranges, running parallel with the axis of the island, and, particularly, in the east and extreme north-west, spurs projecting towards the coast. Most of the interior is mountainous, but, except in the extreme north, there is a fairly wide coastal plain, narrower in the east than in the west. The highest peaks are Bandahara (10,100) and Peperkison (9,000), on the southern central boundary, and Peuet Sagu (9,270), and Boer Ni Telong (8,500), in the north. In the north the coast is very varied, the cliffs, crowned with dense vegetation, rising precipitously from the sea in places, whilst in other parts there are sandy beaches or cultivated and well-populated plains. Elsewhere the coast is flat, and, in places, marshy. The rivers are short, and run down sharply to the coast. The largest, the Singkel, on the west coast, is almost useless for shipping, owing to the bar at its mouth, but further up stream it forms a good means of communication, in spite of its rapids. The ports of Achin are Oleh-leh and Sigli on the north, Edi on the east, and Meulaboh on the west. Oleh-leh is the gate-way to Kota Raja, the capital of Achin. Kota Raja is situated on the Achin river, some three miles up from the sea. The capital of Achin, when this was the wealthiest and most powerful sultanate in Northern Sumatra, having suzerainty over territory in the Malay Peninsula, Kota Raja still possesses remains of its former glory, but it consists largely of wooden and attap-roofed houses, built in *kampongs*, with the old Achinese Citadel (now garrison-quarters), a large Mosque, the modern residences of the governor and civil staff, offices of the administration, European business premises, together with two small hotels. Three bridges span the river. Kota Raja has a cable station, is connected by telegraph with Medan, and thence across the island with Padang and the south generally. A steam tramway links it up with Oleh-leh and, across country, with Sigli, on the north-east coast, whence it proceeds to Kuala Simpang (Aru bay), where it joins up with a coastal line southward to Tandjung Balai. An agricultural adviser, representing the department of agriculture, trade and industry, is stationed at Kota Raja, and the town has a population of 9,882, composed of 912 Europeans and Eurasians, 6,251 natives, and 2,719 foreign Asiatics. The principal industries of Achin are silk-weaving, gold-working, wood-carving and ship-building, and there is a fishing and coasting trade. Rice is the food staple, grown more under *sawah* culture than *ladang*, and there are irrigation works for rice culture. Pepper, copra and palm oil are the chief exports, but sugar-cane and fruit trees are grown, cattle-breeding is carried on, and there are over 20,000 acres under rubber (Hevea). Imports (1925) 8,688,052 and exports 20,881,154 guilders. Pop. (1925) 740,340, composed of—Europeans and Eurasians 2,428, natives 723,471, and foreign Asiatics, including Chinese, 14,441. The Achinese are Malayan, but smaller and thinner than the Malays, with darker skin and larger eyes. The people of the highlands (*orang tunōng*) are prouder and more courageous and independent than those of the lowlands (*orang barōh*), but both are fond of warfare. The nobility usually claim Arab descent, and there are evidences of old-time contact with Hindus. Both men and women wear the characteristic wide Achinese trousers; the women are skilful weavers; the men fairly good craftsmen and skilled agriculturists. Rice, fish and vegetables, eaten twice daily, form the usual fare, betel-nut is used universally, and opium-smoking is indulged in, but strong drink is used only amongst the upper classes. Houses are built on piles, divided into several rooms, generally with front and back verandah, reached by steps. They stand in a fenced courtyard, with fruit trees about them,—the domestic animals and birds live underneath—and are usually untidy in appearance. In a *meneusah*, without the village, the young unmarried men and strangers sleep, and it is also used for meetings and religious observances. Society is divided into families; there are traces of an old matriarchal form, but the patriarchal system is now general. Marriage is celebrated at an early age, divorce is rare, and polygamy is not common, except amongst the highest classes. The position of the Achinese woman is high. Achin is under direct Dutch Government, but many Achinese chiefs exercise authority as Government officials. The Achinese are Mohammedans.

The people are fond of competitions in recitations of poetry, and of musical performances on native instruments; also of feasts and gambling, whilst animals are kept for fighting purposes.

See C. Snouck Hurgronje, *The Achehnese* (Leyden, 1906).
(E. E. L.)

HISTORY

Northern Sumatra was visited by a number of European travellers in the middle ages, for example Marco Polo, Friar Odorico and Nicolo Conti (*qq.v.*). But the first voyager to visit Achin, known then by that name, was Alvaro Tellez, a captain of Tristan d'Acunha's fleet, in 1506. It was then a mere dependency of the adjoining state of Pedir. By 1526 Achin had assimilated all the other states of northern Sumatra, but its power was at its height in the time of Sultan Iskandar Muda (1607-36). At that period the territory extended from Aru opposite Malacca round the north to Benkulen on the west, 1,100 miles of seaboard; the island of Nias with the continental states of Johor, Pahang, Kedah and Perak were subject states.

The traders of the 17th century went to Achin for gold. The first Dutch (1599) and first English (1602) commercial ventures to the Indies were to Achin. Letters were sent from Queen Elizabeth and King James I. to the princes of Achin. But jealousy and suspicion interfered with trade and the English factory, erected several times, was not long maintained. The French attempted unsuccessfully in 1621 to establish relations as, in spite of all difficulties, the trade was important. William Dampier (*c.* 1688) speaks of the number of foreign merchants settled there.

The Portuguese were constantly warring with the kings of Achin until the former lost Malacca (1641). Iskandar Muda sent 60,000 men against Malacca in 1615, but the Portuguese held out. From 1641 four queens successively reigned over Achin, but in 1699 the Arab or fanatical party suppressed female government and put a chief of Arab blood on the throne. From that time Achin's power decayed rapidly.

After the restoration of Java to the Netherlands in 1816 a good deal of weight was attached by the neighbouring British colonies to the maintenance of influence in Achin, and in 1819 a treaty of friendship was concluded by Achin with the Calcutta Government which excluded other European nationalities from fixed residence in Achin. When the British Government, in 1824, made a treaty with the Netherlands, surrendering the remaining British settlements in Sumatra in exchange for certain possessions on the continent of Asia, no reference was made in the articles to the Indian treaty of 1819; but an understanding was exchanged that it should be modified, while no proceedings hostile to Achin should be attempted by the Dutch.

This reservation was formally abandoned by the British Government in a convention signed at The Hague on Nov. 2, 1871; and in March 1873 the Government of Batavia declared war upon Achin. Doubtless there was provocation, for the sultan of Achin had not kept to the understanding that he was to guarantee immunity from piracy to foreign traders; but the necessity for war was greatly doubted, even in Holland. A Dutch force landed at Achin in April 1873 and attacked the palace, but was defeated. Another attempt ended in the fall of Achin in Jan. 1874. General van der Heyden seemed to have quelled them (1878-81), but in 1896 they revolted again and not till 1898 and the succeeding year did General van Hentsz restore order. In 1901 the pretender-sultan fled to the Gajoes, a neighbouring tribe inland and for three years heavy fighting went on. Due to the pretender's escape the Dutch have had continual trouble, and, although the coast of Achin is subdued, the interior is still independent and troublesome.

See P. J. Veth, *Achin en zijne betrekkingen tot Nederland* (Leyden, 1873); J. A. Kruijt, *Atjeh en de Atjehers* (Leyden, 1877); Kielstra, *Beschrijving van den Atjeh-oorlog* (The Hague, 1885); Renaud, *Jaarboek van het Mynwezen* (1882); J. Jacobs, *Het familie-en Kampong-geleven op Groot Atjeh* (Leyden, 1894); C. Snouck Hurgronje, *De Atjehers* (Batavia, 1894, trans. 1906); W. Volz, *Nord-Sumatra; Die Gajoländer* (Berlin, 1912). See also *Tijdschrift voor Taal en Volkenkunde Nederlandsche Indië*.

ACHINESE, a Sumatran tribe of Proto-Malayan stock modified by Hindu and Arab elements, the darker complexion of the

lowlanders as distinct from the highlanders of the tribe being attributed to a greater infusion of South Indian blood. They are Muslims, but not very strict, and early in the 13th century became important in the East Indies, having commercial and political relations with Egypt, Europe and Japan. Noted for valour and love of freedom, they long maintained their independence against the Dutch. They are excellent craftsmen; women go unveiled and there is very little polygamy. Their language, though Malayan, contains many Sanskrit words, and there are other remnants of their former Hindu or Buddhist culture.

See E. Marsden, *History of Sumatra* (1783); C. Snouck Hurgronje, *The Achehnese* (1906).

ACHINSK. (1) A province in the Siberian area of the R.S.F.S.R. Area 65,204sq.km. Pop. (1926) 392,000; urban 24,997; rural 367,003. It consists of pine, spruce and birch forest, with open grassy areas on which rye and wheat are grown by the peasants and immigrant colonists. The winter is severe and occasionally early frosts ruin the crops. Gold is found to the west of the town of Achinsk. (2) A market centre, lat. 56° 30' N., long. 90° 35' E., on the Chulym river, which links it with the Ob river. It is on the Trans-Siberian railway and has a branch to the rich Minusinsk district.

ACHOLI, a negro people of the upper Nile valley, akin to the Shilluks of the White Nile. They frequently decorate the temples or cheeks with wavy or zigzag scars, and also the thighs with scrolls; some pierce the ears. Their huts are circular with a high peak, a mud sleeping-platform, jars of grain and a sunk fireplace; they are decorated with geometrical or conventional designs in red, white or grey. The Acholi are good hunters, using nets and spears, and keep goats, sheep and cattle. In war they use spears and long, narrow shields of giraffe or ox hide. Their language is Nilotic. Their religion is a vague fetishism.

ACHROMATIC LENS, a combination of two or more lenses corrected for chromatic aberration. (See OPTICS; LENS; PHOTOGRAPHY: *Apparatus*.)

ACHURCH, JANET (Mrs. C. CHARRINGTON) (1864-1916), English actress, was born in Manchester. She first appeared at the Olympic Theatre, London, Jan. 8, 1883, with Geneviève Ward in the farce of *Betsy Baker*. Two years later she joined Frank Benson's company and played Shakespearean heroines; but her chief success was gained as Nora Helmer in Ibsen's *A Doll's House*, when that play was first produced in England in 1889. She appeared later in other Ibsen plays and in those of Bernard Shaw.

ACID, the name loosely applied to any sour substance; in chemistry it has a more precise meaning, denoting a substance containing hydrogen which may be replaced by metals with the formation of salts. An acid may therefore be regarded as a salt of hydrogen. A still more recent and broader conception is that of an acid as a "proton donator" (T. M. Lowry) *i.e.*, a substance which is capable of yielding a hydrogen atom stripped of its electron to a "proton acceptor" or base. Of the general characters of acids we may here notice that they dissolve alkaline substances, certain metals, etc., neutralize alkalis and redden many blue and violet vegetable colouring matters such as litmus.

The ancients probably possessed very little knowledge of acids. Vinegar (or impure acetic acid), which is produced when wine is allowed to stand, was known to both the Greeks and Romans, who considered it to be typical of acid substances; this is philologically illustrated by the words *ὄξυς*, *acidus*, sour, and *ὄξος* *acetus*, vinegar. Other acids became known during the alchemistic period; and the first attempt at a generalized conception of these substances was made by Paracelsus, who supposed them to contain a principle which conferred the properties of sourness and solubility. Somewhat similar views were promoted by Becher, who named the principle *acidum primogenium*, and held that it was composed of the Paracelsian elements "earth" and "water." At about the same time Boyle investigated several acids and established their general characteristics.

The phlogistic theory of the processes of calcination and combustion necessitated the view that many acids, such as those produced by combustion, *e.g.*, sulphurous, phosphoric, carbonic, etc.,

should be regarded as elementary substances. This principle more or less prevailed until it was overthrown by Lavoisier's doctrine that oxygen was the acid-producing element; Lavoisier was led to this conclusion by the almost general observation that acids were produced when non-metallic elements were burnt. This doctrine, in turn, was overthrown by the researches of Davy, Gay-Lussac and Thénard on hydrochloric acid and chlorine, and of Gay-Lussac on hydrocyanic acid, which established beyond all cavil that oxygen was not essential to acidic properties. Davy and, almost simultaneously, Dulong suggested that hydrogen and not oxygen was the acidifying principle.

Dalton's theory was strongly supported when J. Liebig promoted his doctrine of polybasic acids. Dalton's idea that elements preferentially combined in equiatomic proportions had as an immediate inference that metallic oxides contained one atom of the metal to one atom of oxygen, and a simple expansion of this conception was that one atom of oxide combined with one atom of acid to form one atom of a neutral salt. This view, which was specially supported by Gay-Lussac and Leopold Gmelin and accepted by Berzelius, necessitated that all acids were monobasic. The untenability of this theory was proved by Thomas Graham's investigation of the phosphoric acids; for he then showed that the ortho- (ordinary), pyro- and meta-phosphoric acids contained respectively 3, 2 and 1 molecules of "basic water" (which were replaceable by metallic oxides) and one molecule of phosphoric oxide, P_2O_5 . Graham's work was developed by Liebig, whose researches on organic acids—citric, tartaric, cyanuric, comenic and meconic—led him to formulate as the criterion of polybasicity the existence of compound salts with different metallic oxides, and ultimately to adopt the tenet that "acids are particular compounds of hydrogen, in which the latter can be replaced by metals." Further, he held that "neutral salts are those compounds of the same class in which the hydrogen is replaced by its equivalent in metal."

The hydrogen theory and the doctrine of polybasicity as enunciated by Liebig is the fundamental characteristic of the modern theory. A polybasic acid contains more than one atom of hydrogen which is replaceable by metals; moreover, in such an acid the replacement may be entire with the formation of normal salts, partial with the formation of acid salts, or by two or more different metals with the formation of compound salts (*see* SALTS). These facts may be illustrated with the aid of orthophosphoric acid, which is tribasic:

Normal salt.	Acid salts:	Compound salt.
Ag_3PO_4	Na_2HPO_4 ; NaH_2PO_4	$Na(NH_4)HPO_4$
Silver phosphate.	Acid sodium phosphates.	Microcosmic salt.

This conception of acids was extended along the lines of the electrolytic dissociation theory of S. A. Arrhenius (1887). Pure hydrogen chloride is practically a non-conductor of the electric current, and so also is pure water; when the two are mixed, however, highly conducting solutions of hydrochloric acid result. According to the Arrhenius hypothesis, the hydrogen chloride molecule was split into two "ions"—a positive hydrogen ion, written as H^+ or H' , and a negative chlorine ion, Cl^- or Cl' —each of which contributed towards the carrying of the current; all the fundamental properties of acids were attributed to the existence of the hydrogen ion in their aqueous solutions. Objections often urged against this view were (1) that the chlorine ion shows none of the peculiar properties of the element, and (2) that, since hydrogen and chlorine combine so strongly with such a large evolution of heat, it was difficult to understand how the mere process of dissolution in water could suffice to separate them as ions. To a large extent these objections are met by the current views on the electronic structure of atoms (*q.v.*), according to which the chlorine atom, holding seven valency electrons, achieves its maximum stability by acquiring the single electron of the hydrogen atom to form an octet and to become negatively charged, whereas the hydrogen atom, having lost its electron and become positively charged is now unique in that it holds no electrons at all (*i.e.*, it is what is called a proton); these ions differ fundamentally, therefore, from their corresponding elements.

It will be noted that, although the solvent (water, in the case

discussed) was stated to be essential for the development of the acidic properties of hydrogen chloride, the various theories described attach no significance to the rôle of this solvent. H. E. Armstrong has consistently pointed out this anomaly, and he and many others (A. Lapworth, H. Goldschmidt, and T. M. Lowry, for example) have attempted to remove it; for Armstrong's views his writings should be consulted (*Proc. Roy. Soc.*, 1923, A, 103, p. 610), but it is possible to generalize as to the trend of other workers' views. These are, briefly, that the hydrogen ion (proton) becomes associated with one or more molecules of solvent to give positive ions, of which the simplest would be OH_4^+ . Here again there is a divergence of opinion, because some attribute the peculiar properties of acids (especially that of catalysis [*q.v.*]) to this complex ion, whereas others ascribe them to a small or even a very minute portion of hydrogen ions which remain as such and escape this association with the solvent.

Studies of the absorption spectra and other properties of acids, their esters, their dilute solutions, and their saline solutions have led to the belief, more especially in the case of oxygen-containing acids, that the pure or concentrated acid has a structure resembling that of the esters (A. Hantzsch, K. Schäfer), whereas in dilute aqueous solution its structure is analogous to that of the salts. In this respect, the pure acid is what Hantzsch terms a pseudo-acid—that is, it only functions as a true acid after having undergone a change of structure. Such a change is indicated by Schäfer's scheme below, which, however, is merely diagrammatic and has no other significance.

It is remarkable that very pure concentrated acids are inert towards metals in many cases. V. H. Veley has made a study of the properties of pure nitric acid, which, according to Hantzsch, has the same absorption spectrum as its vapour or its esters, but quite different from that of dilute solutions. Hantzsch (1925) found similar relationships to hold for hydrobromic and hydriodic acids, and he therefore suggests that aqueous solutions of acids are salts of the hypothetical "hydroxonium" radical, thus: $[H_3O]Br$, hydroxonium bromide; $[H_3O]NO_3$, hydroxonium nitrate. His views receive support from the isolation of "nitronium" salts from very concentrated solutions of acids; thus, nitronium diperchlorate, $[N(OH)_3][ClO_4]_2$, and nitronium monoperochlorate, $[NO(OH)_2]ClO_4$, are stable crystalline salt-like compounds which can be recrystallized from concentrated perchloric or nitric acid, respectively. Moreover, mixtures of concentrated nitric and sulphuric acids are highly conducting, whereas the pure acids alone are only feebly so; this is regarded as evidence in favour of the existence of salt-like compounds in the solution, $[N(OH)_3][HSO_4]_2$ and $[NO(OH)_2][HSO_4]$ analogous to the perchlorates, and the isolation (by Weber, 1871) of nitronium pyrosulphate, $[N(OH)_3]S_2O_7$, affords similar evidence. By analogy, therefore, concentrated nitric acid contains a certain amount of nitronium nitrate, $[N(OH)_3](NO_3)_3$.

Reference should be made to the articles **CHEMICAL ACTION** and **SOLUTIONS** for the theory of the strength or avidity of acids.

Organic Acids.—Purely organic acids are characterized by the presence of the univalent group— $CO\cdot OH$, termed the carboxyl group, in which the hydrogen atom is replaceable by metals with the formation of salts, and by alkyl radicals with the formation of esters. The basicity of an organic acid, as above defined, is determined by the number of carboxyl groups present. Hydroxy-acids are carboxylic acids which also contain a hydroxyl group; similarly we may have aldehyde-acids, ketone-acids, etc. Since the more important acids are treated under their own headings, or under substances closely allied to them, we shall here confine ourselves to general relations.

It is convenient to distinguish between aliphatic and aromatic

acids; the first named being derived from open-chain hydrocarbons, the second from ringed hydrocarbon nuclei. Aliphatic monobasic acids are further divided according to the nature of the parent hydrocarbon. Methane and its homologues give origin to the "paraffin" or "fatty series" of the general formula $C_nH_{2n+1}COOH$, ethylene gives origin to the acrylic acid series, $C_nH_{2n-1}COOH$, and so on. Dibasic acids of the paraffin series of hydrocarbons have the general formula $C_nH_{2n}(COOH)_2$; malonic and succinic acids are important members. It is evident from the foregoing general formulae that the complications due to isomerism will increase with the length of the chain of carbon atoms, and for further information on the higher or more complicated acids the reader is referred to any standard work on organic chemistry (see CHEMISTRY: *Organic*). A list of certain of the acids present in fats and oils is given in the article GLYCERIDES.

Syntheses of Salts of Organic Acids.—The simplest syntheses are undoubtedly those in which a carboxyl group is obtained directly from the oxides of carbon, carbon dioxide and carbon monoxide. The simplest of all include: (1) the synthesis of sodium oxalate by passing carbon dioxide over metallic sodium heated to 350° – 360° C; (2) the synthesis of potassium formate from moist carbon dioxide and potassium, potassium carbonate being obtained simultaneously; (3) the synthesis of potassium acetate and propionate from carbon dioxide and sodium methide and sodium ethide; (4) the synthesis of salts of aromatic acids by the interaction of carbon dioxide, sodium and a bromine substitution derivative; (5) the synthesis of aromatic hydroxy-acids by the interaction of carbon dioxide and sodium phenolates (see SALICYLIC ACID). Carbon monoxide takes part in the syntheses of sodium formate from sodium hydroxide, or soda lime (at 200° – 220° C), and of sodium acetate and propionate from sodium methoxide and sodium ethoxide at 160° – 200° C. Carboxyl is introduced into aromatic groups by the action of carbonyl chloride on aromatic hydrocarbons in the presence of aluminium chloride, acid-chlorides being formed which are readily decomposed by water to give the acid. The saponification of nitriles, obtained by the interaction of potassium cyanide with a halogen substitution derivative or a sulphonic acid, leads successively to acid-amides and acids. (See AMIDES.)

Acids frequently result as oxidation products, being almost invariably formed in all cases of energetic oxidation. The higher fatty hydrocarbons (waxes) when subjected to long treatment with oxygen at 100° C with or without a terpenoid catalyst yield fatty acids similar to palmitic and stearic acids (F. Francis, 1924). Also, primary alcohols and aldehydes (*q.v.*), both of the aliphatic and aromatic series, readily yield on oxidation acids containing the same number of carbon atoms. These reactions may be shown thus: $R\cdot CH_2OH \rightarrow R\cdot CHO \rightarrow R\cdot CO\cdot OH$. In the case of aromatic aldehydes, acids are also obtained by means of "Cannizzaro's reaction" (see BENZALDEHYDE). An important oxidation synthesis of aromatic acids is from hydrocarbons with aliphatic side chains; thus toluene, or methyl-benzene, yields benzoic acid; the xylenes, or dimethyl-benzenes, yield methyl-benzoic acids and phthalic acids. Ketones, secondary alcohols and tertiary alcohols yield a mixture of acids on oxidation. We may also notice the disruption of unsaturated acids at the double linkage into a mixture of two acids, when fused with potash. In the animal organism fatty acids are converted by oxidation at the β -carbon atom into simpler acids of lower carbon content. This oxidation is also effected by purely chemical means by hydrogen peroxide and potassium persulphate.

Phenylpropionio acid, $C_6H_5\cdot CH_2\cdot CH_2\cdot CO_2H$, is eliminated in urine as hippuric acid, $C_6H_5\cdot CO\cdot NH_2\cdot CH_2\cdot CO_2H$.

Mention should also be made of syntheses of organic acids through the Grignard reaction (*q.v.*) and through malonic ester and acetoacetic ester (*q.v.*, and CHEMISTRY: *Organic*). By electrolysis a solution of potassium ethyl succinate,

the $KO_2C\cdot$ groups are split off and the two residues

combine to form the ester $(CH_2)_4(CO_2C_2H_5)_2$. In the same way,

by electrolysis a mixture of a metallic salt and an ester, other nuclei may be condensed; thus potassium acetate and potassium ethyl succinate yield $CH_3\cdot CH_2\cdot CH_2\cdot CO_2C_2H_5$.

(A. D. M.; G. T. M.)

Lunge and Cummings, *Manufacture of Acids and Alkalis* (1923).

ACIDALIUS, VALENS (1567–1595), German scholar and critic, was born at Wittstock on May 25, 1567, and died at Neisse on May 25, 1595, at the age of 28. Acidalius wrote notes on Velleius Paterculus (1590), Curtius (1594), the panegyrists, Tacitus and Plautus, published after his death.

See Leuschner, *Commentatio de A. V. Vita, Moribus, et Scriptis* (1757).

ACID BASE EQUILIBRIUM: see DIET AND DIETETICS.

ACIDIMETRY, the determination of the quantity of free acid (*q.v.*) in a substance. There are several methods of estimation, one of the chief being by volumetric analysis (*q.v.*). A convenient method for the aqueous solution of a fairly pure acid is the determination of its specific gravity by means of a hydrometer (*q.v.*). (See CHEMISTRY: *Analytical*.)

ACINACES, from the Greek. An ancient Persian sword, short and straight, and worn, contrary to the Roman fashion, on the right side, or sometimes in front of the body, as shown in the bas-reliefs found at Persepolis. Among the Persian nobility it was frequently made of gold, being worn as a badge of distinction. The acinaces was an object of religious worship with the Scythians and others (Herod. iv. 62).

ACIREALE (anc. ACIS), town and episcopal see, province of Catania, Sicily; 9m. N.E. from Catania by rail. Pop. (1921) 22,956 (town), 31,161 (commune). The thermal springs were used by the Romans. It took its name from the river Acis, into which Acis, the lover of Galatea, was changed after he had been slain by Polyphemus.

ACIS, in Greek mythology, the son of Pan (Faunus) and the nymph Symaethis, a beautiful shepherd of Sicily, the lover of the Nereid Galatea. His rival the Cyclops Polyphemus surprised them together, and crushed him to pieces with a rock. His blood, gushing forth from beneath, was metamorphosed by Galatea into the river bearing his name (now Fiume di Jaci) (Ovid, *Met.* xiii. 750; Silius Italicus, *Punica*, xiv. 221).

ACKER, CHARLES ERNEST (1868–1920), American inventor and manufacturer, was born in Bourbon, Ind., on March 19, 1868. Following his graduation at Cornell university in 1888 he practised electrical engineering in Chicago, Ill., until 1893. He originated a process for making caustic soda from molten salt by electrolysis, and established works in Niagara Falls, N.Y., for the manufacture of soda and other chemical products. He devised various other chemical and electro-chemical processes, and obtained numerous patents for his inventions pertaining to electro-chemical manufacture. In recognition of his services to chemical technology he was awarded in 1902 the Elliott Cresson medal of the Franklin institute. He died in Ossining, N.Y., on Oct. 18, 1920.

ACKERMAN, FRANCIS (c. 1335–87), Flemish soldier and diplomat, was born at Ghent. He was partly responsible for inducing Philip van Artevelde to become first captain of the city of Ghent in 1382. He secured for Ghent assistance from the citizens of Brussels, Louvain and Liège, and, as admiral of the Flemish fleet, visited England and obtained a promise of help from King Richard II. After Artevelde's death in Nov. 1382, Ackerman acted as leader of the Flemings. He took part in the conclusion of the treaty of peace between Ghent and Philip the Bold, duke of Burgundy, in Dec. 1385. Trusting in Philip, and ignoring the warnings of his friends, Ackerman remained in Flanders and was murdered at Ghent on July 22, 1387, leaving a memory of chivalry and generosity.

See Jean Froissart, *Chroniques*, ed. S. Luce and G. Raynaud (Paris, 1869–97); Johannes Brandon, *Chronodromon*, ed. K. de Lettenhove in the *Chroniques relatives à l'histoire de la Belgique sous la domination des ducs de Bourgogne* (Brussels, 1870).

ACKERMANN, LOUISE VICTORINE CHOQUET (1813–1890), French poet, was born in Paris on Nov. 30, 1813. Educated by her father in the philosophy of the encyclopaedists, Victorine Choquet went to Berlin in 1838 to study German, and there married in 1843 Paul Ackermann, an Alsatian philologist.

After little more than two years of happy married life her husband died, and Mme. Ackermann went to live at Nice. In 1855 she published *Contes en vers*, and in 1862 *Contes et poésies*. Very different from these simple and charming *contes* is the work on which Mme. Ackermann's real reputation rests. She published in 1874 *Poésies, premières poésies, poésies philosophiques*, a volume of sombre and powerful verse, expressing her revolt against human suffering. Soon after the publication of this volume Mme. Ackermann removed to Paris, where she gathered round her a circle of friends, but published nothing further except a prose volume, the *Pensées d'une solitaire* (1883, Eng. trans., Glasgow, 1921), to which she prefixed a short autobiography. She died at Nice on Aug. 2, 1890.

See also Anatole France, *La vie littéraire*, 4th series (1892); the comte d'Haussonville, *Mme. Ackermann* (1882); M. Citoleux, *La poésie philosophique au XIX^e siècle* (vol. i. 1906); O. B. P. G. de Cléron, *Mme. Ackermann d'après des lettres et des papiers inédits* (1892).

ACKERMANN, RUDOLPH (1764-1834), Anglo-German inventor and publisher, was born on April 20, 1764 at Schneeberg, in Saxony. He had been a saddler and coach-builder for ten years in different German cities and in Paris and London, when, in 1795, he established a print-shop and drawing school in the Strand. Ackermann set up a lithographic press, and applied it in 1817 to the illustration of his *Repository of Arts, Literature, Fashions, etc.* (monthly until 1828). Rowlandson and other distinguished artists were regular contributors. He also introduced the fashion of the once popular English annuals, beginning in 1825 with *Forget-me-not*; and he published many illustrated volumes of topography and travel, *The Microcosm of London* (1808-11), *Westminster Abbey* (1812), *The Rhine* (1820), *The World in Miniature* (1821-26), etc. Ackermann was an enterprising man; he patented (1801) a method for rendering paper and cloth waterproof, erected a factory at Chelsea for the purpose and was one of the first to illuminate his own premises with gas. Indeed the introduction of lighting by gas owed much to him. After the battle of Leipzig Ackermann collected nearly a quarter of a million sterling for German sufferers. He died at Finchley, Middlesex, on March 30, 1834.

ACKNOWLEDGMENT, an admission that something has been given or done, a term used in law in various connections. The acknowledgment of a debt, if in writing signed by the debtor or his agent, is sufficient to take it out of the Statutes of Limitations. The signature to a will by a testator, if not made in the presence of two witnesses, may be afterwards acknowledged in their presence. The acknowledgment by a woman married before 1882 of deeds for the conveyance of real property, not her separate property, requires to be made by her before a judge of the High Court, or of a county court, or before a perpetual or special commissioner. Before such an acknowledgment can be received, the judge or commissioner is required to examine her apart from her husband, touching her knowledge of the deed, and to ascertain whether she freely consents. In some British colonies this acknowledgment applies even to separate estates. An acknowledgment to the right of the production of deeds of conveyance is an obligation on the vendor, when he retains any portion of the property to which the deeds relate, and is entitled to retain the deeds, to produce them from time to time at the request of the person to whom the acknowledgment is given, to allow copies to be made, and to undertake for their safe custody (Conveyancing Act, 1881, section 9). The term "acknowledgment" is, in the United States, applied to the certificate of a public officer that an instrument was acknowledged before him to be the deed or act of the person who executed it. "Acknowledgment money" was the sum paid in some parts of England by copyhold tenants on the death of the lord of the manor.

AKTÉ-JALANDER, AÏNO (1876-), Finnish opera singer, studied singing in Paris, and later was for a number of years (1897-1904) one of the leading sopranos at the Grand Opéra, where her exceptional powers won general recognition. In 1904 she went to New York, where she was no less successful at the Metropolitan Opera (1904-06). In 1907 she paid her first visit to England, taking part in a winter season at Covent Garden,

under the management of Ernest van Dyck. In 1910 she was again at Covent Garden, attracting this time much attention in the title part of Strauss's "Salome" on the occasion of its first production in England by Sir Thomas Beecham. Subsequently she settled down in her native Finland, where she enjoys the highest favour.

ACLAND, SIR HENRY WENTWORTH, BART. (1815-1900), English physician and man of learning, was born near Exeter on Aug. 23, 1815, and died at Oxford on Oct. 16, 1900. He was regius professor of medicine at Oxford from 1858 to 1894. He was also a curator of the university galleries and of the Bodleian Library, and from 1858 to 1887 he represented his university on the General Medical Council, serving as president from 1874 to 1887. Acland took a leading part in the revival of the Oxford medical school and in introducing the study of natural science into the university. The establishment of the Oxford university museum, opened in 1861, as a centre for the encouragement of the study of science, especially in relation to medicine, was largely due to his efforts. "To Henry Acland," said his lifelong friend, John Ruskin, "physiology was an entrusted gospel of which he was the solitary preacher to the heathen" at Oxford. Acland published a study of the outbreak of cholera at Oxford in 1854, together with various pamphlets on sanitary matters, and served on the royal commission on sanitary laws in England and Wales, in 1869.

See *Sir Henry Wentworth Acland*, a memoir by J. B. Atlay, with portraits (1903).

ACME, the highest point attainable. (Gr. ἀκμή, point.)

ACMITE or **AEGIRITE**, a mineral of the pyroxene (*q.v.*) group, essentially a sodium and ferric metasilicate, $\text{NaFe}(\text{SiO}_3)_2$. In its crystallographic characters it is close to ordinary pyroxene (augite and diopside), being monoclinic and having nearly the same angle between the prismatic cleavages. There are, however, important differences in the optical characters; the birefringence of acmite is negative, the pleochroism is strong and the extinction angle on the plane of symmetry measured to the vertical axis is small (3° - 5°). The hardness is 6-6½, and the specific gravity 3.55. Crystals are elongated in the direction of the vertical axis, and are blackish green (aegirite) or dark brown (acmite) in colour. It is isomorphous with augite; mixed crystals are not uncommon.

The mineral is a characteristic constituent of igneous rocks rich in soda, such as nepheline-syenites, phonolites, etc. It was first discovered as slender crystals, sometimes a foot in length in the pegmatite veins of the granite of Rundemyr, near Kongsberg in Norway, and was named by F. Stromeyer in 1821 from the Gr. ἀκμή, a point, in allusion to the pointed terminations of the crystals. Acmite forms an important constituent of a granitic rock (rockallite) occurring on the islet of Rockall in the North Atlantic, and is notable for its content of zirconia 2.68%. Aegirite (named from Aegir, the Scandinavian sea-god) was described in 1835 from the elaeolite-syenite of southern Norway. The essential identity of acmite and aegirite has long been established.

ACNE, a skin eruption produced by inflammation of the sebaceous glands and hair follicles, the essential point in the disease being the plugging of the mouths of the sebaceous follicles by a "comedo," familiarly known as "blackhead." It is generally acknowledged that the cause of this disease is a specific organism (*B. acnes*). The affection occurs in the form of red pimples or papules, which may become pustular and be attended with much surrounding irritation of the skin. It is commonest in early adult life, and occurs on the chest and back as well as on the face, where it may, when of much extent, produce great disfigurement. It is apt to persist for months or even years, but usually in time disappears entirely, although slight traces may remain in the form of scars or stains upon the skin. Acniform eruptions are sometimes produced by the internal use of certain drugs, such as the iodide or bromide of potassium.

Treatment.—The face should be held over steaming water for several minutes, and then thoroughly bathed. The blackheads should next be removed, not with the finger-nail, but with an inexpensive little instrument known as the "comedo expressor." When the more noticeable of the blackheads have been expressed, the face should be firmly rubbed for three or four minutes with a lather made from a special soap composed of sulphur, camphor

and balsam of Peru. Any lather remaining on the face should be wiped off with a soft handkerchief. As this treatment might give rise to some irritation of the skin, it should be replaced every fourth night by a simple application of cold cream. Of drugs used internally sulphide of calcium, in pill, $\frac{1}{2}$ grain three times a day is a useful adjunct. The patient should take plenty of exercise in the fresh air, a very simple but nourishing diet, and, if present, constipation and anaemia must be suitably treated.

Acne rosacea is a more severe and troublesome disorder, a true dermatitis with no relation to the foregoing, and in most cases secondary to seborrhea of the scalp. It is characterized by great redness of the nose and cheeks, accompanied by pustular enlargements on the surface of the skin, which produce marked disfigurement. Although often seen in persons who live too freely, it is by no means confined to such, but may arise in connection with disturbances of the general health, especially of the function of digestion, and in females with menstrual disorders. It is exceedingly intractable to treatment, which is partly local and partly constitutional. Of internal remedies preparations of iodine and of arsenic are sometimes found of service.

ACOELOMATA, a word sometimes used in zoology in contradistinction to Coelomata (*q.v.*) to denote those animals in which no second body cavity (coelom, *q.v.*) is present. The group includes the Coelenterata and Platyhelminthes (*qq.v.*).

ACOEMETI, an order of Eastern monks who celebrated the divine service without intermission day or night (Gr. ἀκοιμητος, sleepless). This was done by dividing the communities into choirs, which relieved each other by turn in the church. Their first monastery was established on the Euphrates in the beginning of the 5th century. In Constantinople (*c.* 460) the famous monastery of the Studium, founded by the consular Studius, was put in the hands of the Acoemeti and became their chief house, so that they were sometimes called Studites.

BIBLIOGRAPHY.—See the article in Smith and Cheetham, *Dictionary of Christian Antiquities*; Herzog-Hauck, *Realencyklopädie* (3rd ed.); also the general histories of the time.

ACOLYTE, the highest of the four minor orders in the Roman Church (Gr. ἀκόλουθος, follower). The office is unknown in the Eastern Church, except among the Armenians who borrowed it from the West. Before the Council of Nicaea (325) it was only found at Rome and Carthage. In 251, Pope Cornelius, in a letter to Fabius of Antioch, mentions among the Roman clergy 42 acolytes, placing them next after the subdeacons (Eusebius, *Hist. Eccl.* vi. 43), giving no hint that the office was a new one. The *Liber Pontificalis* says that Pope Victor (186–197) made *sequentes clerici*, a term which may possibly denote acolytes. While the office was well known in Rome, it was evidently not at first an order through which, as to-day, every candidate to the priesthood must pass. St. Cyprian of Carthage (200?–258) used acolytes to carry his letters, but this seems to be the only place in Africa where they were known. The Irish Church did not know them; and in Spain the Council of Toledo (400) makes no mention of them. The *Statuta Ecclesiae Antiqua*, a Gallican collection for the province of Arles, early 6th century, mentions the acolyte, but does not give, as for the other orders, any form of ordination. The Roman books are silent, and in the *Leonine Sacramentary* and the so-called *Gelasian Mass-book* there is the same silence, though one ms. of the 10th century, given by Muratori, contains a form of ordination of an acolyte. The office is often mentioned in the *Ordines Romani*, but only in *Ordo VIII.* (not earlier than 7th century) do we find a very simple form for admitting an acolyte to his office. The evidence available, therefore, indicates that the acolyte was only a local office, not a necessary step to sacred orders. In England, acolytes first occur, both as office and order, in the Pontifical attributed to Egbert of York (732–766); and Aelfric (1006) in both his pastoral epistle and canons mentions the acolyte. It would seem, then, that the acolyte became an order in the Gallican Church first, and afterwards found its way as such into the Roman books before the fusion of the two rites under Charlemagne.

The duties of the acolyte, as given in the Roman Pontifical, are identical with those mentioned in the *Statuta Ecclesiae*

Antiqua of Arles: “to carry the candlesticks, to light the lamps of the church, to administer wine and water for the Eucharist.” The *Ordines Romani* divides the acolytes into *Palatini*, who served the pope at the Lateran palace, *Stationarii*, who served at churches where there was a “station,” and *Regionarii*, or those attached directly to the regions; and gives us a glimpse of their duties. When the pope rode in procession to the station an acolyte walked before him, bearing the holy chrism; and at the church seven acolytes with candles went before him to the altar, while two others, bearing the vessel that contained a consecrated Host, presented it for his adoration. At the communion the acolytes received in linen bags the consecrated Hosts to carry to the assisting priests. The official dress of the acolyte (*Ordo V.*) was a close-fitting linen garment (*camisia*), a napkin hanging from the left side, a white tunic, a stole (*orarium*) and a chasuble (*planeta*) which he took off when he sang on the steps of the *ambo*.

At the present day the duties of acolytes are now performed, almost everywhere, by laymen. The office has been revived unofficially in the Church of England, as a result of the Tractarian movement.

See Morin, *Commentarius in sacris Ecclesiae ordinationibus*, ii. p. 209; iii. p. 152 (Antwerp, 1685); Martène, *De Antiquis Ecclesiae ritibus*, ii. pp. 47 and 86 (Antwerp, 1739); Mabillon, *Musaeum Italicum II.* for the *Ordines Romani*; Muratori, *Liturgia Romana Vetustas*; Cabrol, *Dictionnaire d'archéologie chrétienne et de liturgie*, vol. i. col. 348–536.

ACOMA, a tribe and town of the Pueblo Indians in New Mexico, forming an isolated western settlement of the Keres stock. The town is strikingly situated on a mesa rising 350 ft. sheer above the surrounding plain, in which lie the Pueblo farm-lands at a distance of some miles. It is reputed to be the oldest inhabited settlement in the United States, a distinction which, however, may be challenged by Zúñi and Oraibi. Discovered by Coronado's army in 1540, Acoma surprised and defeated a Spanish detachment in 1598, lost heavily in its subjugation next year, received a permanent mission early in the 17th century, rebelled with the other Pueblos in 1680, but was reconquered. The original population was perhaps 1,000, the present one is about 500.

ACOMINATUS (AKOMINATOS), **MICHAEL** (*c.* 1140–1220), Byzantine writer and ecclesiastic, was born at Chonae (the ancient Colossae). He studied at Constantinople, and about 1175 was appointed archbishop of Athens. After the capture of Constantinople by the Franks and the establishment of the Latin empire (1204), he retired to the island of Ceos, where he died. He wrote homilies, speeches and poems which, with his correspondence, throw considerable light upon the miserable condition of Attica and Athens at the time. His memorial to Alexis III. Angelus on the abuses of Byzantine administration, the poetical lament over the degeneracy of Athens, and the monodes on his brother Nicetas and Eustathius, archbishop of Thessalonica, deserve special mention.

BIBLIOGRAPHY.—Edition of his works by S. Lambros (1879–80); Migne, *Patrologia Graeca*, cxi.; see also A. Ellissen, *Michael Akominatos* (1846), containing several pieces with German translation; F. Gregorovius, *Geschichte der Stadt Athen im Mittelalter*, i. (1889); G. Finlay, *History of Greece*, iv. p. 133–134, (1877).

His younger brother, **NICETAS** (Niketas), sometimes called **CHONIATES**, who accompanied him to Constantinople, held several appointments under the Angelus emperors (amongst them that of “great logothete” or chancellor) and was governor of the “theme” of Philippopolis at a critical period. After the fall of Constantinople he fled to Nicaea, where he settled at the court of the emperor Theodorus Lascaris, and devoted himself to literature. He died between 1210 and 1220. His chief work is his *History*, in 21 books, of the period from 1180 to 1206. In spite of its florid style, it is of considerable value as a record (on the whole impartial) of events of which he was either an eye-witness or had heard at first hand. Its most interesting portion is the description of the capture of Constantinople. The little treatise *On the Statues* destroyed by the Latins (perhaps, as we have it, altered by a later writer), is of special interest to the archaeologist. His dogmatic work (Θρησκευτικὸν Ὁμολογιακόν, *Thesaurus Orthodoxae Fidei*), extant in a complete form in ms., is one of the

chief authorities for the heresies of the 12th century.

ACONCAGUA, a small northern province of central Chile, bounded on the north by Coquimbo, east by Argentina, south by Santiago and west by the Pacific. Its area, including Valparaíso, annexed in 1928, is 18,598sq. kilometers. Pop. (1920) including territory added in 1928, was 437,312; the 1926 estimate was 448,031. The province is very mountainous, and is traversed from east to west by the valley of the Aconcagua river. The climate is hot and dry, the rainfall being too small to influence climatic conditions. The valleys are highly fertile, and where irrigation is employed large crops are easily raised. Beyond the limits of irrigation the country is semi-barren. Alfalfa and grapes are the principal products, and considerable attention is given to the cultivation of other fruits, such as figs, peaches and melons. The Valle de Quillota, through which the railway passes between Valparaíso and Santiago, is celebrated for its gardens. The Aconcagua river rises on the southern slope of the volcano Aconcagua, the highest mountain in South America (more than 23,000ft.), first flows east down a broad valley, or bay in the mountains, and enters the Pacific 12m. N. of Valparaíso. The river has a course of about 200m., and its waters irrigate the best and most populous part of the province. Two other rivers—the Ligua and Choapa—traverse the province, the latter forming the northern boundary line. The capital is the seaport, Valparaíso, which had a population of 182,422 in 1920. Other important cities are Viña del Mar (pop. in 1920, 38,000), Santa Rosa (pop. in 1920, 29,002) and San Felipe, the former capital (pop. in 1920, 27,774). Santa Rosa is a principal station on the trans-Andine branch of the State railway. A second port is Los Vilos, whence a railway 40m. long runs north-east to the Choapa. Another line connects Cabildo, in the Ligua valley, with the State railway.

ACONCAGUA, an extinct volcano in the southern Andes with a height of about 23,000ft., usually regarded as the loftiest mountain in America. It is situated on the boundary line between Chile and Argentina in 32° 39' S. and 70° 1' W. On its southern slope is the source of the Aconcagua river which flows westerly to the Pacific ocean through a course of about 200 miles. The summit of Aconcagua was first scaled in 1897 by Vines and Zurbriegen of the FitzGerald expedition.

BIBLIOGRAPHY.—Edward Ambrose FitzGerald, "Exploration on and around Aconcagua," *Geographic Journal*, vol. xii., pp. 469-494 (1898) and "The First Ascent of Aconcagua," *McClure's Magazine*, vol. xi. (1898); Sir William Martin Conway, *Aconcagua and Tierra del Fuego* (1902).

ACONCIO, GIACOMO (1492-1566?), pioneer of religious toleration, was one of the Italians, like Peter Martyr and Bernardino Ochino, who repudiated Roman Catholic doctrine and ultimately found refuge in England, where he worked as an engineer on various public works. Before reaching England he had published a treatise on the methods of investigation, *De Methodo, hoc est, de recte investigandarum tradendarumque Scientiarum ratione* (1558); and his critical spirit placed him outside all the recognized religious societies of his time.

On his arrival in London he had joined the Dutch Reformed Church in Austin Friars, but he was "infected with Anabaptistical and Arian opinions" and was excluded from the sacrament by Grindal, bishop of London. The real nature of his heterodoxy is revealed in his *Stratagemata Satanae* (1565). The "stratagems of Satan" are the dogmatic creeds which rent the Christian church. Aconcio sought to reduce dogma to a minimum in the hope of finding a common denominator for the various creeds.

ACONITE (*Aconitum*), a genus of plants belonging to the Ranunculaceae, the buttercup family, commonly known as aconite, monkshood or wolfsbane, and embracing about 60 species, chiefly natives of the mountainous parts of the northern hemisphere. They are distinguished by having one of the five blue or yellow coloured sepals (the posterior one) in the form of a helmet; hence the English name monkshood. Two of the petals placed under the hood of the calyx are supported on long stalks, and have a hollow spur at their apex, containing honey. They are handsome plants, the tall stem being crowned by racemes of showy flowers. *Aconitum napellus*, common monkshood, is a doubtful native of Britain, and is of therapeutic and toxicological importance. Its roots have occasionally been mistaken for horse-radish. The aconite has a short underground stem, from which dark-coloured tapering roots descend. The crown or upper portion of the root gives rise to new plants. When put to the lip, the juice of the aconite root produces a feeling of numbness and tingling. The horse-radish root, which belongs to the family Cruciferae, is much longer than that of the aconite, and it is not tapering; its colour is yellowish, and the top of the root has the remains of the leaves on it.

Many species of aconite are cultivated in gardens, some having blue and others yellow flowers. *Aconitum lycoctonum*, wolfsbane, is a yellow-flowered species common on the Alps of Switzerland. The roots of *Aconitum ferox* supply the famous Indian (Nepal) poison called bikh, bish or nabe. It contains considerable quantities of the alkaloid pseudaconitine, which is the most deadly poison known. *Aconitum palmatum* yields another of the celebrated bikh poisons. The root of *Aconitum luridum*, of the Himalayas, is said to be as virulent as that of *A. ferox* or *A. napellus*. As garden plants the aconites are very ornamental, hardy perennials. They thrive well in any ordinary garden soil, and will grow beneath the shade of trees. They are easily propagated by divisions of the root or by seeds.

Chemistry.—The active principle of *Aconitum napellus* is the alkaloid aconitine, first examined by P. L. Geiger and Hesse (*Ann.*, 1834, 7, p. 267). Alder Wright and A. P. Luff obtained apoaconitine, aconine and benzoic acid by hydrolysis; while, in 1892, C. Ehrenberg and A. Purfürst (*Journ. Prat. Chem.*, 1892, 45, p. 604) observed acetic acid as a hydrolytic product. This, and allied alkaloids, have formed the subject of many investigations by Wyndham Dunstan and his pupils in England, and by Martin Freund and Paul Beck in Berlin. But their constitution is not yet solved, there even being some divergence of opinion as to their empirical formulae. Aconitine ($C_{38}H_{48}NO_{12}$, according to Dunstan; $C_{34}H_{47}NO_{11}$, according to Freund) is a crystalline base, soluble in alcohol, but very sparingly in water; its alcoholic solution is dextrorotatory, but its salts are laevorotatory. When heated it loses water and forms pyraconitine. Hydrolysis gives acetic acid and benzaconine, the chief constituent of the alkaloids picraconitine and napelline; further hydrolysis give aconine. Pseudaconitine, obtained from *Aconitum ferox*, gives on hydrolysis acetic acid and veratryl-pseudaconine, the latter of which suffers further hydrolysis to veratric acid and pseudaconine. Japaconitine, obtained from the Japanese aconites, known locally as "kuza-uzu," hydrolyses to japbenzaconine, which further breaks down to benzoic acid and japaconine. Other related alkaloids are lycaconitine and myoconine which occur in wolfsbane, *Aconitum lycoctonum*. The usual test for solutions of aconitine consists in slight acidulation with acetic acid and addition of potassium permanganate, which causes the formation of a red crystalline precipitate. In 1905, Dunstan and his collaborators discovered two new aconite alkaloids, indaconitine in "mohri" (*Aconitum chasmanthum*, Stapf), and bikhaconitine in "bikh" (*Aconitum spicatum*); he also proposes to classify these alkaloids according to whether they yield benzoic or veratric acid on hydrolysis (*Jour. Chem. Soc.*, 1905, 87, pp. 1620, 1650).

From the root of *Aconitum napellus* are prepared a liniment and a tincture. The dose of the latter (Brit. Pharmacop.) is of importance as being exceptionally small, for it is not advisable to give more than at most five drops at a time. The official preparation is an ointment which contains one part of the alkaloid

in fifty. It must be used with extreme care, and in small quantities, and it must not be used at all where cuts or cracks are present in the skin.

Pharmacology of Aconite and Aconitine.—Aconite first stimulates and later paralyzes the nerves of pain, touch and temperature, if applied to the skin, broken or unbroken, or to a mucous membrane, the initial tingling therefore gives place to a long-continued anaesthetic action. Taken internally aconite acts very notably on the circulation, the respiration and the nervous system. The pulse is slowed, the number of beats per minute being actually reduced, under considerable doses, to 40, or even 30, per minute. The blood-pressure synchronously falls, and the heart is arrested in diastole. Immediately before arrest the heart may beat much faster than normally, though with extreme irregularity, and in the lower animals the auricles may be observed occasionally to miss a beat, as in poisoning by veratrine and colchicum. The action of aconitine on the circulation is due to an initial stimulation of the cardio-inhibitory centre in the medulla oblongata (at the root of the vagus nerves), and later to a directly toxic influence on the nerve-ganglia and muscular fibres of the heart itself. The fall in blood-pressure is not due to any direct influence on the vessels. The respiration becomes slower owing to a paralytic action on the respiratory centre and, in warm-blooded animals, death is due to this action, the respiration being arrested before the action of the heart. Aconite further depresses the activity of all nerve-terminals, the sensory being affected before the motor. In small doses it therefore tends to relieve pain, if this be present. The activity of the spinal cord is similarly depressed. The pupil is at first contracted and afterwards dilated. The cerebrum is totally unaffected by aconite, consciousness and the intelligence remaining normal to the last. The antipyretic action which considerable doses of aconite display is not specific, but is the result of its influence on the circulation and respiration and of its slight diaphoretic action.

Therapeutics.—The indications for its employment are limited, but definite. It is of undoubted value as a local anodyne in sciatica and neuralgia, especially in ordinary facial or trigeminal neuralgia. The best method of application is by rubbing in a small quantity of the aconitine ointment until numbness is felt, but the costliness of this preparation causes the use of the aconite liniment to be commonly resorted to. This should be painted on the affected part with a camel's hair brush dipped in chloroform, which facilitates the absorption of the alkaloid. Aconite is indicated for internal administration whenever it is desirable to depress the action of the heart in the course of a fever. Formerly used in every fever, and even in the septic states that constantly followed surgical operation in the pre-Listerian epoch, aconite is now employed only in the earliest stage of the less serious fevers, such as acute tonsillitis, bronchitis and, notably, laryngitis. The extreme pain and rapid swelling of the vocal cords—with threatened obstruction to the respiration—that characterize acute laryngitis may often be relieved by the sedative action of this drug upon the circulation. In order to reduce the pulse to its normal rate in these cases, without at the same time lessening the power of the heart, the drug must be given in doses of about two minims of the tincture every half-hour and then every hour until the pulse falls to the normal rate. Thereafter the drug must be discontinued. It is probably never right to give aconite in doses much larger than that named. There is one condition of the heart itself in which aconite is sometimes useful. Whilst absolutely contra-indicated in all cases of valvular disease, it is of value in cases of cardiac hypertrophy with overaction. But the practitioner must be assured that neither valvular lesion nor degeneration of the myocardium is present.

Toxicology.—In a few minutes after the introduction of a poisonous dose of aconite, marked symptoms supervene. The initial signs of poisoning are referable to the alimentary canal. There is a sensation of burning, tingling and numbness in the mouth, and of burning in the abdomen. Death usually supervenes before a numbing effect on the intestine can be observed. After about an hour there is severe vomiting. Much motor weakness and cutaneous sensations similar to those above described

soon follow. The pulse and respiration steadily fail, death occurring from asphyxia. As in strychnine poisoning, the patient is conscious and clear-minded to the last. The only post-mortem signs are those of asphyxia. The treatment is to empty the stomach by tube or by a non-depressant emetic. The physiological antidotes are atropine and digitalin or strophanthin, which should be injected subcutaneously in maximal doses. Alcohol, strychnine and warmth must also be employed.

ACONITINE: see ACONITE.

ACONTIUS, in Greek legend, a beautiful youth of the island of Ceos. During the festival of Artemis, at Delos, Acontius saw and loved Cydippe, a well-born Athenian maiden. He wrote on an apple the words, "I swear to wed Acontius" and threw it at her feet. She picked it up, and mechanically read the words aloud, thus binding herself by an oath. Therefore, although she was betrothed more than once, she always fell ill before the wedding took place. The Delphic oracle at last explained the matter, and she married Acontius. (Callimachus, *Aitia*, III., 1 Mair; see his notes [p. 204 of the Loeb ed.] for other authorities.)

ACORN, the fruit of the oak-tree (see OAK); a word also used, by analogy with the shape, in nautical language, for a piece of wood keeping the vane on the mast-head.

ACORN SHELLS, a name often applied to the sessile forms of barnacles (*q.v.*) common on rocks, piers, etc., round the coasts. (See also CIRRIPEdia.)

ACORUS CALAMUS, sweet-sedge or sweet-flag, a plant of the family Araceae, which shares with the Cuckoo Pint (*Arum*) the representation in Britain of that family of Monocotyledons. The name is derived from *acorus*, Gr. *ἄκρος*, the classical name for the plant. It was the *Calamus aromaticus* of the mediaeval druggists and perhaps of the ancients, though the latter has been referred by some to the Citron grass, *Andropogon Nardus*. The spice "Calamus" or "Sweet-cane" of the Scriptures, one of the ingredients of the holy anointing oil of the Jews, was perhaps one of the fragrant species of *Andropogon*. The plant is a herbaceous perennial with a long, branched root-stock creeping through the mud, about $\frac{3}{4}$ inch thick, with short joints and large brownish leaf-scars. At the ends of the branches are tufts of flat, sword-like, sweet-scented leaves 3 or 4 ft. long and about an inch wide, closely arranged in two rows as in the true Flag (*Iris*); the tall flowering stems (scapes), which very much resemble the leaves, bear an apparently lateral, blunt, tapering spike of densely packed, very small flowers. A long leaf (spathe) borne immediately below the spike forms an apparent continuation of the scape, though really a lateral outgrowth from it, the spike of flowers being terminal. The plant has a wide distribution, growing in wet situations in the Himalayas, North America, Siberia and various parts of Europe, including England, and has been naturalized in Scotland and Ireland.

ACOSMISM. This term was coined by Fichte and Hegel on the model of the term atheism. According to the ordinary view, reality consists of God and a world (cosmos) of finite objects usually conceived as having been created by Him and made to conform to certain laws. Now atheism is the theory which denies the existence of God, and so identifies reality with a godless world of objects and events which exist of themselves and have an inherent order of their own. Acosmism is the contrary view that denies the independent reality of a world of finite objects and events, and regards God as the sole ultimate reality. In accordance with the common practice of denouncing anybody as an atheist whose conception of God was different from theirs, Spinoza was generally described as an atheist by his contemporaries and others. Hegel protested against the injustice of this. Spinoza, he said, was so far from denying the existence of God that he acknowledged no other ultimate reality—so far from being an atheist he was an acosmist. Fichte similarly applied the term to himself in reply to similar accusations. The term acosmism has since been applied also to philosophies like those of the Vedanta, of Buddhism, and of Schopenhauer. Apart from its polemical uses the term acosmism, with its suggestion of an illusory world, is not a happy equivalent of the term pantheism. Strictly speaking, a pantheism like that of Spinoza no more denies the reality of

the world than it denies the reality of God. It simply identifies the universe with God, and for that very reason regards the universe all the more as a world of order, a real *cosmos*. Moreover, there is an important sense in which pantheism is essentially *cosmic*, namely, in the sense that it regards man from the standpoint of the universe, instead of regarding the universe from the point of view of man (see ANTHROPOCENTRIC PHILOSOPHY). "Acosmism" is therefore not only an inadequate, but also a misleading description of pantheism.

ACOSTA, JOAQUIN (c. 1705–1852), Colombian historian and soldier, was an officer in Bolívar's army, and a member of Congress. He travelled in Colombia and in Spain, collecting material for his *Compendio histórico del descubrimiento y colonización de la Nueva Granada*, which was published in Paris in 1848.

ACOSTA, JOSÉ DE (1539?–1600), Spanish author, was born at Medina del Campo about the year 1539. He joined the Jesuits in 1551, and in 1571 was sent as a missionary to Peru; he acted as provincial of his Order from 1576 to 1581, was appointed theological adviser to the Council of Lima in 1582, and in 1583 published a catechism in Quichua and Aymara—the first book printed in Peru. In 1598 he became rector of the Jesuit college at Salamanca, where he died on Feb. 15, 1600. His treatise, *De natura novi orbis libri duo* (Salamanca, 1588–89), may be regarded as the preliminary draft of his celebrated *Historia natural y moral de las Indias* (Seville, 1590), which was speedily translated into Italian (1596), French (1597), Dutch (1598), German (1601), Latin (1602), and English (1604). The *Historia* is in three sections: books I. and II. deal with generalities; books III. and IV. with the physical geography and natural history of Mexico and Peru; books V., VI., and VII., with the religious and political institutions of the aborigines. Apart from his sophistical defence of Spanish colonial policy, de Acosta deserves high praise as an acute and diligent observer. Among his other publications is *De procuranda salute Indorum libri sex* (Salamanca, 1588).

BIBLIOGRAPHY.—Edward Grimston's translation of the *Historia* reprinted (1880) for the Hakluyt Society, with introduction and notes by Sir Clements R. Markham; C. Sommervogel, *Bibliothèque de la Compagnie de Jésus, Première Partie* (1890), vol. 1, col. 31–42; José R. Carricido, *El P. José de Acosta y su importancia en la literatura científica española* (1899).

ACOSTA, URIEL (d. 1647), Jewish author, was born at Oporto near the end of the 16th century. Educated in the Roman Catholic faith, he was received into the synagogue at Amsterdam and exchanged his baptismal name of Gabriel for Uriel. His wayward disposition, however, found no satisfaction in Judaism. He was twice excommunicated, and twice readmitted to the synagogue. In his autobiography, *Exemplar humanæ vitæ*, printed in 1687 and again in 1847, Acosta declared his hostility both to Christianity and Judaism, but spoke most bitterly of Judaism. He committed suicide in 1647. The story of Acosta's life provided K. F. Gutzkow with the material of the tragedy of *Uriel Acosta* (1847).

ACOUSTICS OF BUILDINGS, THE. The subject of the acoustics of auditoriums deals with the behaviour of sound in rooms and in halls, and the conditions which determine their fitness or unsuitability for the hearing of speech and music.

Certain characteristics of sounds emitted in a closed space require to be borne in mind. The sounds proceed outwards from the source in spherical waves until they strike the boundaries of the room. At the boundaries they are partly absorbed or transmitted to an extent depending upon the nature of the surfaces, but the remainder is reflected. Simple echoes may thus arise, and if any large portion of the surface is appropriately curved objectionable focussing of sound may occur. However, continuing the history of the reflected sound, it travels quickly, so that through numerous successive reflections its energy is very soon more or less uniformly diffused throughout the room, every element of volume being filled with waves proceeding in every direction. Again, since sound is a form of energy, when once produced in a confined space it will continue to exist until it is transmitted by the boundary walls or transformed into some other kind of energy, generally heat. Consequently if the boundaries are hard and non-absorbent, little energy is absorbed at each impact and, owing to

the very many reflections which occur before the sound dies away, prolonged reverberation is noticed. With more porous wall surfaces the aerial vibrations are damped out by frictional conversion into heat within the pores of the material, and reverberation is reduced. If the source of sound is continuously maintained the loudness in the room increases rapidly until the rate of emission of sound from the source is balanced by the absorption at the surfaces. In the steady state thus reached the loudness at a given point is generally greater than it would be in open air and, apart from echo and focussing effects, more uniform in distribution. It may be mentioned further that with sustained notes interference phenomena may be observed as the ear is moved from side to side, maxima and minima of sound being perceptible at different points. In the acoustics of buildings, however, these latter effects are of subsidiary importance, partly because the use of two ears tends to obscure them, and partly because in speech—and to a lesser extent in music—the sounds are changing so rapidly that an interference system is never completely set up. Finally, resonant vibrations of columns or volumes of air in the chamber may cause distortion of sounds of appropriate pitch, and sympathetic vibration of floors in contact with the source, or of panelling close at hand, will increase the volume of sound emitted.

The chief conditions for good hearing in an auditorium are therefore: (a) that loudness should be adequate; (b) that there should be no perceptible echoes or focussing; (c) that there should be no undue reverberation (*i.e.*, each speech sound should die away quickly enough to be inappreciable by the time the next is uttered); (d) that where best music is concerned the hall should be non-resonant and as uniformly reverberant as possible for sounds of all musical pitches, in order to preserve the proper relative proportions of the components of a complex sound; and (e) that the boundaries be sufficiently soundproof to exclude extraneous noise.

Loudness.—Voices of moderate strength and distinct pronunciation are usually loud enough to reach hearers in front of a speaker at a distance not exceeding about 50ft., provided the hearers have an uninterrupted view of the speaker. This limitation leads, in lecture halls, theatres and similar auditoriums where the hearing of speech is the primary consideration, to a size that will not usually accommodate more than about 2,000 persons, to the adoption of a raised platform or of raked seating so that a direct view of the speaker may be ensured, and to galleries for accommodating as many persons as possible within range of the voice.

Loudness is also enhanced by keeping the ceiling of a hall low so that it may act as a reflector to strengthen sounds reaching remote seats. This device is specially valuable for Council chambers in which members speak from where they stand, for no other surface can be equally effective for all positions of the speaker. In order that the audience in galleries may benefit from the reflection, the galleries should be under the main ceiling of the hall.

Electrical amplifying equipment, in conjunction with large loud-speakers, is now used successfully to increase the volume of sound, particularly in the case of speech. When this apparatus is used the assistance of other devices is not required. Amplification, however, must not be excessive, for excessive loudness gives undue prominence to low pitched sounds. It is necessary, therefore, to amplify only to an extent such that remote listeners can hear with comfort, to place the projectors well above the speaker's head, and so to direct them that the sound is not excessive for hearers near the platform. Loudness is then fairly uniform over the floor space and the majority of the audience has the impression of listening to only one source of sound—the speaker himself. Where a hall has a number of high galleries a double ring of projectors may be required above the speaker's head, one inclined downwards to the body of the hall, the other upwards to serve the galleries. Pl. I., fig. 1, showing two loud-speakers in position on the north side of the chancel of Liverpool cathedral, is an example of loud-speaker mounting in harmony with surroundings.

The question of loudness does not often arise in connection with orchestral and choral performances, and auditoriums for these pur-

2. Successive stages in the progress of a sound pulse within model outlines of an auditorium which has two types of galleries
3. Sound behaviour at the boundaries of a section of an auditorium analyzed geometrically and illustrated by water ripples
4. Rear portion of lecture hall of the Royal Institute of British Architects covered with shades of canvas for acoustic purposes

poses may be larger than those satisfactory for ordinary speech. It has been estimated by Heyl from considerations of loudness that the optimum volume of a concert hall increases from 50,000 cu.ft. for an orchestra of ten instruments to 800,000 cu.ft. for one of 90 instruments. For musical performances a wooden platform undoubtedly acts as a useful sounding board for instruments and performers in contact with it.

Echoes.—As a matter of general experience it appears that echoes are not noticeable when the time-interval between the arrival of the direct and reflected sounds is less than about one-fifteenth of a second or, in other words, when the path difference is less than 75 feet. According to Ernst Petzold, this time-interval should not exceed 0.05 second. In fact, it may be considered that reflected sounds arriving within this interval contribute usefully in raising the level of loudness, whereas those arriving later are undesirable and should be enfeebled as far as possible by absorption or scattering. Echo effects thus occur only in large auditoriums. They should be avoided in design, or minimized by applying absorbents to and breaking up the continuity of the surfaces which give rise to them.

For the prevention of echo it is desirable to avoid altogether ceilings of greater height than about 40 feet. Where this restriction is not acceptable, it is useful to coffer the ceiling deeply so that the echo may be scattered to some extent, and to apply highly absorbent materials in the panels. A less obvious expedient, but frequently an important one, is to apply absorbents to the upper parts of walls, and so to suppress sound which otherwise would be reflected upwards and returned to the floor of the auditorium later as an indirect echo. Frequently back walls should also be treated. In some cases, such as barrel vaulting of great height and pronounced curvature, a canopy of absorbent fabric hung near the focal region may have special value.

Echoes from high ceilings are largely eliminated when electrical amplifying equipment is used for increasing loudness, for the speech projectors are usually placed at least 25 ft. above floor level.

The general direction of likely echoes and the desirable situations for absorbents may usually be inferred from an inspection of sections of the chamber. For instance, on the assumption that sound obeys the laws of reflection of light, Pl. I., fig. 3, upper, is an analysis of sound reflection within the vertical longitudinal section of a council chamber. Floor reflections are omitted. On the scale adopted, it shows portions of a sound wave after travelling a total distance of 60 ft. from the black dot which represents a speaker on the floor of the chamber. For convenience arrows have been added to indicate the tracks of a number of the waves. In interpreting such drawings, however, it must always be borne in mind that, while for large surfaces sound tends to obey the ordinary laws of optical reflection, it usually spreads considerably beyond the limits applicable to light owing to its relatively greater wave-length.

Experimental methods of analysis have been developed in which observation is made of the progress of a sound pulse within a model or within model outlines of suitable sections of the building. This was first carried out by W. C. Sabine in America, using the technique of sound-pulse photography which had been developed by various physicists, particularly Toepler, Dvořák, Mach, Boys and Foley. The sound pulse is produced by means of an electric spark in a model section having open sides. As this pulse spreads in the model it is illuminated instantaneously by light from a distant electric spark. A silhouette of the model is thus cast upon a screen or photographic plate and, in addition, owing to refraction of light by the sound wave, the position of the sound pulse within the section is also shown. Sabine's own work contains many beautiful photographs relating to theatre acoustics. Fig. 3, middle, is a sound-pulse photograph taken in England at the National Physical Laboratory, relating to a section of a council chamber closely similar to that analyzed geometrically in fig. 3, upper, the floor being absent. General correspondence with fig. 3, upper, is marked, but the spreading of sound beyond optical limits is clearly brought out. Pl. I., fig. 2, due to A. H. Davis and N. Fleming of the Laboratory, is a series selected to show the earlier

and later progress of a sound pulse in a very similar section. The first of the series shows the outgoing wave proceeding equally in all directions from the source, and later photographs show the subsequent history of the wave after reflection from the boundaries. In particular, the third photograph shows that the main ceiling reflection reaches hearers in the right-hand gallery within less than $1/18$ th of a second after the passage of the original sound and is thus useful to them, while hearers in the left-hand gallery—which is in an alcove—are largely denied such enhancement of the sound.

In another method of study which is simpler in technique, use is made of the approximate similarity between sound waves and water waves. A model section of the building is laid flat in a tank of shallow water. Ripples are produced at a point corresponding to a speaker's position by dipping a small object in the water, and the reflection of ripples at the boundary illustrates the reflection of sound in the actual building. To facilitate study and photography of the ripples, the tank has a glass bottom and light from an arc lamp passes upwards through the glass bottom and casts a shadow of the model and of the waves upon a screen mounted above. Pl. I., fig. 3, lower, is a ripple photograph for the auditorium section already referred to in connection with the geometrical and the sound-pulse analyses.

When echoes are noticed in existing buildings they may be traced in suitable cases by ear. For the survey the hiss from an arc light placed at the focus of a reflector is a useful source of sound, first recommended by F. R. Watson. The reflections of the arc hiss may be traced by ear, but the beam of light accompanying the beam of sound reduces the labour of locating the place from which reflection is taking place.

Reverberation.—It is not sufficient, however, that there be adequate loudness in an auditorium and that foci and definite echoes be avoided. Indeed, the most prevalent defect encountered is excessive reverberation, sounds being reflected to and fro without sufficient weakening. It is most marked in large halls and arises from deficiency in the sound absorptive character of the surfaces.

It is frequently thought that defective acoustics in a hall can be cured by stretching wires to and fro near the ceiling. Whatever may be the value of such wires—and it is very doubtful whether they have any value at all—they do not reduce reverberation. There are instances where miles of wire have been employed, with no useful effect.

Neither is the introduction of electrical amplifying equipment a universal cure for excessive reverberation. Used with discrimination—say, in a case of reverberation due to a very high ceiling—it has a value which arises from the directive action of the loud-speakers and from the fact that, in projecting the sound downwards upon the audience-covered floor, the loud-speakers are directing it towards what is usually the most absorbent area in the auditorium. Apart from this directive action, however, the equipment does nothing to hasten the decay of sound which persists sufficiently to cause confusion. Indeed, in a highly reverberant hall this persistent sound affects the microphone and tends to cause the apparatus to emit a continuous note. However, the reverberant condition of a hall may be measured, controlled, and even predicted in advance of construction and arranged to conform with the condition generally approved.

For purposes of measurement the rate of decay of reverberation in a hall is expressed in terms of the time which elapses after the finish of a sustained note before the general intensity of sound in the room falls to inaudibility at one millionth of its initial value. This interval is called the reverberation period of the hall. It is a convenient practical period because a source of sound such as an organ pipe ordinarily gives rise to an intensity in a room of the order of a million times the minimum audible intensity. Moreover, it is a definite acoustical constant for a given condition of the room, for it has been found that the observed duration of reverberation is almost independent of the position of the source and of the observer and, for a given amount of absorbent in the room, is largely independent of its distribution.

In order to be able to calculate the reverberant condition of an auditorium in advance of construction, it is necessary to know the

factors which determine it. The theoretical basis of the subject, due largely to W. C. Sabine and G. Jaeger, is satisfactory and yields formulae which have been confirmed repeatedly by experiment. It is found that if V is the volume of a room, and if the surfaces, of total area S , absorb on an average a fraction "a" of the sound energy at each incidence, then the standard reverberation period T in which the reverberant sound decays one million-fold is given by

$$T = 0.05 \frac{V}{aS} \text{ in foot second units}$$

$$\text{or } T = 0.164 \frac{V}{aS} \text{ in metre second units.}$$

In the formulae the mean absorption coefficient "a" of the surfaces of the room is calculable from the absorption coefficients of the component parts. Thus if there are surfaces S_1, S_2, S_3 , etc., having respectively absorption coefficients a_1, a_2, a_3 , etc., then

$$aS = a_1 S_1 + a_2 S_2 + a_3 S_3 + \dots$$

From the formulae it is seen that reverberation may be decreased by reducing the volume of the room and by increasing the absorbing power of its surfaces.

Experiments made in a number of acceptable auditoriums in various countries by W. C. Sabine, F. R. Watson, S. Lifshitz and others, show that reverberation tends to have a preferred duration for good acoustics. For halls of moderate size, up to, say, 40,000 cu.ft., which are to be used both for speech and music, it is generally agreed that a standard period of about one second represents the optimum condition, the audience of course being present. For a hall five times as large, i.e., 200,000 cu.ft., the preferred period is apparently about $1\frac{1}{2}$ sec., and for very large halls of about 1,000,000 cu.ft. a period of 2 sec. is indicated. Presumably in very large halls the persistence of sound is tolerated for the sake of increased loudness, and speakers are expected to enunciate more slowly to accommodate themselves to the conditions.

Excessive reverberation is the more serious for speech, but insufficient reverberation is unacceptable for music. In fact, acceptable halls which are used for music alone appear to have reverberation periods some 25% greater than the values given above for halls of corresponding size used for mixed purposes. Moreover, for concert halls it has been found desirable to leave the region of the stage bare so as to give the feeling of easy response desired by the artistes and, if absorbent is required by hearers to deaden reverberation, it should be placed away from the stage so that both performers and hearers may regard the acoustics as satisfactory. Incidentally, any absorbing material introduced to reduce reverberation has also a value in damping out resonances in the air of the room and thus minimizing distortion that might arise from this cause.

Generally speaking, churches and cathedrals are characterized by long reverberation owing to great size and to the very slight absorbing power of the masonry walls. The condition may well be responsible for the development of the characteristic features of church choral music and intoned liturgy. Ordinary sermons, however, cannot be satisfactorily heard, and, in churches where reading and speaking are dominant factors of the service, the acoustic condition should obviously tend to conform to the optimum reverberant period already discussed.

In connection with the materials that may be used to control reverberation, the following table presents some useful average values for the absorbing power of unit areas of various types of absorbing surface. The values relate to the note (C^4 , 512 vibrations per second) near the middle of the musical scale, with which most reverberation measurements have been made. Almost invariably the absorbing power is less at lower frequencies, but differences at higher frequencies are not so consistent and, in general are not so marked.

It must of course be borne in mind that the absorption coefficient of a material will be dependent to some extent upon the manner in which the material is attached to the walls and that, owing to diffraction phenomena, somewhat abnormal values may be exhibited by isolated samples of which the dimensions are not great compared with the wave-length of sound.

The efficiency of a sound-absorbent material is usually due to the porosity of its surfaces, and the acoustic plasters referred to

TABLE OF ABSORPTION COEFFICIENTS
For frequency 512 vibrations per second

Material	Absorption coefficient (a)
<i>Walls, etc.</i>	
Brick, marble, glass, etc.	0.01-0.03 per unit area
Varnished wood	0.03-0.08
Wood panelling	0.1-0.2
Porous breeze concrete blocks	0.4
Fibre board panelling, ordinary	0.2-0.3
" " " thick, perforated	0.4-0.7
<i>Floors and floor coverings</i>	
Wood floor	0.03-0.08
Linoleum, rubber carpet	0.03-0.10
Carpet	0.15
" heavy, on felt	0.2-0.35
<i>Plasters and tiles</i>	
Ordinary plaster	0.03
Acoustic plasters and tiles	0.2-0.3
<i>Miscellaneous absorbents</i>	
Cretonne cloth	0.15
Curtains	0.2
" heavy, in folds	0.5-1.0
Oil paintings	0.28
Hair felt, 1" thick	0.5
Slag wool, wood wool, eelgrass, etc., 1" thick	0.55-0.8
Audience as ordinarily seated	0.96
Open window	1.0
<i>Individual objects</i>	
(For the case of individual objects the absorbing power per object is expressed below in terms of a square foot of complete absorption:—)	
Audience per person	4.7
Wood seats for auditoriums per seat	0.1-0.2
Upholstered seats for auditoriums per seat	1.2
Upholstered chairs per chair	3

in the table have an aerated texture arrived at during mixing either by mechanical frothing or by the addition of a gas generating ingredient. They give a pleasing finish for ceilings and for parts of wall surfaces where roughness is not objectionable. The acoustic tiles available are similar in appearance. Fibrous boards have also been developed for sound absorption; various soft materials such as clean hair felt, jute felt, eelgrass, fireproofed wood-wool, asbestos or slag wool may be applied in panels, behind a screen of canvas, net or rep. Plate I., fig. 4 is a photograph of the lecture hall of the Royal Institute of British Architects, which has been treated in this manner over the whole of the back wall and frieze, and in the spandrills of the central dome, the covering canvas being in special shades to match the decoration. The screen chosen should be as light as possible so that it does not reflect sound, but transmits it to the absorbent beneath, and is best unpainted. Paint yields a more sanitary surface, but when applied with a brush, the absorbing power of the panel is reduced by as much as 15 to 50% for one coat, with a further, but smaller, reduction for a second coat. Distemper sprayed over the screen is a usual form of decoration, but the membrane should not be previously sized. If undesirable reverberation in an auditorium is considered in advance of construction, space in the hall may be suppressed. To prevent the entrance of sound to a room, it is necessary to isolate against air-borne sound and structure-borne vibration.

Air-borne sound may be excluded by having walls and partitions sufficiently massive and rigid, and avoiding openings. Usually it is found that a rigid brick wall presents adequate obstruction to the entrance of aerial sounds. In very special cases double walls are erected, preferably on separate foundations, with an air space between them. Fillers of felt or slag wool, etc., do not add to the insulation in this case, but, by bridging the air space, slightly facilitate the conduction of vibration. Transmission of sound through partitions is mainly due to flexural vibration of the parti-

tion under the action of the incident sound, so that increasing the weight and the rigidity of a partition both improve the insulation. Generally speaking, the fundamental resonant frequency of masonry constructions—brick walls, hollow tile, lath and plaster—is quite low and, in consequence, for incident sounds of ordinary pitch it is the mass of these partitions which is the most important factor. In certain experiments by P. E. Sabine, the following average figures for resistance to aerial sound of various frequencies were found for this class of partition irrespective of the actual type of construction employed:

Weight of masonry partitions	Reduction in sound intensity
*45 lb. per sq. ft.	8,000-fold
30 " 	3,000 "
20 " 	1,000 "
10 " 	250 "

*This corresponds roughly to a $\frac{1}{2}$ -inch wall of medium brickwork.

To interpret these figures, it should be realized that the usual intensity of speech is about one million times the minimum audible intensity, and one-millionth of the intensity at which sound becomes painful. The total reduction for two completely separated walls would be equal to the product of their individual values, but, in practice, resonance of the air space and incomplete isolation of foundation result in lower figures. Some quantitative information has recently become available concerning various types of stud partitions but there is not yet unanimity among observers as to the absolute magnitude of the transmitter sound.

It is important that doors and windows be in the position most conducive to quietness, and that they shut completely so as to exclude the relatively considerable amount of sound that can enter through cracks. In door construction rigidity, as well as mass, is important. Frequently, for effective insulation, doors must be double, and in extreme cases even triple, separate frames are employed. In windows heavy plate-glass is best and small well-braced or leaded panes are rather better than large panes. Double windows are most effective when they are in separate insulated frames. Particular attention must also be paid to the ventilating arrangements, which may readily facilitate transmission of sound from room to room. It appears most satisfactory for the rooms to be supplied with ventilation ducts which communicate separately with a distant supply chamber, and it is advantageous to line the interior of the ducts and of the chamber with felt-like absorbent.

To isolate a room from structure-borne sounds, such as those arising from motors, lifts, hot-water pipes and attached machinery generally, it is necessary to break up the continuity of the solid conducting path. To this end layers of felt-like material are sometimes interposed in the path of the sound. It is essential, however, that where such insulation is employed no bolts, tie-pieces or other rigid members pass from structure to structure through the layer, unless thoroughly insulated by bushing and by using insulating washers under metal ones. The simplest place to introduce absorbent is frequently at the source. Motors and machinery may be insulated from the floor by substantial layers of materials such as cork, felt or rubber, or the special combinations of cork and felt, etc., obtainable commercially for the purpose. Alternatively, machinery may be mounted upon springy supports which are themselves insulated from the structure by suitable materials. Lift shafts should be insulated from the main structure and should be surrounded with corridors or stairs. Continuous metal pipes such as air pipes, hot water pipes, etc., may carry sound to considerable distances; they should, if possible, have insulating sections and should not pass through important partition walls.

Felt-like insulation may also be introduced into the actual structure of a building. For instance, a wall may be insulated from the floor upon which it stands by means of a layer of felt, and a further layer may be used to insulate it from the ceiling. In steel constructions insulating material can be employed as a bedding for foundations, columns, girders, cross beams, etc., to counteract the transmission of sound which would otherwise occur so readily.

In the complete insulation of rooms, therefore, it is generally

desirable for the boundaries of each room to be double, the inner shell with its separate door and window frames being insulated from the outer. One construction is to build the inner room upon a raft of steel framing, the raft being entirely insulated from the structural floor or girders by pads of insulation, and the walls of the inner room standing clear of the surrounding structure.

Finally, whether sounds originate within a room or are transmitted from outside, the loudness within depends upon the quantity of sound absorbent the room contains. The provision of soft carpets, of hangings and draperies, of upholstered furniture, and of specially absorbent plasters or materials for ceilings and walls, all tend to improvement, although in themselves they are not sufficient to obviate the necessity for the various special devices previously set out.

Kaye, *Acoustics of Buildings* (1927, bibl.); Ernst Petzold, *Elementare Raum Akustik* (1927). (A. H. D.)

ACQUI, city and episcopal see, province of Alessandria, Italy; from the town of that name it is 21m. S.S.W. by rail. Pop. (1921) 9,904 (town), 15,801 (commune). Its warm sulphur springs were already famous as Aquae Statiellae in Roman times. Part of the ancient bath establishment has been found; and south of the town are lofty arches of the aqueduct which supplied it. The place was connected by road with Alba Pompeia and Augusta Taurinorum. The town possesses a fine Gothic cathedral.

ACRANIATA, an obsolete term for a sub-phylum of the Chordata, including only *Amphioxus* (q.v.) and its allies.

ACRE. A harbour town or city of Palestine (Egypt. 'Ak (a), Assyr. *Akku*, Heb. *Akko*, Gr. *Ake* [Josephus, 'Arke], Lat. *Ac(c)e*; on Crusading coins *Ac(c)on*, Arab. 'Akka). From the 3rd century B.C. it was known as Ptolemais, perpetuating, perhaps the name of Ptolemy II. (Philadelphus). The name St. Jean d'Acre dates from the time when it was the headquarters of the Knights Hospitallers.

Topography.—Acre is situated on a low, rocky promontory at the northern end of the Bay of Acre. A strong wall, shot pitted, girds it to seaward, and to landward a double rampart. The ancient harbour has silted up leaving now only a few feet depth of water. In the roadstead there is good anchorage for small craft. To the south of the city, broadening as it advances, stretches the marshy malaria-stricken Plain of Acre. There enters the sea not far from the city the classic river Belus (Na 'mān) which of

ACRE IS 90M. FROM JERUSALEM AND WAS THE SCENE OF MANY BATTLES old provided, and still provides the *murex* from which the Phoenicians extracted the renowned Tyrian purple.

History.—Acre has had a most stirring and tragic history. Its strategic position on the military highway along the coast, its proximity to the western entrance to the Plain of Esdraelon, its significance as the natural port not only for Galilee, but for Damascus and the Hauran, coupled with the peculiar military value of its site, attached to it an enduring importance, both the political and commercial. The name first appears in the conquest lists of the Egyptian monarchs Thutmose III. (c. 1500 B.C.) and Seti I. (c. 1315 B.C.). From the Amarna dispatches of Amenhotep IV. (c. 1375 B.C.) it would appear that the caravans of Burra-Buriash II., king of Babylonia were plundered, much to his annoyance, by the king of Acre. In the Old Testament it is named (Judges i. 31) as one of the places whence the Israelites did not drive the Canaanite inhabitants. At the beginning of the 7th century B.C.

when the Assyrian was in the pride of his strength Acre appears to have been subordinate to Tyre for a time at least, since the two names are regularly coupled in inscriptions (Sinaherib, Asarhaddon). It is first mentioned apart in the records of Ashurbanipal (668-628). During the Persian period Acre is not much in evidence. It appears, however, to have been the rendezvous for Artaxerxes Mnemon in his expedition against Egypt (Strabo civ. 2). From this time on "for Egypt, for Asia Minor, for the Greek isles and mainland, and for Italy its harbour was the most convenient on the Syrian coast, and its history till the end of the New Testament period is that of the arrival of great men from these shores, of the muster of large armies, of the winter camps of the invaders of the Syrian hinterland, and of bitter conflicts between Greeks and Jews" (G.A. Smith). Josephus and the Books of the Maccabees record its varying fortunes. Within its walls the Syrian Greeks, routed by Simon Maccabaeus, sought refuge (164 B.C.). In the struggle for the Syrian throne, Alexander Balas wrested Acre from Demetrius (153). Jonathan was lured within its gate (Acre has only one) by Trypho and taken prisoner (143). Round about the year 104 B.C. Alexander Jannaeus laid siege to Acre but abandoned it from fear of Ptolemy Lathyrus, who besieged and took it, but was forced to yield it to his mother Cleopatra. Tigranes of Armenia stormed it (70 B.C.) but relinquished it under fear of the Romans and it surrendered without a struggle to the Parthian Pacorus (Josephus, *B.J.* i. 13). Herod entertained Caesar here and here he built a gymnasium. It was established a *colonia* by Claudius. St. Paul spent a day in Ptolemais while coasting from Tyre to Caesarea (Acts xxi. 7). In the wars with the Jews the Roman leaders realized its value as main base for their armies (Varus, Vitellius, Petronius, Cestius, Vespasian).

In Christian times Ptolemais became a bishopric and its bishop attended the great councils of the Church, Caesarea (198), Nicea (325), Constantinople (381), Chalcedon (451), Jerusalem (536). The Arabs took possession of the city in 638. Baldwin I. captured it with the aid of a Genoese fleet in 1104 (1st crusade). Saladin re-captured it in 1187 (2nd crusade). In 1191 after a siege by Guy de Lusignan of about two years, it was taken on the arrival of Richard Coeur de Lion (3rd crusade), and was finally lost by them in 1291. The Turks under Salim I. entered into possession in 1517, after which the city fell into decay. Its revival began in 1749 with its capture by Omar ez-Zahir, and it emerged into prominence, prosperity and virtual independence under his successor "Ahmad el-Jezzar" ("the butcher"). Supported by a British fleet under Sir Sidney Smith it resisted successfully Napoleon in 1799. The year 1832 saw its capture and wreck by Ibrahim Pasha of Egypt. On Nov. 4, 1840, the city was attacked by the allied fleets (British, Austrian, Turkish) under Sir Charles Napier and after three hours' bombardment reduced. Restored in the following year to Turkey it remained in Turkish hands till Sept. 23, 1918, when it was occupied by the 13th Cavalry Brigade (5th Cavalry Division) of the Egyptian Expeditionary Force with little or no opposition.

Modern.—Acre with a population of 6,500 (about 5,000 Muslims) is in British mandated territory and under the existing administrative partition of Palestine in the northern Province (Phoenicia and Galilee). Under Turkish rule it was the chief town of a governmental district. Formerly the chief port of shipment for grain brought on camel-back from the Hauran, its trade was much diminished with the opening of the Damascus-Beirut railway in 1896 and practically extinguished when the Haifa-Damascus railway in 1906 diverted what remained to Haifa. It has now a small coasting trade in locally grown grain, sesame seed and oil and a small export of oranges to Beirut. Brass and copper ware are made to a small extent. It is now a customs sub. station to Haifa. Acre is the chief seat of Baha'i religion, an offshoot of Babism, with an estimated number of adherents at 2 millions. The founder 'Abdu-l Baha died here in 1921 and was succeeded by his grandson Shauki Effendi, who has been made Life-president of the council of Nine, which regulates the affairs of the community. Few buildings of interest have survived the buffetings to which the city has been repeatedly subjected. The most no-

table, perhaps, is the large mosque built by El-Jezzar. Four commodious khans recall the times when 2,000 to 3,000 camels, grain laden, would arrive in a day. British administration has been responsible for the establishment of a government hospital, a forest nursery, and a large convict prison. A railway from Beirut along the coast to Acre is projected by the French.

Battle of Acre.—The battle of 1189, fought on the ground to the east of Acre, affords a good example of battles of the Crusades. Saladin's victory at Tiberias in 1187 had led to the fall of Jerusalem and to that of almost all the Christian strongholds in Palestine and Syria, save Tyre, Antioch, and Tripoli. The attempt to regain Acre led to the battle described below and was in turn a prelude to the Third Crusade under Richard I. of England and Philip of France. The crusading army under Guy de Lusignan, king of Jerusalem, which was besieging Acre, gave battle on Oct. 4, 1189, to the relieving army raised by Saladin. The Saracens lay in a semicircle east of the town, facing inwards towards Acre. The Christians opposed them with crossbowmen in first line and the heavy cavalry in second. At Arsuf (*q.v.*) the Christians fought coherently; here the battle began with a disjointed combat between the Templars and Saladin's right wing. The crusaders were so far successful that the enemy had to send up reinforcements from other parts of the field. Thus the steady advance of the Christian centre against Saladin's own corps, in which the crossbows prepared the way for the charge of the men-at-arms, met with no great resistance. But the victors scattered to plunder. Saladin rallied his men and, when the Christians began to retire with their booty, let loose his light horse upon them. No connected resistance was offered, and the Turks slaughtered the fugitives until checked by the fresh troops of the Christian right wing. Into this fight Guy's reserve, charged with holding back the Saracens in Acre, was also drawn, and, thus freed, 5,000 men sallied out from the town to the northward; uniting with the Saracen right wing, they fell upon the Templars, who suffered severely in their retreat. In the end the crusaders repulsed the relieving army, but only at the cost of 7,000 men.

See Oman., *Hist. of the Art of War in the Middle Ages*, vol. 1. 333-340 (1924).

ACRÉ or AQUIRY, a river of Brazil and principal tributary of the Purús, rising on the Bolivian frontier and flowing easterly and northerly to a junction with the Purús at 8° 45' S. The name is also applied to a district situated on the same river and on the former (1867) boundary line between Bolivia and Brazil. The region, which abounds in valuable rubber forests, was settled by Bolivians between 1870 and 1878, but was invaded by Brazilian rubber collectors during the next decade and became tributary to the rubber markets of Manáos and Pará. In 1899 the Bolivian Government established a customhouse at Puerto Alonso, on the Acré river, for the collection of export duties on rubber, which precipitated a conflict with the Brazilian settlers and finally brought about a boundary dispute between the two republics. In July 1899, the Acréanos declared their independence and set up a republic of their own, but in the following March they were reduced to submission by Brazil. Various disorders followed until Brazil decided to occupy Puerto Alonso with a military force. The boundary dispute was finally settled at Petropolis on Nov. 13, 1903, through the purchase by Brazil of the rubber-producing territory south to about the 11th parallel, estimated at more than 60,000 sq.m.

ACRE, a land measure used by English-speaking races. Derived from the O.E. *acer* and cognate with the Lat. *ager*, Gr. *áγρος*, Sans. *ajras*, it has retained its original meaning "open country," in such phrases as "God's acre," a churchyard, or "broad acres," etc. As a measure of land, it was first defined as the amount a yoke of oxen could plow in a day; statutory values were enacted in England by acts of Edward I. and III., Henry VIII., George IV.; the Weights and Measures Act 1878 defines it as 4,840sq.yds. This is the American acre. In addition to this

THE NAME GIVEN TO THE CITADEL IN CITIES OF GREECE AND ASIA MINOR WAS ACROPOLIS. IT WAS GENERALLY BUILT UPON A HILL OR ROCK, WAS FORTIFIED AND COMMANDED THE CITY AND SURROUNDING TERRITORY. THE ACROPOLIS CONTAINED IMPORTANT BUILDINGS, IN ATHENS THE WEIGHTS CONNECTED WITH THE COINAGE WERE KEPT IN THE ACROPOLIS

"statute" or "imperial acre," other "acres" are still, though rarely, used in Scotland, Ireland, Wales and certain English counties. The Scottish acre contains 6,150.4sq.yds.; the Irish acre 7,840sq.yds.; in Wales, the land measures *erw* (4,320sq.yds.) *stang* (3,240 sq.yds.) and *paladr* are called "acres"; the Leicestershire acre (2,308 $\frac{1}{2}$ sq.yds.), Westmorland acre (6,760sq.yds.) and Cheshire acre (10,240sq.yds.) are examples of local values.

ACRIDINE is a solid, crystallizing in needles of melting point 110° C, found in coal-tar anthracene. It is characterized by its irritating action on the skin, and by the blue fluorescence shown by solutions of its salts. It is extracted from the crude anthracene by dilute sulphuric acid; the sulphuric acid solution is treated with potassium dichromate, and the precipitate of sparingly soluble acridine dichromate is decomposed with ammonia (C. Graebe and H. Caro, *Ann.* 1871).

Acridine and its homologues are stable compounds of feebly basic character, belonging to the general class of heterocyclic ring compounds (*see* CHEMISTRY: *Organic*). They combine readily with the alkyl iodides to form alkylacridinium iodides, which are readily transformed by the action of alkaline potassium ferricyanide to N-alkylacridones.

Acridine itself has the structural formula

It owes its basic properties to the presence of the tertiary nitrogen atom; it may be regarded as consisting of two benzene nuclei fused to a partially reduced pyridine nucleus, and shows characteristics both of the former (homocyclic) and the latter (heterocyclic) structure.

Phenyl-acridine is the parent base of chrysaniilpe, the chief constituent of the dyestuff phosphine (a by-product in the manufacture of rosaniline). The dyestuff phosphine must be distinguished from the phosphorus hydride of the same name, and from the organic derivatives of this substance, to which the general term phosphine is also given. Chrysanaline (diamino-phenylacridine) forms red salts, dyeing silk and wool a fine yellow; the solutions of the salts are characterized by their fine yellowish-green fluorescence.

Several acridine derivatives and notably acriflavine (*syn.* tryphaflavine, euflavine) found extensive use during the World War as antiseptics for infected wounds (C. H. Browning and others). The preparation of acriflavine (I.) and of proflavine, another acridine antiseptic of similar type, was described by L. Benda (1912).

Rivanol (II.) also of the acridine series is recommended by J. Morgenroth (1921) as a powerful tissue antiseptic against spreading infection due to streptococcus.

ACRIFLAVINE, a coal tar derivative, in the form of a reddish-brown crystalline powder, possessed of antiseptic properties. Weak solutions are pale lemon-yellow and should be freshly made. A modification, known as neutral acriflavine, has now almost supplanted the older drug, as it is less irritant and can be used in stronger solutions. Its singular advantage over other antiseptics is that it is particularly effective in the presence of serum, as in wounds. Its high cost, as compared with other local antiseptics, limits its use. It is commonly employed in solutions of $\frac{1}{1,000}$ to $\frac{1}{5,000}$ as a wash or dressing in fresh wounds and infected wounds; in cases of gonorrhoea, by instillation; and in disinfection of the skin before operation. Under certain conditions and for certain bacteria it is more effective than tincture of iodine or mercurochrome.

ACRO or **ACRON**, **HELENIUS**, Roman grammarian, probably flourished at the end of the 2nd century A.D. He wrote commentaries on Terence and perhaps Persius. A collection of

scholia on Horace was wrongly attributed to him.

See Pseudoacronis Scholia in Horatium Vetustiora, ed. O. Keller.

ACROLITHS, statues of a transition period in the history of plastic art, in which the trunk of the figure was of wood, and the head, hands and feet of marble. The wood was concealed either by gilding or, more commonly, by drapery, and the marble parts alone were exposed.

ACROMEGALY, the name given to a disease characterized by a true hypertrophy (an overgrowth involving both bony and soft parts) of the terminal parts of the body, especially of the face and extremities. It occurs in both sexes, usually between the ages of 25 and 40. Its causation is associated with morbid changes in the pituitary gland, and an extract of this body has been tried in the treatment, as one of the recent developments in organo-therapeutics; thyroid extract has also been used, but without marked success, on the apparent analogy of acromegaly with myxoedema. (*See* ENDOCRINOLOGY.)

ACRON, a Greek physician of the 5th century B.C., born at Agrigentum in Sicily, was contemporary with Empedocles. The method of lighting large fires and purifying the air with perfumes, to put a stop to the plague in Athens (430 B.C.), is said to have originated with him.

ACROPOLIS, literally the upper part of a town (Gr. *ἄκρος* top, *πόλις* city). For purposes of defence early settlers chose elevated ground, frequently a hill with precipitous sides, and these early citadels became in many parts of the world the nuclei of large cities which grew up on the surrounding lower ground. The word Acropolis, though associated primarily with Greek towns (Athens, Argos, Thebes, Corinth), is applied to all such citadels. The most famous is that of Athens, which, by reason of its historical associations and the famous buildings erected upon it, is generally known as the Acropolis (*see* ATHENS).

ACROPOLITA (AKROPOLITES), GEORGE (1217-82), Byzantine historian and statesman, was born at Constantinople. At an early age he was sent to the court of John Ducas Batatzes (Vatatzes), emperor of Nicaea, by whom and by his successors (Theodorus II. Lascaris and Michael VIII. Palaeologus) he was entrusted with important state missions. The office of "great logothete" or chancellor was bestowed upon him in 1244. Acropolita's most important political task was that of effecting a reconciliation between the Greek and Latin Churches. In 1273 he was sent to Pope Gregory X., and at the Council of Lyons (1274) in the emperor's name he recognized the spiritual supremacy of Rome. In 1282 he was sent on an embassy to John II., emperor of Trebizond, and died in the same year.

His historical work (*Ἱστορικὴ Συγγραφή, Annales*) embraces the period from the capture of Constantinople by the Latins (1204) to its recovery by Michael Palaeologus (1261), thus forming a continuation of the work of Nicetas Acominatus. It is valuable as written by a contemporary, whose official position gave him access to trustworthy information. He wrote several shorter works, among them being a funeral oration on John Batatzes, an epitaph on his wife Eirene and a panegyric of Theodorus II. Lascaris of Nicaea. While a prisoner at Epirus he wrote two treatises on the procession of the Holy Ghost.

Bekker (1836), and Migne, *Patrologia Graeca*, cxi.; in the Teubner series by A. Heisenberg (1903), vol. ii. of which contains a full life, with bibliography; *see also* C. Krumbacher, *Geschichte der byzantinischen Literatur* (1897).

ACROSTIC, a short verse composition, so constructed that the initial letters of the lines, taken consecutively, form words (Gr. *ἄκρος*, at the end, and *στιχός*, line or verse). The fancy for writing acrostics is of great antiquity, having been common among the Greeks of the Alexandrine period, as well as with the Latin writers since Ennius and Plautus, many of the arguments of whose plays were written with acrostics on their respective titles. One of the most remarkable acrostics was contained in the verses cited by Lactantius and Eusebius in the 4th century, and attributed to the Erythraean sibyl, the initial letters of which form the words *Ἰησοῦς Χριστὸς Θεοῦ υἱὸς σωτὴρ* "Jesus Christ, the son of

God, the Saviour." The initials of the shorter form of this again make up the word *ἰχθῦς* (fish), to which a mystical meaning has been attached (Augustine, *De Civitate Dei*, 18, 23), thus constituting another kind of acrostic.

Acrostic verses have always been held in slight estimation from a literary standpoint. Dr. Samuel Butler says, in his "Character of a Small Poet," "He uses to lay the outside of his verses even, like a bricklayer, by a line of rhyme and acrostic, and fill the middle with rubbish." Addison (*Spectator*, No. 60) found it impossible to decide whether the inventor of the anagram or the acrostic were the greater block-head; and, in describing the latter, says, "I have seen some of them where the verses have not only been edged by a name at each extremity, but have the same name running down like a seam through the middle of the poem." And Dryden, in *Mac Flecknoe*, scornfully assigned Shadwell the rule of

Some peaceful province in acrostic land.

The name acrostic is also applied to alphabetical or "abecedarian" verses. Of these we have instances in the Hebrew psalms (e.g., Ps. xxv. and xxxiv.), where successive verses begin with the letters of the alphabet in their order. The structure of Ps. cxix. is still more elaborate, each of the verses of each of the 22 parts commencing with the letter which stands at the head of the part in our English translation.

At one period much religious verse was written in a form imitative of this alphabetical method, possibly as an aid to the memory. The term acrostic is also applied to the formation of words, from the initial letters of other words. *ἰχθῦς*, referred to above, is an illustration of this. So also is the word "Cabal," which, though it was in use before, with a similar meaning, has, from the time of Charles II., been associated with a particular ministry, from the accident of its being composed of Clifford, Ashley, Buckingham, Arlington, and Lauderdale.

Double acrostics are such as are so constructed, that not only initial letters of the lines, but also the middle or last letters, form words. For example:—1. By Apollo was my first made. 2. A shoemaker's tool. 3. An Italian patriot. 4. A tropical fruit. The initials and finals, read downwards, give the name of a writer and his *nom de plume*. Answer *Lamb, Elia*.

1. L yr E
2. A w L
3. M azzin I
4. B anan A

A curious and clever 20th-century development of the acrostic is the quadruple acrostic. The following, taken from R. A. Knox's *Book of Acrostics*, is a good example.

Uprights: Since there's no A, B, let us C and D.

Lights: 1. Reverse the name a schoolboy might apply, for brevity, to his weekly subsidy.

2. A lady thus (but with an S)
In Southern lands you might address.

Acrostics may be very simple and also very intricate. The modern acrostic seems to hit the happy medium and, whilst giving the reader plenty of food for thought, sends him occasionally to his Cruden, his classical dictionary or his encyclopaedia.

BIBLIOGRAPHY.—P. M. Pearson, *Acrostic Dictionary* (1901); R. A. Knox, *Book of Acrostics* (1924); L. C. Scott, *Acrostic Poems* (Iowa, 1924).

FROM BÜHLMANN, "CLASSIC AND RENAISSANCE ARCHITECTURE," NEFF AND HELBURN

TWO GREEK ACROTERIA
Top and lower right, front and back of apex type. (From Fletcher, "Hist. of Arch.," Batsford.) Lower left, eaves type

ACROTERIUM or **AKROTERION**, in architecture, a statue or ornament of any kind placed on the apex or at the lower angles of a pediment. The word is sometimes restricted to the pedestal supporting such an ornament.

ACT, a word varying in significance according to the sense in which it is employed. It is often synonymous with "statute" (*see ACT OF PARLIAMENT*). It may also refer to the result of the vote or deliberation of any legislature, the decision of a court of justice or magistrate, in which sense records, decrees, sentences, reports, certificates, etc., are called *acts*. In law act means any instrument in writing, which declares or proves the truth of a bargain or transaction, as: "I deliver this as my act and deed." The origin of the legal use of the word "act" is in the *acta* of the Roman magistrates or people, of their courts of law, or of the senate, meaning (1) what was done before the magistrates, the people or the senate; (2) the records of such public proceedings. In the sense of "document" it is used in those systems of law which are derived from the Roman.

ACTA DIURNA, called also *Acta Populi*, *Acta Publica* and simply *Acta* or *Diurna*, in imperial Rome a sort of daily gazette, containing an official narrative of noteworthy events at Rome. Its contents were partly official (court news, decrees, etc.), partly private (notices of births, etc.). Thus to some extent it filled the place of the modern newspaper (q.v.). The *Acta* were originated by Julius Caesar, who ordered the keeping and publishing of the acts of the people by public officers. The *Acta* were exposed daily in a public place on a whitened board (*see ALBUM*). After remain-

ing there for a reasonable time they were taken down and preserved with other public documents, so that they might be available for reference.

The *Acta* differed from the *Annals* (discontinued in 133 B.C.) in that only the more important matters were given in the latter, while in the former things of less note were recorded. Their publication continued till the transference of the seat of the empire to Constantinople.

See Gaston Boissier, *Tacitus and other Roman Studies* (Eng. trans. W. G. Hutchison, 1906), p. 197-229.

AFTER A CAST IN METROPOLITAN MUSEUM OF ART
ACTAEON. MYTHICAL HERO AND HUNTER, KILLED BY HIS HOUNDS FOR HAVING ACCIDENTALLY SEEN DIANA (ARTEMIS) WHILE BATHING

statue was often set up on rocks and mountains as a protection against excessive heat, and the myth itself probably represents the destruction of vegetation during the 50 dog-days. Aeschylus and other tragic poets and artists made use of the story, which is illustrated by a noted small marble group in the British Museum.

ACTA SANCTORUM, a collection of the lives of the saints, arranged day by day according to the calendar, and compiled by the Bollandists, Belgian Jesuits. The work, first conceived at the commencement of the 17th century, has been carried on ever since, save during the period of the suppression of the Society of Jesus in Belgium. In 1925 the fourth volume for November, dealing with the days Nov. 9 and Nov. 10, was published. (*See BOLLANDISTS*.)

ACTA SENATUS or **COMMENTARIJ SENATUS**, minutes of the discussions of the Roman senate. Before the first consulship of Julius Caesar (59 B.C.), minutes of the proceedings of the senate were occasionally published, unofficially; Caesar, however, ordered them to be issued authoritatively. The keeping

of them was continued by Augustus, but their publication was forbidden. A young senator was chosen to draw up these *Acta*, which were kept in the imperial archives and public libraries. Special permission from the city praefect was necessary in order to examine them. (*See ACTA DIURNA.*)

ACTING. Greek drama is usually given first consideration in connection with the origin of dramatic art, but the basic reasons for imitation, mimicry and what is now called "acting" are found in the study of the lower races of man. Make-believe, or the desire to imitate, is, perhaps, most common among children the world over, and it appears also among many animals.

Havemeyer points out (*The Drama of Savage Peoples*) that "there is a twofold purpose in this imitation characteristic of savage peoples. The first and simplest is that it gives a pleasurable sensation similar to the real experience. And, secondly, it enables man to convey his impressions to others—i.e., it is a form of language." From the last purpose grew the gesture, or any bodily gesticulation or facial expression that serves as an aid to, or a substitute for, the spoken language of the savage. It was a common means of communication.

Development.—The evolution of acting, from its simple beginnings to modern times, is summed up by Brander Matthews (*The Development of the Drama*) "The dramaturgic faculty is evolved slowly with the growth of civilization; and play-making skill is one of the latest of human accomplishments. But the rudimentary is everywhere visible, even among the most primitive peoples. As we consider the history of human progress, we perceive that the drama is almost the very earliest of the arts, as early, perhaps, as the art of personal adornment; and we discover also that it is the very latest to attain its complete expression. But in the noblest work of the Greek dramatists, and in the most powerful plays of the Elizabethans, the same principles are applied which we discover, doubtlessly, in the rudest theatrical attempts of the lowest savages. It is out of the crude efforts, such as still may be observed among the Eskimo and the tribes of the Amazon, that the dramatic art was toilfully developed by our own predecessors as taste refined and civilization advanced. The traditions of these rude play-makers were passed down from generation to generation, and the art slowly discovered itself."

Grecian Influences.—It was not until the gods of Egypt were accepted by the Greeks that there appears any ceremony which can be truly called dramatic. The Greek drama arose through the worship of the gods of vegetation, and later developed into the form of the plays of the great dramatists. It is difficult, however, to think of the drama of the Greeks without thinking of its close connection with the dance. The myth was the subject-matter; the dance was the expression of that subject-matter, be it the idea of spring, the awakening of new life, or the representation of various objects such as trees and events by means of gestures, postures and attitudes. In the early religious history of Greece all the people took a part in the dramatic dances around the altar, but later, a certain few of the most capable actors were selected from the chorus to play outstanding rôles, or to play many, and sometimes all, of the parts in the play—inasmuch as the custom of wearing masks made this possible. The number of principal actors in a Greek play seldom exceeded three, and it was more common to have only one character appear at a time. Thus it was that acting became a profession, and, among the Greeks, a very noble one. The profession was confined entirely to men.

Eastern Customs.—It is interesting to note, in the above connection, that in Japan men and women were forbidden on the same stage. Now and then women played parts, but never on the same stage with men, and, more often, men who had spent their lives from childhood in feminine costume and society in order to "obliterate every masculine proclivity" played the women parts. Here, too, the players never appear without masks. In the No plays or dances of Japan the action is very restrained, and though the movements do, to some extent, express the story, the performers seldom alter their positions upon the stage. (*See NO DRAMA.*) The Japanese actor must make his acting conducive to the imagination of the audience. Since there are no stage proper-

ties of any kind, no scenery, the images of the places in which the action lies must be created entirely upon the minds of the audience by the descriptive passages of the play, which are largely poetic.

Italian Interests.—In Italy the dramatic instinct has been very pronounced among its people as far back as records show. The dramatic literature of Italy has emerged from centuries of political and religious strife, but through all these troubled days the genius of the Italian people has led it to love the drama, and more—the art of acting. Before the writing of plays, and even after, as in the *Commedia dell'arte*, it has not been uncommon for a group of people to dramatize impromptu. Given a theme on which to bring out some feeling or desire, they express this spontaneously in the form of a play. The love of music, dance and spectacle did more, perhaps, to preserve this interest in the dramatic art through the political and religious struggles—the periods that provided no dramatic literature—than any other influence.

The Elizabethan Drama.—The art of acting was emphasized more by Shakespeare than by any other dramatist of his day. His plays show a remarkable interest in characterization, in which he brought forth every known type of humanity that would fit into the tragic or comic rôles that he created. And Shakespeare's own convictions as to the importance of acting, shown in Hamlet's speech to his players, cannot be over-estimated, for here he incorporates the fundamentals of good acting, the important factors in the better use of the voice and body:

"Speak the speech, I pray you, as I pronounced it to you, trippingly on the tongue; but if you mouth it, as many of your players do, I had as lief the town-crier spoke my lines. Nor do not saw the air too much with your hands, thus; but use all gently; for in the very torrent, tempest, and, as I may say, whirlwind of your passion, you must acquire and beget a temperance that may give it smoothness. Oh, it offends me to the soul to hear a robustious, periwig-pated fellow tear a passion to tatters, to very rags, to split the ears of the groundlings who, for the most part, are capable of nothing but inexplicable dumb-show and noise; I would have such a fellow whipped for o'erdoing Termagant; it out-Herods Herod; pray you, avoid it."

"Be not too tame, neither, but let your own discretion be your tutor; suit the action to the word, the word to the action . . ."

Views of Diderot.—It was not until about the 18th century that the different theories, or definite systems, of acting began to appear to any extent. Denis Diderot, the French encyclopaedist, grew weary of the classical French drama, with its conventional acting, and advanced as its opposite the theory of a drama of real life, which was, among other things, to be a truer reflection of the bourgeois of France. Diderot said (*Paradoxe sur le comédien*) that "The possibilities of a good actor lie in the complete absence of sensibility," and recommended to the actor that he should watch himself during the performance, that he should listen to his voice, and give only "recollections of his emotions."

Theodore Komisarjevsky, formerly producer and art director of the Moscow State and Imperial theatre, wrote of this theory: "It is proved now that an actor cannot move the audience, or be in any way creative on the stage, if he watches himself acting. Instead of being concentrated on the images he has to create, on his inner self, he becomes concentrated on his outer self, becomes self-conscious and loses the power of imagination. The better way is to act only with the help of the imagination; to create, and not to imitate or reproduce one's own life experiences. When the actor playing a part is living in a world of images created by his own phantasy, he cannot and need not watch and control himself. The images created by the actor's phantasy, and obedient to his call, control, guide and direct his emotions and actions during the performance."

MODERN TENDENCIES

The 20th century has seen several new and distinct theories of acting. Different schools, academies of acting and theatres, mostly repertory, have done a great deal towards improving the

standard of acting and team work or ensemble acting, on the stage. Of such are, in England, the Repertory theatre in Birmingham, and the Liverpool Repertory theatre; in Ireland the Abbey theatre, Dublin. Such English producers as Gordon Craig, Granville Barker, Basil Dean, J. B. Fagan, Lewis Casson, Nigel Playfair, have done very important work in improving the quality of acting, and creating stage ensembles, not only directly by their stage work, but also by their writings on the subject. In the United States, David Belasco, the Theatre Guild of New York, the Washington Square Players, the Provincetown Playhouse and such producers as Hopkins, R. E. Jones, the Reichzts and others contributed to this improvement. Moreover, the Little Theatre movement (*q.v.*) in America must not be overlooked.

In reviewing the general style of acting during this period, it will be noticed that everywhere on the stages of the theatres where there is no leading producer who has a definite theory or system of acting, and who trains his company without having a definite system or theory, there is a mixture, not only of modern, but of very many different styles of acting. In the so-called commercial theatre, with star actors, the typical style of acting is generally not an art of creation of imaginary characters, but a kind of repetition of themselves by the actors in every part and in every play. These stars are not really acting, but merely showing themselves off to the public, using their personality and certain peculiarities of that personality, and trying to please and to obtain the sympathy of the audience.

Producers such as Max Reinhardt in Germany and Firmin Gémier in Paris use, for the most part, the methods of acting created by the naturalists, André Antoine in France, and Kroneg, the producer of the German Meininger Company and developed by Otto Brahm in Berlin and by Stanislavsky in Moscow. Sometimes these producers introduce, in this naturalistic acting, ideas of the formalists, Georg Fuchs in Germany, Meyerhold and Tairof in Russia, Gordon Craig in England and others. Sometimes they introduce touches of the synthetic theories of acting advocated by Komisarjevsky since 1910. The majority of the French actors trained in the Conservatoire in Paris remain still under the influence, not only of the old romantic school, but also of the pseudo-classical school of acting of the 18th century.

Naturalism.—The best known of all the new theories of acting which have appeared since 1910 is the system of Stanislavsky, the leading producer and director of the Moscow Art theatre. His system is founded on the principle that an actor, having to be natural and sincere on the stage, could be so only by means of reproducing emotions experienced at some time or other in his life. That form of "psychical naturalism" became part of Stanislavsky's system as a result of "outer naturalism," which he advocated before he turned to psychology in the endeavour to find out a scientific system of acting.

The "inner naturalism" in acting is not a new feature in Stanislavsky's theory. Some French theatrical theorists had already, in the 18th century, founded their systems of acting on the same ideas. They held that an actor can represent himself on the stage only if it is desired that he should be sincere; that "love scenes are much better played by actors who are in love in real life." Like the followers of Racine, Stanislavsky believes that contemporary actors living in their own time, and each one in his special atmosphere, are unable to produce other emotions than those that are applicable to the time and to the surroundings in which they lead their every-day life. To be sincere, they must place, beneath the lines and stage directions of the author, their own emotions already experienced in real life.

It is quite clear that this type of acting destroys the form created by the author of the play and the rhythm of his lines, which express the inner content and the inner movements of the play. The actor who acts by the power of his imagination passes from the form and the rhythm of the play to the inner content of it. The idealistic and emotional content of the play, which he obtains through the form and rhythm of the play, exists in his imagination, and produces the necessary working of his intellect to create a stage character with all its peculiarities. The pupil of Stanislavsky neglects the form and rhythm of the play and

substitutes his own remembered, intellectual states in place of those of the author.

The Formalists.—Another system, opposed to Stanislavsky's ideas, has been advocated by the symbolists, the formalists and the expressionists. Here we have a complete negation of sincerity and life-likeness; the less the acting is sincere and life-like the better. The actor must not try to create any definite characters; he must represent abstract ideas, and convey these through his speeches delivered in a formal way, and through his movements and gestures, again produced in a formal, unlife-like and "pictorial" or marionette-like style. The Russian and German formalists, Meyerhold, Tairof and Piscator, after the Revolution, became much interested in acrobatics and circus business; the movements of the actors in their productions became something akin to a *perpetuum mobile*, dominating both the psychology of the play and the meaning of the lines. Thus the acting on their stages resembled a mixture of circus and cubistic ballet performance. Later, Meyerhold returned to the more or less naturalistic style. Some impressionists, such as Jessner and Evreinov, use formal methods interspersed with psychological touches. The actors on the French *avant-garde* stages work on somewhat similar lines at the Atelier directed by Dullin, in the productions of Pitoef and Jovet. At the *Vieux Colombie*, now closed, they used the same methods of acting. Copeau, the director of that theatre, must be considered as a pioneer, in France, in the fight against naturalism and the old fashioned Conservatoire acting. He definitely introduced such new methods of acting as the psychological and the formal on the French stage.

ACTINIC RAYS, ultra-violet rays which produce chemical changes. The term is sometimes popularly applied to the ultra-violet rays which are invisible, but can be detected by their action on a photographic plate and by rendering certain substances fluorescent (see FLUORESCENCE and PHOSPHORESCENCE). They are, to a certain extent, absorbed by the atmosphere, and, in moderate doses, have a beneficial effect on man. (See SPECTROSCOPY; LIGHT AND RADIATION IN RELATION TO HEALTH.)

ACTINIUM is one of the radioactive elements giving rise to a series of other elements. Its symbol is Ac, atomic number 89, and probable atomic weight 230. (See RADIOACTIVITY.)

ACTINOMETER, an instrument for measuring the heating and chemical effects of light. It is derived from the Greek, *aktis* ray, *metron* measure. The name was first given by Sir John Herschel to an apparatus for measuring the heating effect of solar rays (*Edin. Journ. Science*, 1825); Herschel's instrument has since been discarded in favour of the pyrheliometer (Gr. *πῦρ* fire, *ἥλιος* sun). (See RADIATION.) The word actinometer is now usually applied to instruments for measuring the *actinic* or chemical effect of luminous rays; their action generally depends upon photochemical changes. A type of actinometer is used in photography under the name of exposure-meter. In this instrument a section of sensitized bromide is exposed for a measured period of time. Certain practical forms are described in the article PHOTOGRAPHY.

ACTINOMYCOSIS (STREPTOTRICHOSIS), a chronic infective disease occurring in both cattle and man. In both these groups it presents the same clinical course, being characterized by chronic inflammation with the formation of granulomatous tumours, which tend to undergo suppuration, fibrosis or calcification. It used to be believed that this disease was caused by a single vegetable parasite, the Ray-Fungus, but there is now an overwhelming mass of observations to show that the clinical features may be produced by a number of different species of parasites, for which the generic name *Streptothrix* is adopted.

Pathological Anatomy.—The naked-eye appearance of the different organs affected by *Streptothrix* infection varies according to the duration and acuteness of the disease. In some tissues the appearance is that of a simple inflammation, whereas in others

it may be characteristic. The liver when affected shows scattered foci of suppuration, which may become aggregated into spheroidal masses, surrounded by a zone of inflammation. In the lungs the changes may be any that are produced by the following conditions: (1) An acute bronchitis. (2) A phthisical lung, grey nodules being scattered here and there almost exactly simulating tuberculous nodules. (3) An acute broncho-pneumonia with some interstitial fibrosis, and a tendency to abscess formation. The most characteristic lesions are in the skin.

The disease is more common in males than in females, and more prevalent in Germany and Russia than in England. The infection is probably spread by grain (corn or barley), on which the fungus may often be found. In a great number of recorded cases the patient has been following agricultural pursuits. The disease can only be transmitted from one individual to another with considerable difficulty, and no case of direct transmission from animal to man has yet been noted.

Clinical History.—The course of actinomycosis is usually a chronic one, but occasionally the fungus gets into the blood, when the course is that of an acute infective disease or even pyaemia. The symptoms are entirely dependent on the organ attacked, and are in no way specially characteristic. During life a diagnosis of phthisis is continually made, and only a microscopic examination after death renders the true nature of the disease apparent. The nature of the skin lesion is the most evident, and here the parasite may be detected early in the illness. The only drug which appears to have any beneficial influence on the course of the disease is potassium iodide, and this has occasionally been used with great benefit. Surgical interference is usually needed.

ACTINOTHERAPY: *see* LIGHT AND RADIATION IN RELATION TO HEALTH.

ACTINOZOA, an old technical name for Sea Anemones, now usually known as Actiniaria. (*See* ANTHOZOA.)

ACTION: *see* PRACTICE AND PROCEDURE.

ACTIUM (mod. PUNTA), the ancient name of a promontory in the north of Acarnania (Greece) at the mouth of the Sinus Ambracius (Gulf of Arta) opposite Nicopolis, built by Augustus on the north side of the strait. On the promontory was an ancient temple of Apollo Actius, which was enlarged by Augustus, who also, in memory of the battle, instituted or renewed the quinquennial games called *Actia* or *Ludi Actiaci*. Actiaca Aera was a computation of time from the battle of Actium. There was on the promontory a small town, or rather village, also called Actium.

History.—Actium belonged originally to the Corinthian colonists of Anactorium, who probably founded the worship of Apollo Actius and the *Actia*. In the 3rd century it fell to the Acarnanians, who subsequently held their synods there. Actium is chiefly famous as the site of Octavian's decisive victory over Mark Antony (Sept. 2, 31 B.C.). This battle ended a long series of ineffectual operations. The final conflict was provoked by Antony, who is said to have been persuaded by Cleopatra to retire to Egypt and give battle to mask his retreat; but lack of provisions and the growing demoralization of his army would sufficiently account for his decision. The fleets met outside the gulf, each over 200 strong (the totals given by ancient authorities are very conflicting). Antony's heavy fighting craft endeavoured to close and crush the enemy with their artillery; Octavian's light and mobile craft made skilful use of skirmishing tactics. During the engagement Cleopatra suddenly withdrew her squadron and Antony slipped away behind her. His flight escaped notice, and the conflict remained undecided until Antony's fleet was set on fire and thus annihilated.

ACTIVISM denotes any view that lays stress on action and its requirements. In *Psychology* it means the view that stresses the importance of conation rather than cognition (*see* ATTENTION, CONATION, PSYCHOLOGY). In *Philosophy* it denotes the view which makes utility the test of truth (*see* PRAGMATISM), or allows moral claims to justify certain theoretical assumptions (*see* KANT), or conceives of the ultimate principle of reality as some kind of will or activity (*see* ACTUALITY THEORY, SCHOPENHAUER, SPINOZA). In *Science* it means the view which emphasizes

the importance of the practical application of scientific discoveries—"knowledge is power" (*see* BACON).

ACT OF PARLIAMENT. An act of parliament may be regarded as a declaration of the legislature, enforcing certain rules of conduct, or defining rights and conferring them upon or withholding them from certain persons or classes of persons. Acts of Parliament fall into two classes—"Public" and "Private." The former are officially defined in the Commons' Manual of Procedure as having for their object "to alter the general law," the latter, "to alter the law relating to some particular locality, or to confer rights on or relieve from liability some particular person or body of persons." The collective body of such declarations constitutes the statutes of the realm or written law of the British nation, in the widest sense, from Anglo-Saxon times to the present day. It is not, however, till the earlier half of the 13th century that, in a more limited constitutional sense, the statute-book is generally held to open, and the parliamentary records only begin to assume distinct outlines late in the reign of Edward I. It gradually became a fixed constitutional principle that an act of parliament, to be valid, must express concurrently the will of the entire legislature. It was not, however, till the reign of Henry VI. that it became customary, as now, to introduce bills into parliament in the form of finished acts; and the enacting clause, regarded by constitutionalists as the first perfect assertion, in words, of popular right, came into general use as late as the reign of Charles II. It is thus expressed in the case of all acts other than those granting money to the Crown:—"Be it enacted by the King's most excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal and Commons in this present Parliament assembled, and by the authority of the same." In the very rare cases where bills have been enacted under the Parliament Act in opposition to the will of the Lords, the formula is varied, the words "Lords Spiritual and Temporal" being omitted, and the word "Commons" being followed by "in accordance with the provisions of the Parliament Act." Where the act is a money grant the enacting clause is prefaced by the words, "Most Gracious Sovereign, we, Your Majesty's most dutiful and loyal subjects, the Commons of the United Kingdom of Great Britain and Northern Ireland, in Parliament assembled, towards making good the supply which we have cheerfully granted to Your Majesty in this session of Parliament, have resolved to grant unto Your Majesty the sums hereinafter mentioned; and do therefore most humbly beseech Your Majesty that it may be enacted, etc." Originally the collective acts of each session formed but one statute, to which a general title was attached, and for this reason an act of parliament was up to 1892 generally cited as the chapter of a particular statute, e.g., 24 and 25 Vict. c. 101. Titles were, however, prefixed to individual acts as early as 1488. Now, by the Short Titles Act 1892, it is optional to cite the most important acts to that date by their short titles, either individually or collectively. Most modern acts have borne short titles independently of the Act of 1892. (*See* PARLIAMENT; STATUTE.)

ACT OF STATE, a term in law which may be generically described as an act of the Crown, or of some officer whose act is ratified by the Crown, which the courts will treat as conclusive and binding on them in any litigation before them. Such a defence or plea in bar can never be raised by the Crown against the subject except in respect of the exercise of the prerogative in international relations. For a full exposition of the subject, *see* STATE, ACT OF; and STATE SUCCESSION.

ACTON, JOHN EMERICH EDWARD DALBERG ACTON, 1st BARON (1834-1902), English historian, only son of Sir Richard Acton, 7th baronet, and grandson of the Neapolitan admiral, Sir J. F. E. Acton, 6th baronet (*q.v.*), was born at Naples on Jan. 10, 1834. Coming of a Roman Catholic family, young Acton was educated at Oscott till 1848, under Dr. (afterwards Cardinal) Wiseman, and then at Edinburgh, and at Munich under Döllinger, whose lifelong friend he became. He had wished to go to Cambridge, but for a Roman Catholic this was then impossible. By Döllinger he was inspired with a deep love of historical research and a profound conception of its functions as a critical instrument. He began at an early age to

collect a magnificent historical library, with the object, never in fact realized, of writing a great "History of Liberty." In politics he was always an ardent Liberal. He spent much time in the chief intellectual centres of Europe and in the United States, and numbered among his friends Montalembert, De Tocqueville, Fustel de Coulanges, Bluntschli, von Sybel and Ranke. In 1859 Sir John Acton was returned to the House of Commons for Carlisle and became a devoted admirer and adherent of Mr. Gladstone; but he was practically a silent member, and his parliamentary career came to an end in 1865. Meanwhile he had become editor of the Roman Catholic monthly paper, the *Rambler*, in 1859, on J. H. Newman's retirement from the editorship; and in 1862 he merged this periodical in the *Home and Foreign Review*.

Though a sincere Roman Catholic, his whole spirit as a historian was hostile to ultramontane pretensions, and his independence of thought and liberalism of view brought him into conflict with the Roman Catholic hierarchy. As early as Aug. 1862 Cardinal Wiseman publicly censured the *Review*; and when in 1864, after Döllinger's appeal at the Munich Congress for a less hostile attitude towards historical criticism, the pope issued a declaration that the opinions of Catholic writers were subject to the authority of the Roman congregations, Acton stopped the publication of his monthly periodical. He continued, however, to contribute articles to the *North British Review*. In 1865 he married the Countess Marie, daughter of the Bavarian Count Arco-Valley, by whom he had one son and three daughters. In 1869 he was raised to the peerage by Gladstone as Baron Acton; he was an intimate friend and constant correspondent of the Liberal leader, and the two men had the very highest regard for each other. Matthew Arnold used to say that "Gladstone influences all round him but Acton; it is Acton who influences Gladstone."

In the great crisis in the Roman Catholic world in 1870, over the promulgation by Pius IX. of the dogma of papal infallibility, Lord Acton was in complete sympathy on this subject with Döllinger (*q.v.*). Acton did not personally join the Old Catholic seceders. In 1874, when Gladstone published his pamphlet on *The Vatican Decrees*, Lord Acton wrote during Nov. and Dec. a series of letters to *The Times*, illustrating Gladstone's main theme by numerous historical examples of papal inconsistency, but demurring nevertheless to Gladstone's conclusion. In spite of his reservations, he regarded "communion with Rome as dearer than life." Thenceforth he devoted himself to persistent reading and study, combined with social life. Little indeed came from his pen, his only notable publication being a masterly essay in the *Quarterly Review* of Jan. 1878 on "Democracy in Europe"; two lectures delivered at Bridgnorth in 1877 on "The History of Freedom in Antiquity" and "The History of Freedom in Christianity"—these last the only tangible portions put together by him of his long-projected "History of Liberty"—and an essay on modern German historians in the first number of the *English Historical Review*, which he helped to found (1886). After 1879 he divided his time between London, Cannes, and Tegernsee in Bavaria. Gladstone found him a valuable political adviser, and in 1892, when the Liberal Government came in, Lord Acton was made a lord-in-waiting. Finally, in 1895, on the death of Sir John Seeley, Lord Rosebery appointed him to the Regius Professorship of Modern History at Cambridge. His inaugural lecture on "The Study of History," afterwards published with notes displaying a vast erudition, made a great impression in the university, and the new professor's influence on historical study was felt in many important directions. He delivered two valuable courses of lectures, on the French Revolution and on Modern History; but it was in private that the effects of his teaching were most marked. The great *Cambridge Modern History*, though he did not live to see it, was planned under his editorship, and all who came in contact with him testified to his stimulating powers and his extraordinary range of knowledge. He died on June 19, 1902, being succeeded in the title by his son, Richard Maximilian Dalberg Acton, 2nd baron Acton (b. 1870).

Lord Acton left too little completed original work to rank among the great historians. But he was one of the most deeply

learned men of his time, and he is remembered for his influence on others. His extensive library, composed largely of books full of his own annotations, was bought immediately after his death by Andrew Carnegie and presented to John Morley, by whom it was forthwith given to the University of Cambridge.

See Herbert Paul's excellent Introductory Memoir to the interesting volume of *Lord Acton's Letters to Mrs. Drew* (1904), and the authorities cited there; also Dom Gasquet's *Lord Acton and his Circle* (1906) and a selection from his correspondence, ed. by J. N. Figgis and R. V. Laurence, with introduction (1917 seq.). A *Bibliography of the Works of Lord Acton*, by W. A. Shaw, was published by the Royal Historical Society in 1903. The *Edinburgh Review* of April 1903 contains a luminous essay; and a chapter on Acton appears in Bryce's *Studies of Contemporary Biography* (1903). Lord Acton's *Lectures on Modern History*, ed. by J. N. Figgis and R. V. Laurence, appeared in 1906; and his *History of Freedom and other Essays and Historical Essays and Studies* (by the same editors) in 1907.

ACTON, SIR JOHN FRANCIS EDWARD, BART. (1736–1811), prime minister of Naples under Ferdinand IV., was the son of Edward Acton, a physician at Besançon, and was born there in 1736, succeeding to the English title and estates in 1791, on the death of his cousin in the third degree, Sir Richard Acton of Aldenham hall, Shropshire. He served in the navy of Tuscany, and in 1775 commanded a frigate in the joint expedition of Spain and Tuscany against Algiers. In 1779 Queen Maria Carolina of Naples persuaded her brother the grand-duke Leopold of Tuscany to allow Acton to reorganize the Neapolitan navy. He became commander-in-chief of both services, minister of finance, and finally prime minister. His policy was devised in concert with the English ambassador, Sir William Hamilton, and aimed at substituting the influence of Austria and Great Britain for that of Spain, at Naples, and consequently involved open opposition to France and the French party in Italy. In Dec. 1798 he shared the flight of the king and queen. For the reign of terror which followed the downfall of the Parthenopean republic, five months later, Acton has been held responsible. In 1804 he was for a short time deprived of the reins of government at the demand of France; but he was soon restored to his former position, which he held till, in Feb. 1806, on the entry of the French into Naples, he had to flee with the royal family into Sicily. He died at Palermo on Aug. 12, 1811.

He left three children, the elder son, Sir Richard, being the father of the first Lord Acton. The second son CHARLES JANUARIUS EDWARD (1803–1847), after being educated in England and taking his degree at Magdalene college, Cambridge, in 1823, entered the Academia Ecclesiastica at Rome. He became the secretary of the congregation of the Disciplina Regolare, and auditor of the Apostolic Chamber under Gregory XVI., by whom he was made a cardinal in 1842. Cardinal Acton helped to secure the increase, in 1840, of the English vicariates-general to eight, which paved the way for the restoration of the hierarchy by Pius IX. in 1850. He died on June 23, 1847.

ACTON, municipal borough, Middlesex, England, suburban to London, 9m. W. of St. Paul's cathedral. Population (1861) 3,151; (1901) 37,744; (1931) 70,523. The best derivation offered for its name is from Oak-town; in reference to the extensive forest which formerly covered the locality. The land belonged from early times to the See of London, a grant being recorded in 1220. Henry III. had a residence here. At the time of the Commonwealth Acton was a centre of Puritanism. Philip Nye (d. 1672) was rector; Richard Baxter, Sir Matthew Hale (Lord Chief Justice), Henry Fielding the novelist and John Lindley the botanist (d. 1865) are famous names among residents here. Acton Wells, of saline waters, had considerable reputation in the 18th century. There are stations on the G.W.R., the L.M.S.R., the District and the C.L.R. Acton is governed by a mayor and corporation of 32 members. It was made a municipal borough in 1921. Area, 2,305 acres. It forms the Acton division of the parliamentary county of Middlesex (*q.v.*).

ACT ON PETITION, the term for a part of the procedure in the British Probate, Divorce and Admiralty Division, now of infrequent occurrence. It was more freely used in the old Admiralty and Divorce courts before the Judicature Acts. (See *DIVORCE*.)

ACTS OF THE APOSTLES. This book of the Bible was originally the sequel of the Gospel of Luke. Its separation was due to a growing view of the Gospels as a unit of sacred records, to which *Acts* stood as appendix. Historically it is of unique interest and value. The Apocryphal Acts of certain apostles, witnessing to the impression produced by our *Acts*, only emphasize this. It is the one really primitive Church history, primitive in spirit as in substance; apart from it a real picture of the Apostolic age would be impossible. With it, the Pauline Epistles are of priceless historical value; without it, they would remain bafflingly fragmentary, often even misleading owing to their "occasional" nature and emphasis.

Plan and Aim.—All agree that *Acts* is the work of an author of high literary skill, and that he exercised careful selection in the use of his materials, in keeping with a definite purpose and plan. It is of moment, then, to discover what these were. Here it is not needful to go farther back than F. C. Baur and the Tübingen school, with its theory of sharp antitheses between Judaic and Gentile Christianity, of which they took the original apostles and Paul to be typical. Gradually this position underwent modifications, as it became realized that neither Jewish nor Gentile Christianity was a uniform genus, and that the apostolic leaders from the first stood for mutual understanding and unity. The Tübingen school put the needful question, but did not return the correct answer because, as Ritschl showed (*Altkath. Kirche*, 2nd ed., 1857), their premises were inadequate. Still the attitude created by the theory persists in much that is written about *Acts*. On the whole, however, scholars now look at the book more objectively and follow up the hints as to its aim given by the author in his opening paragraph (i. 1-11). Thus (1) his second narrative is the natural sequel to his first. As the earlier book set forth in orderly sequence (*καθεξής*) the providential stages by which Jesus was led, "in the power of the Spirit," to begin the establishment of the Kingdom of God, so the later sets forth its extension by means of His chosen representatives or apostles. (2) This involves emphasis on the identity of the power, Divine and not merely human, visible in the great series of facts from first to last; God's Spirit appears as active throughout. But further (3), the Divine energy in the disciples is conditioned by the continued influence and violation of their "Lord" at His Father's right hand in heaven: "Holy Spirit" (without the article), the holy power of His personality (*see* xvi. 7 "the Spirit of Jesus"), is the living link between His action and theirs (i. 2, 4 *seq.*, 8, ii. 1 *seq.*, *cf.* Luke xxiv. 49). And (4) the scope of this action is nothing less than all mankind (ii. 5 *seq.*), especially within the Roman empire. (5) Finally, as we see from the parallel in Luke xxiv. 46-48, the divinely appointed method of victory is through suffering (*Acts* xiv. 22), as it was for Messiah himself. This explains the space devoted to the tribulations of His witnesses, and their constancy amid them. It forms part of the virtual *apologia* for the absence of that earthly prosperity in which the ancient mind was apt to look for Divine approval. Moreover the Church's foes were chiefly Jews, whose opposition our author regards as due to blindness to the wider reading of their own religion—to which the Holy Spirit had from of old been pointing (*cf.* Stephen's speech)—and to jealousy of those who, by preaching the wider Messianic Evangel, were winning the Gentiles, and particularly proselytes, in such numbers.

These, then, seem to be the author's main *motifs*:—the *universality of the Gospel*, the *jealousy of national Judaism*, and the *Divine initiative*, manifest particularly in the gradual stages by which men of Jewish birth were led in spite of their own prejudices, to recognize the Divine will in the setting aside of national restrictions, alien to the universal destiny of Messiah's Church. The practical moral is the *Divine character of the Christian religion*, as evinced by the manner of its extension in the empire, no less than by its original expression in the Founder's life and death. Thus both parts of the author's work alike tend to produce assured conviction of Christianity as of Divine origin (Luke i. 1, 4; *Acts* i. 1 *seq.*).

This view gives the book a practical religious aim—a *sine qua non* to any theory of an early Christian writing. In spite of all difficulties, this religion is worthy of belief, even though it mean

opposition and suffering. To meet this source of doubt the author holds up the picture of earlier days, when the great Apostle of the Gentiles enjoyed protection at the hands of Roman justice. It is implied that the present distress is but a passing phase, resting on misunderstanding; for Christianity, as the true fulfilment of Israel's religion, had once been (and might again be) treated as a recognized or lawful (*licita*) religion, the more so that it had deep kinship with non-Jewish philosophic monotheism. Meantime the example of apostolic constancy should inspire like fidelity. *Acts* is in fact an Apology for the Church as distinct from Judaism, the breach with which is accordingly traced with fullness and care.

From this standpoint *Acts* no longer seems to end abruptly. Whether as exhibiting the Divine leading and aid, or as recording the normal attitude of the Roman State, the writer has reached a climax, "Paulus Romae, apex Evangelii" (Bengel). In keeping with this, verses 26-28 of chap. xxviii. are the solemn close of the work, while verses 30, 31 are an appended observation. Yet even here, by the final word of all "unmolested," the writer ends most fitly on one of his keynotes.

The full force of this is missed by those who, rightly rejecting the idea that he had in reserve enough history to furnish another work, hold that Paul was freed from the imprisonment in which *Acts* leaves him (*see* PAUL). For those, on the other hand, who see in the writer's own comment in xx. 38, uncontradicted by what follows, a broad hint that Paul never saw his Ephesian friends again, the view is open that his end was too well known to call for explicit record. Nor would such silence be disingenuous, any more than on the theory that martyrdom overtook him later. (The view that *Acts* was written before Paul's death is excluded by the date of Luke's Gospel.) To the writer Paul's death (like the horrors of Nero's Vatican Gardens in 64) was a monstrous exception to the rule of Roman policy heretofore illustrated. Not even by the Romans themselves were all Nero's acts regarded as precedents.

Authorship.—External evidence, which is early and widespread (*e.g.*, Irenaeus, Muratorian Canon, Tertullian, Clement), all points to Luke, Paul's companion, probably his physician (Col. iv. 14). Evidence for his authorship of the third Gospel counts also for *Acts*. This carries us back at least to the second quarter of the 2nd century (Justin, *Dial.* 103, and Marcion). Nor was Luke prominent enough as an associate of Paul for the belief to be a mere guess. If, then, the Lucan authorship is to be doubted, it must be on internal evidence. The form of the book, however, favours Luke, who was of non-Jewish birth (*see* Col. iv. 12-14 with 10 *seq.*), and as a physician presumably a man of culture. The medical cast of some of its language points the same way. This argument, first worked out by Dr. W. K. Hobart, *The Medical Language of St. Luke* (Dublin, 1882), has been urged afresh in Harnack's *Luke the Physician* (1907), to which reference may be made for all matters connected with Lucan authorship. The early tradition that this Luke was born in the Syrian Antioch suits the way in which the origin of the Antiochene Church and its place in the extension of the Gospel are described (*see* LUKE). Again, the attitude of *Acts* towards the Roman empire is just what would be expected from a comrade of Paul, but hardly from a man who belonged to the next generation. Finally, the book itself seems to claim to be by a companion of Paul. In chap. xvi. 10 without any previous warning it passes from the third person to the first. "But when he saw the vision, straightway we sought to go forth into Macedonia." Thenceforth "we" re-emerges at certain points in the narrative until Rome is reached. These parts at least are generally held to imply the narrative of an eye-witness. If so, this eye-witness was probably also the author of the work; for the style of the "we" passages is the same as that of the book as a whole (*see* Sir J. C. Hawkins in *Horae Synopticae*, 1899, pp. 143-147). In a word, the author of *Acts* was Luke, Paul's companion during most of his later ministry, and also his "counterpart," "as a Hellene who yet had personal sympathy with Jewish primitive Christianity" (Harnack, *op. cit.* p. 145; *see* also LUKE).

Sources.—So far from such a plan and such an author being inimical to the quest after the materials used in *Acts* one may say

that it points the way thereto, while it keeps literary analysis within scientific limits. In their light one feels that the speeches in its first part (e.g., that of Stephen)—and indeed elsewhere, too—are not “free compositions” of our author, the outcome of dramatic idealization such as ancient historians like Thucydides or Polybius allowed themselves. The Christology, for instance, of the early Petrine speeches is such as a Gentile Christian writing c. A.D. 80 simply could not have imagined. We are forced to assume the use of early Judæo-Christian material, akin to that implied also in the special parts of the Third Gospel. P. Feine (*Eine vorkanonische Ueberlieferung des Lukas*, 1891) suggested that a single document explains this material in both works, as far as Acts xii. Others maintain that at any rate two sources underlie Acts i.-xii., or even i.-xv. (see A. Harnack, *The Acts of the Apostles*, 162 seq. and Foakes Jackson and Kirsopp Lake, *The Beginnings of Christianity*, pt. i. vol. ii. 122 seq.). Certainly we can discern the presence of traditions of the Jerusalem Church and of the largely Hellenistic Church of Antioch. But it remains a question whether they reached our author in written form. If he was a careful inquirer (Luke i. 3), especially if he was in the habit of taking down in writing what he heard from different witnesses, this may explain the phenomena (including the alleged traces of “Aramaisms”). Luke would have rare facilities for collecting Palestinian materials, varying no doubt in accuracy but all relatively primitive, whether in Antioch or in Caesarea, where he probably resided for some two years in contact with Philip the Evangelist and his daughters (xxi. 8). There and elsewhere he might also learn a good deal from John Mark, Peter’s friend (I. Pet. v. 13; Acts xxi. 12).

In the second or strictly Pauline half, two main theories of the so-called “we” passages are possible: (1) that which sees in them traces of an earlier document—whether a travel-diary or a more consecutive narrative written later; and (2) that which regards the “we” as due to the author’s breaking instinctively into the first person plural where he felt himself specially identified with the history. On the former hypothesis, it is still in debate whether the “we” document lies behind more of the narrative than is definitely indicated by the formula in question (e.g., chaps. xiii.-xv., xxi. 19-xxvi.). On the latter, the presence or absence of “we” may well be due to psychological causes, rather than to the writer’s mere presence or absence. Sometimes, he may be writing as a member of Paul’s mission at the critical stages of onward advance (xvi. 10 seq., xx. 5 seq., xxvii. 1 seq.); sometimes rather as a witness absorbed in his hero’s words and deeds (so “we” ceases between xx. 15 and xxi. 1). In the former cases the whole “mission” was on the move.

Historical Value.—Questions of authorship and sources are of moment mainly as bearing on the contents as history (see *Beginnings of Christianity*, as above, pp. 265-348). *Acts* falls into two distinct parts. The first (i.-xii.) deals with the church in Jerusalem and Judæa, and with Peter as central figure—at any rate in chaps. i.-v. The difficulty here is that we have but few external means of testing the narrative (see further, *Date*). Some of it may have suffered partial transformation in oral tradition before reaching our author; e.g., the nature of the Tongues at Pentecost does not accord with what we know of the gift of “tongues” generally. The second part pursues the history of the apostle Paul; and here we can compare it with his Epistles. The result is a general harmony, without any trace of direct use of these letters; and there are many minute coincidences. But there are also two remarkable exceptions. These are, the account given by Paul of his visits to Jerusalem in *Galatians* as compared with *Acts*; and the nature of his mission, as it appears in his letters and in *Acts*.

In regard to the first point, differences as to Paul’s movements before his return to his native province of Syria-Cilicia (see PAUL) can be explained by the different interests of Paul and our author respectively. But what of the visits of Gal. ii. 1-10 and Acts xv.? If they refer to the same occasion, as is usually assumed, it is hard to see why Paul should omit reference to the public occasion of the visit and to the public vindication of his policy. But in fact the issues of the visits, as given in Gal. ii. 9 seq. and

Acts xv. 20 seq., are not at all the same (Harnack [*op. cit.* pp. 245 seq.] and others vainly argue that the Abstinenes defined for Gentiles were in the original text of Acts xv. 20 purely moral, and had no reference to Jewish scruples as to eating blood). Nay more, if Gal. ii. 1-10 = Acts xv., the historicity of the “Relief visit” of Acts xi. 30, xii. 25, seems excluded by Paul’s narrative before the visit of Gal. ii. 1 seq. Accordingly, Sir W. M. Ramsay and others argue that the latter visit itself coincided with the Relief visit, and see in Gal. ii. 10 witness thereto. But why, then, does not Paul refer to the public charitable object of his visit? It seems easier therefore to admit that the visit of Gal. ii. 1 seq. is one unrecorded in *Acts*, owing to its private nature as preparing the way for public developments—with which *Acts* is mainly concerned. In that case it would fall shortly before the Relief visit, to which there may be indirect explanatory allusion in Gal. ii. 10 (see further PAUL); and it will be shown below that such a conference of leaders in Gal. ii. 1 seq. leads up excellently both to the First Mission Journey and to Acts xv. (For other views see *The Beginnings of Christianity*, 273 seq., 321 seq.)

We pass next to the Paul of *Acts*. In his epistles Paul insists that he was the apostle to the Gentiles, as Peter was to the Circumcision; and that circumcision and the observance of the Jewish law were of no importance to the Christian as such. But in *Acts* it is Peter who first opens up the way for the Gentiles. It is Peter who used the strongest language in regard to the intolerable burden of the Law as a means of salvation (xv. 10 seq. cf. 1.). Not a word is said of difference between Peter and Paul at Antioch (Gal. ii. 11 seq.). The brethren in Antioch send Paul and Barnabas up to Jerusalem to ask the opinion of the apostles and elders; they state their case, and carry back the decision to Antioch. Throughout *Acts* Paul never stands forth as the unbending champion of the Gentiles. He seems anxious to reconcile the Jewish Christians by personally observing the law of Moses. He circumcises the semi-Jew, Timothy; and he performs his vows in the temple. He is particularly careful in his speeches to show how deep is his respect for the law of Moses. In all this the letters of Paul are very different from *Acts*. In *Galatians* he claims perfect freedom in principle, for himself as for the Gentiles, from the obligatory observance of the Law; and neither in it nor in *Corinthians* does he take any notice of a decision reached at Jerusalem. The narrative of *Acts*, too, itself implies something other than what it sets in relief; for why should the Jews hate Paul so much, if he was not in some sense disloyal to their Law?

There is, nevertheless, no essential contradiction here, only such a difference of emphasis as belongs to the standpoints and aims of the two writers and to different historical conditions. Peter’s function in relation to the Gentiles belongs to early Palestinian conditions, before Paul’s distinctive mission had taken shape. Once Paul’s apostolate—parallel with the more collective apostolate “the Twelve”—has proved itself by tokens of Divine approval, Peter and his colleagues frankly recognize the distinction of the two missions, and are anxious only that the two shall not fall apart by religiously and morally incompatible usages (Gal. ii. 10, cf. Acts xv.). Paul, on his side, clearly implies that Peter felt that the Law could not justify (Gal. ii. 13 seq.), and argues that it could not now be made obligatory in principle (cf. “a yoke,” Acts xv. 10); yet for Jews it might continue for the time (pending the Parousia) to be seemly and expedient, especially for the sake of non-believing Judaism. To this he conformed his own conduct as a Jew, so far as his Gentile apostolate was not involved (I Cor. ix. 19 seq.). There is no reason to doubt that Peter largely agreed with him, since he acted in this spirit in Gal. ii. 11 seq., until coerced by Jerusalem sentiment to draw back for expediency’s sake. This incident it did not fall within the scope of *Acts* (see above) to narrate, since it had no abiding effect on the Church’s extension. As to Paul’s submission of the issue in Acts xv. to the Jerusalem conference, *Acts* does not imply that Paul would have accepted a decision in favour of the Judaizers, though he saw the value of getting a decision for his own policy in the quarter to which they were most likely to defer. If the view that he already had an understanding with the “Pillar” Apostles, as recorded in Gal. ii. 1-10 (see further PAUL), be correct, it gives

the best of reasons why he was ready to enter the later public Conference of Acts xv. Paul's own "free" attitude to the Law, when on Gentile soil, is just what is implied by the hostile rumours as to his conduct in Acts xxi. 21, which he was glad to disprove as at least exaggerated (*ib.* 24 and 26). What is clear is that such lack of formal accord as here exists between *Acts* and the Epistles tells against its author's dependence on the latter, and so favours his having been a comrade of Paul himself.

Speeches.—The speeches in *Acts* deserve special notice. Ancient historians (like many of modern times) used the liberty of working up in their own language the speeches recorded by them. They did not dream of verbal fidelity; they preferred to mould a speaker's thoughts to their own methods of presentation. Besides this, some did not hesitate, for vividness' sake, to give to their characters speeches which were never uttered. Now how far has the author of *Acts* followed these practices? Some of its speeches are evidently bare summaries. Others claim to be reports of speeches really delivered. But all have been passed through one mind, and some mutual assimilation in phraseology and idea may well have resulted. They are, moreover, all of them, mere abstracts. Yet these circumstances, while inconsistent with verbal accuracy, do not destroy authenticity; and in most cases (*e.g.* xiv. 15–17) there is a varied appropriateness, as well as an allusiveness, pointing to good information (*see* under *Sources*). There is no evidence that any speech in *Acts* is the free composition of its author, without either written or oral basis; and in general he seems nearer than most ancient historians to the essentials of historical accuracy.

Miracles.—Objections to the trustworthiness of *Acts* on the ground of its miracles require to be stated more carefully than has usually been the case especially as bearing on authorship. For the idea of the "miraculous" or supernormal is hardly if at all, less marked in the "we" sections (where efforts to dissect it out are fruitless) than in the rest of the work. The scientific method, then, is to consider each "miracle" on its own merits, according as we may suppose that it has reached our author more or less directly. But even the form in which the gift of Tongues at Pentecost is conceived does not exclude Luke's authorship, since it may have stood in his source; and the first outpouring of the Messianic Spirit may soon have come to be thought of as unique by some Jewish Christians, parallel in form to the Rabbinic tradition as to the inauguration of the Old Covenant at Sinai (*cf.* Philo, *De decem oraculis*, 9, 11, and the Midrash on Ps. lxxviii. 11).

As to such historical difficulties in *Acts* as still remain, there are various possibilities of mistake intervening between the facts and the accounts which reached its author, at second or even third hand (*see* further under *Date*). Also recent research in antiquity has tended to verify such parts of the narrative as can be tested, as Sir W. M. Ramsay in particular has shown. The proofs of trustworthiness extend also to the theological sphere. What was said of the Christology of the Petrine speeches applies to the whole conception of Messianic salvation, the eschatology, the idea of Jesus as equipped by (the) Holy Spirit for His Messianic work. These and other forms of very primitive witness in *Acts* have not indeed the value of shorthand notes or even of abstracts based thereon. But they suggest that our author gave a faithful account of such words and deeds as had come to his knowledge. The perspective of the whole is no doubt his own; and as his materials furnished but few hints for a continuous narrative, this perspective, especially in things chronological, may sometimes be faulty. Yet when one remembers that by A.D. 70–80 it must have been a matter of small interest by what tentative stages the Messianic salvation was first extended to the Gentiles, it is surely surprising that *Acts* enters into any detail on the subject, and is not content with a summary account such as the mere logic of the matter would naturally suggest.

"Study of Sources" (*Quellenkritik*), then, solves many difficulties in the way of treating *Acts* as an honest narrative by a companion of Paul. In addition, we may also count among recent gains a juster method of judging such a book. For among the results of the Tübingen criticism was what Dr. W. Sanday called "an unreal and artificial standard, the standard of the 19th cen-

tury rather than the 1st, of Germany rather than Palestine, of the lamp and the study rather than of active life." This has a bearing, for instance, on the differences between the three accounts of Paul's conversion in *Acts*. In the recovery of a more real standard, we owe much to men like Mommsen, Ramsay, Blass and Harnack, trained amid methods and traditions other than those which had brought the constructive study of *Acts* almost to a deadlock. Nor have the results of recent similarly jealous suspicion (of which Loisy is the type) won any wide consensus among scholars.

Date.—External evidence points to the existence of *Acts* at least as early as the opening years of the 2nd century. The traces of it in Polycarp and Ignatius, when taken together, are highly probable; and the resemblance of Acts xiii. 22, and I Clem. xviii. 1, in features not found in the Psalm (lxxxix. 20) quoted by each, can hardly be accidental (*see The N.T. with Apostolic Fathers*, 48 *seq.*). That is, *Acts* was probably current in Rome as early as c. A.D. 95. With this view internal evidence agrees. In spite of some advocacy of a date prior to A.D. 70, the bulk of critical opinion is against it. The prologue to Luke's Gospel implies the dying out of eye-witnesses as a class. Many support a date about A.D. 80; some prefer 75 to 80; while a date even before 75 seems possible. Of the reasons for a date in one of the earlier decades of the 2nd century, as argued by the Tübingen school, most are now untenable. Among these are the supposed traces of 2nd-century Gnosticism and "hierarchical" ideas of organization; while the argument from the relation of the Roman state to the Christians has been turned by Ramsay into proof of an origin prior to Pliny's correspondence with Trajan, c. 112. Another fact tells against a 2nd-century date, *viz.* the failure of a writer devoted to Paul's memory to avoid seeming conflict with his Epistles. If, indeed, *Acts* uses the later works of Josephus, we should have to place it about A.D. 100. But this is far from proved.

Three points of contact with Josephus in particular are cited. (1) The circumstances attending the death of Herod Agrippa I. in A.D. 44. Here Acts xii. 21–23 is largely parallel to Jos. *Antt.* xix. 8. 2; but the latter adds an omen of coming doom, while *Acts* alone gives a circumstantial account of the occasion of Herod's public appearance. Hence the parallel, when analysed, tells against dependence. So also with (2) the case of the Egyptian pseudo-prophet in Acts xxi. 37 *seq.*, Jos. *Jewish War*, ii. 13. 5, *Antt.* xx. 8. 6; for the numbers do not agree with either of Josephus's rather divergent accounts, while *Acts* alone speaks of *Sicarii*. With these instances in mind, it is best to regard (3) the curious resemblance in v. 36 *seq.* and Jos. *Antt.* xx. 5. 1 as to the order in which Theudas and Judas of Galilee are referred to in both as accidental, the more so that again there is difference as to numbers. There may well have been another Theudas, in the period of many tumults after the death of Herod the Great to which Josephus refers in *Antt.* xvii. 10. 4, whom as a pseudo-Messiah on so small scale he might not think worth while mentioning after A.D. 70; whereas to Gamaliel the case was not long before his own time ("before these days"). Further, to make out a case for dependence, one must assume the mistaken order in Gamaliel's speech as due to gross carelessness in the author of *Acts*. Such a mistake, if really there, was far more likely to arise in oral transmission of the speech, before it reached Luke at all.

Place.—The place of composition is still an open question. Rome and Antioch have been in favour; and Blass combined both views in his theory of two editions (*see* further, *Text*). But internal evidence points to the Roman province of Asia, and the neighbourhood of Ephesus. Note the confident local allusion in xix. 9 to "the school of Tyrannus"—not "a certain Tyrannus," as in the inferior text—and in xix. 33 to "Alexander"; also the very minute topography in xx. 13–15. Affairs in that region, including the future of the church of Ephesus (xx. 28–30), are treated as though they would specially interest "Theophilus" and his circle: also an early tradition makes Luke die in the adjacent Bithynia. An *apologia* for the Church against the Synagogue's attempts to influence Roman policy to its harm would be much to the point in "Asia" (*cf.* Rev. ii. 9, iii. 9, and Sir W. M. Ramsay, *The Letters to the Seven Churches*, ch. xii.).

Text.—The *apparatus criticus* of *Acts* has grown considerably of recent years; mainly in one direction, that of the so-called "Western text." This misleading term really stands for a glossing or paraphrastic text, comparable to a Targum on an Old Testament book, which became very widespread, in both east and west, for some 200 years or more from early in the 2nd century. The sifting, however, of the readings in all our witnesses (mss., versions, Fathers) has not yet gone far enough to yield final results as to the history of this text—what in its extant forms is primary, secondary, and so on. Beginnings only have been made towards grouping our authorities (see J. H. Ropes' fine study in *Beginnings of Christianity*, pt. i., vol. iii. pp. ccxv.). Assuming, however, that the original form of the "Western" text had been reached, the question of its historical value, i.e. its relation to the original text of *Acts*, would remain. On this point the highest claims were made by Blass (1894 and later), who held that both the "Western" text of *Acts* (styled the β text) and its rival, the text of the great uncials (the α text), are due to the author's own hand; and that the former (Roman) is more original than the latter (Antiochene); but the theory (as Ropes shows) is untenable. Sir W. M. Ramsay pointed the way to sounder views. Already in *The Church in the Roman Empire* (1893) he held that the "Western" text in the *Codex Bezae* rested on a recension made not later than about the middle of the 2nd century. Though "some at least of the alterations in *Codex Bezae* arose through a gradual process," the revision as a whole was the work of a single reviser. His aim, in suiting the text to the views of his place and time, was to make it at once more intelligible and more complete. In his later work, *St. Paul the Traveller and the Roman Citizen* (1895), Ramsay's views gained in breadth by looking beyond the Bezan text to the "Western" text as a whole.

But all earlier work on the text of *Acts* is summed up and improved in Ropes' monumental edition (as above). Generally speaking, the text as printed by Westcott and Hort, on the basis of the earliest mss. (NB), seems in *Acts*, as elsewhere, to be nearest to the autograph: the "Western" text, even in its earliest form, was a deliberate revision. This does not mean that it has no historical value of its own. Certain of its readings (e.g. xi. 28, xii. 10) may even date from the end of the 1st century and preserve living memories. But their value is mainly that of an early commentary, and lies in the light cast on ecclesiastical thought in certain quarters and epochs. *Acts*, from its very scope, was least likely to be viewed as sacrosanct in its text. Indeed there are signs that its undogmatic nature caused it to be comparatively neglected at certain times and places, as, e.g., Chrysostom explicitly witnesses.

BIBLIOGRAPHY.—An account of the extensive literature that has gathered round *Acts* may be found in R. J. Knowling's ed. in *The Expositor's Greek Testament* vol. ii. (1900), and in his *Testimony of St. Paul to Christ* (1905); C. Clemens, *Die Apostelgesch. im Lichte der neueren Forschungen* (Giessen, 1905); A. Harnack, *Acts of the Apostles* (1909); J. Moffatt's *Introduction to the N.T.* (1911 and later); and particularly, Foakes Jackson and Kirsopp Lake, *The Beginnings of Christianity* pt. i. (1920-28); H. J. Cadbury, *The Making of Luke-Acts* (1927). (J. V. B.)

ACTUALITY THEORY is the view that the real is not a thing or a state at rest, but an activity or a process.

In philosophy the theory is as old as Heraclitus who conceived ultimate reality as an incessant becoming, not as static being. In modern philosophy Spinozism may be regarded as a form of this theory. For, notwithstanding the important place which the conception of "substance" holds in the philosophy of Spinoza, Spinozism when correctly interpreted is essentially dynamic, not static, in character. Of subsequent philosophers the following (among others) may be regarded as upholders of the actuality theory in some form or other. Fichte conceived of the real as the infinite activity of the absolute ego. Hegel regarded it as an absolute process, a kind of dialectical evolution. Schopenhauer described it as volitional activity or striving. Wundt likewise thought of reality as a complex of volitional activities or processes. For Bergson "there are no things, only activities" (*Creative Evolution*). Of philosophical men of science Mach, Ostwald, and Whitehead (among others) may be claimed as supporters of the actuality theory. Indeed the whole drift of present day science is to regard

"events" rather than "things" as the ultimate components of the world of reality.

In psychology the actuality theory is mainly concerned with the nature of the soul or mind. According to the popular view, which is also supported by many psychologists, the mind or soul is a substance, an abiding something which owns the mental experiences of knowing, feeling, and willing, or which exercises these activities. As against this "substantial" view of the soul, the actuality theory in psychology treats the soul as just the complex or system of these activities, experiences, or processes, and no more. The view appears to be as old as Protagoras and Aristotle. It is quite explicit in Spinoza, for whom the human soul is just a complex of ideas, and ideas are not dead, static pictures on a canvas, but living activities. Hume likewise stated that his introspective attempt to catch a glimpse of his soul revealed to him nothing but "a bundle" of sensations, etc. Of modern psychologists, Fechner, Höffding, James, Baldwin, Ebbinghaus, Sully, and Wundt (among others) may be classed among the supporters of the actuality theory, while other psychologists are more or less in sympathy with it, though they regard the whole question as pertaining to philosophy rather than to psychology. On one point, however, all modern psychologists are agreed, namely, that mental experiences are essentially events, activities, or processes, not states. And this agreement is largely the result of the contention of the upholders of the activity theory.

ACTUARY. The name of *actuarius*, sc. *scriba*, in ancient Rome, was given to the clerks who recorded the *Acta Publica* of the senate, and also to the officers who kept the military accounts and enforced the due fulfilment of contracts for military supplies. In its English form the word has undergone a gradual limitation of meaning. At first it seems to have denoted any clerk or registrar; then more particularly the secretary and adviser of any joint-stock company, but especially of an insurance company; and it is now applied specifically to one who makes those calculations as to the probabilities of human life, on which the practice of life assurance and the valuation of reversionary interests, deferred annuities, etc., are based.

The Actuarial Society of America, which is a scientific organization founded in 1889 for the promotion of actuarial science, had more than 300 members in 1929. The Society publishes Transactions containing the proceedings of meetings and special studies. Enrollment is not limited to Americans.

The Institute of Actuaries (Staple Inn hall, London) and the Faculty of Actuaries, in Scotland (Edinburgh) are incorporated by royal charter. The membership of the respective bodies was 1,046 (March 1928) and 247 (June 1928). Their objects are identical, namely, to promote the efficiency of actuaries, whose function, briefly stated, is to apply the doctrine of probabilities to practical affairs. The examinations are very similar and embrace advanced algebra, finite differences, the differential calculus and statistics. The practical part covers the theory of compound interest and annuities—certain and of life and other contingencies, the compilation of tables of mortality, sickness, accident, etc., the calculation of premium rates and all rates of contribution for life assurances, annuities, sickness funds, widows' and orphans' funds, and friendly societies, as well as to a limited extent, investments and law. The registrar in the Lower House of Convocation of the Church of England in the Province of Canterbury is also called the Actuary. See INSURANCE, ARTICLES ON.

ACUMINATE, sharpened or pointed, a word used principally in botany and ornithology to denote the narrowing or lance-shaping of a leaf or of a bird's feather into a point. The poet Cowper used the word to denote sharp and keen despair, but other authors, Sir T. Browne, Bacon, etc., use it to explain a material pointed shape.

ACUÑA, CHRISTOVAL DE (1597-c. 1676), Spanish Jesuit missionary and explorer, was born at Burgos in 1597. He was sent on mission work to Chile and Peru, where he became rector of the college of Cuenca. In 1639 he accompanied Pedro Texiera in his second exploration of the Amazon, in order to take scientific observations, and draw up a report for the Spanish Government. The journey lasted ten months; on the explorer's

arrival in Peru, Acuña prepared his narrative, while awaiting a ship for Europe. The king of Spain, Philip IV., received the author coldly, and it is said even tried to suppress his book, fearing that the Portuguese, who had just revolted from Spain (1640), would profit by its information. Eventually Acuña returned to South America, where he died, probably soon after 1675. His *Nuevo Descubrimiento del Gran Río de las Amazonas* was published at Madrid in 1641; French and English translations (the latter from the French), appeared in 1682 and 1698.

ACUPRESSURE, the name given to a method of restraining haemorrhage, introduced by Sir J. Y. Simpson, the direct pressure of a metallic needle, either alone or assisted by a loop of wire, being used to close the vessel near the bleeding point.

ACUPUNCTURE, a form of surgical operation, performed by pricking the part affected with a needle. It has long been used by the Chinese in cases of headaches, lethargies, convulsions, colics, etc.

ADA, a city of Oklahoma, 85m. S.E. of Oklahoma City; served by the Santa Fe, the Frisco and the Oklahoma City-Ada-Atoka railways. The population, nearly all native whites, increased from 4,349 in 1910 to 11,261 in 1930. Ada is the county seat of Pontotoc county, which produces natural gas and petroleum, cotton, grain, live stock, sweet potatoes, peanuts and alfalfa; and has deposits of rock asphalt, glass sand, pottery clay, lead, zinc and other minerals. The city has cotton gins and compresses; feed and corn-mills; cement, stone-crushing, pottery and glass works; brick-yards and grain elevators. It is the seat of the East Central State teachers college (1909), which in 1926-27 had an enrolment of about 2,400 students. The city was incorporated in 1901. It has a commission form of government.

ADA, a village of Hardin county, O., U.S.A., on the Pennsylvania railroad, 15m. E. of Lima, with a population of 2,499 in 1930. It lies on the watershed between the Ohio river and the Great Lakes, in a rich agricultural district. Natural gas is available. The village has canning and packing plants, and manufactures stoves and tiles. It is the seat of the Ohio Northern university (Methodist) which in 1926-27 had an enrolment of about 1,700 students.

ADAB (modern BISMAYA), an ancient town in Mesopotamia, in 32° N., 45° 30' E., 25m. S. of Nippur. It was supplied by a canal which passed through the city and irrigated the country, eventually falling into the Shatt al Hai. In the centre of the city the canal divided to form an island on which stood the temple of the mother Goddess Aruru, to whose cult the city was devoted. There are a succession of periods on the mound which rises 50ft. above the plain: 2 to 3ft. below the platform of Ur Engur are the buildings of the kings of Akkad; 10ft. below are the plano-convex bricks of Unnina; 10ft. lower are buildings made of limestone blocks, which were used before the days of brickmaking. At a depth of 48ft. the excavators found thin unpainted wheel-made pots. The Ziggurat or temple tower is pre-Sargonic and one of the oldest in Sumer. One of the most remarkable finds was the head of a Semite in white marble.

The city appears to have enjoyed a restricted independence at the time of the kings and patesis of Lagash. The kings of Akkad and Ur certainly devoted a good deal of attention to the city, probably owing to its religious cults.

See E. J. Banks, *Bismaya or the Last City of Adab* (1912); S. Langdon, in *Cambridge Ancient History*, vol. i. 1923.

ADABAZAR, an important commercial town in the Khoja Ili sanjak of Asia Minor, situated on the old military road from Constantinople to the East, and connected by a branch line with the Anatolian railway. Pop. (1927), 83,523. There are silk and linen industries and an export of tobacco, walnut-wood, cocoons and vegetables for the Constantinople market.

See V. Guinet, *Turquie d'Asie* (Paris, 1890-1900).

ADAD, the name of the storm-god in the Babylonian-Assyrian pantheon, who is also known as Ramman ("the thunderer"). It seems that Ramman was the name current in Babylonia, whereas Adad was more common in Assyria. A god Hadad, a prominent deity in ancient Syria, is identical with Adad, whose name is therefore, an importation into Assyria from Aramaic

districts. Ramman is identical with Rimmon, known to us from the Old Testament as the chief deity of Damascus. The cult of a specific storm-god in ancient Babylonia is vouched for by the occurrence of the sign Im—the "Sumerian" for Adad-Ramman—as an element in proper names of the old Babylonian period. Through Aramaic influences in Babylonia and Assyria he was identified with the storm-god of the western Semites. The designation Amurru is also given to this god in the religious literature of Babylonia, which describes him as belonging to the Amorite district.

On the one hand he brings on the rain in due season, and causes the land to become fertile; on the other hand, by the storms that he sends, he brings havoc and destruction. He is pictured on monuments and seal cylinders with the lightning and the thunderbolt, and in the hymns the sombre aspects of the god on the whole predominate. His association with the sun-god, Shamash, imbues him with some of the traits belonging to a solar deity. In the theological lists he follows Shamash. At Erech in the south and Assur in the north Adad is intimately associated with Anu, the sky god. In Syria Hadad is hardly to be distinguished from a solar deity. In Babylonia and Assyria Shamash and Adad became in combination the gods of oracles and of divination in general. In the annals and votive inscriptions of the kings, when oracles are referred to, Shamash and Adad are always named as the gods addressed, and their ordinary designation in such instances is *bēlē bīri*, "lords of divination." The consort of Adad-Ramman is Shala, while as Amurru his consort is called Ashratum.

In magic rituals the symbol of Ramman is the cypress, and his sacred number is "six," consequently the sixth day of each month was sacred to him. The principal seat of the old Sumero-Babylonian cult of the thunder god was *Muru* (ki), which has not been located, and the cult is mentioned in connection with the cities Padda, Akus, Simurri and Halbaba, all unknown and certainly unimportant places; but a great temple to him and Anu has been excavated at Assur.

See the special study on this deity by Hans Schlobies, *Das akkadische Wettergott in Mesopotamien* (1925); also the article BABYLONIAN AND ASSYRIAN RELIGION.

ADAEV, a province of the autonomous Kazak (Kirghiz) S.S.R. Area 303,325sq.km. Pop. (1926) 136,000 (urban 3,012). The area includes the Ust Urt plateau (700ft.) in the south, and the low plain to the north of it which apparently once linked the Caspian and Aral seas, and which is studded with salt lakes with fauna bearing evidence of this link. The soil is either gravelly and stony desert or alkaline and gypsiferous grey soil, so that vegetation is sparse. The nomad Kirghiz tribes are mainly herdsmen. The administrative centre is Fort Alexandrovsk on the Mangishlak peninsula, which has a fishing industry (including seal fishery) and exports Glauber salts obtained from the shores of Kara Bugaz bay. On Mangishlak peninsula there is evidence of naphtha, ozokerite and bitumen deposits, as yet unworked (1928). In the north-west the province extends northward in a narrow strip nearly to lat. 50° N., and thus includes the naphtha area round Ulsk, where the population is mainly Russian and Tatar. Apart from this strip, the province is semi-desert; there is no railway.

ADAGIO, a term in music to indicate slow time; also a slow movement in a symphony, sonata, etc., or an independent piece, such as Mozart's pianoforte, "Adagio in B minor." The diminutive form *adagietto* means somewhat less slow than *adagio*.

ADAIR, JOHN (d. 1722), Scottish surveyor and map-maker of the 17th century. In 1703 he published the first part of his *Description of the Sea-coasts and Islands of Scotland*, for the use of seamen. The second part never appeared. Some of his work is preserved in the Advocates' Library (now the National Library of Scotland) at Edinburgh and in the King's Library of the British Museum, London.

ADALBERON or **ASCELIN** (d. 1030 or 1031), French bishop and poet, studied at Reims and became Bishop of Laon in 977. When Laon was taken by Charles, Duke of Lorraine, in 988, he was put into prison, whence he escaped and sought the

protection of Hugh Capet, King of France. Winning the confidence of Charles of Lorraine and of Arnulf, Archbishop of Reims, he was restored to his see; but he betrayed Laon, together with Charles and Arnulf, into the hands of Hugh Capet. He died on July 19, 1030 or 1031. Adalberon wrote a satirical poem in the form of a dialogue dedicated to Robert, King of France, in which he showed his dislike of Odilo, Abbot of Cluny, and his followers, and his objection to persons of humble birth being made bishops. The poem was first published by H. Valois in the *Carmen panegyricum in laudem Berengarii* (Paris, 1663), and in modern times by J. P. Migne in the *Patrologia Latina*, tome cxli. (Paris, 1844). Adalberon must not be confounded with his namesake, Adalberon, Archbishop of Reims (d. 988 or 989).

BIBLIOGRAPHY.—See Richer, *Historiarum libri iii. et iv.* which appears in the *Monumenta Germaniae historica, Scriptores*. Band iii. (Hanover and Berlin, 1826–92). A. Olleris, *Oeuvres de Gerbert pape sous le nom de Sylvestre II.* (Paris, 1867); *Histoire littéraire de la France*, tome vii. (Paris, 1865–69).

ADALBERT (c. 700), English saint, possibly a grandson of Oswald, king of Deira, was sent with St. Willibrord on a mission to the Frisians, and is said to have been the first archdeacon of Utrecht. In about 702 he went to preach in north Holland, where he built a church at Egmont. He is supposed to have died in 705, on June 25, and until the early 18th century that day was still kept sacred to his memory, as patron saint, in the village of Egmont. A life of Adalbert was compiled in the 10th century, by some monks in the diocese of Treves, and one by a monk at Egmont in the 12th century.

ADALBERT or **ADELBERT** (c. 1000–1072), German archbishop, was the son of Frederick, count of Goseck, a member of a noble Saxon family. Adalbert stood high in the favour of Henry III., whom he accompanied on many expeditions into Hungary, Italy, Slavonia and elsewhere. It is said that he might have been made Pope but that he saw greater possibilities of power and influence in northern Germany. In 1045 he was appointed archbishop of Hamburg-Bremen, his province including the Scandinavian countries, as well as the larger part of North Germany. He moved the seat of the bishopric from Bremen to Hamburg, sent missionaries to Finland, Greenland and the Orkney Islands, and aimed at making Bremen a patriarchal see for northern Europe, with 12 suffragan bishoprics.

He consolidated and increased the estates of the church, exercised the powers of a count, denounced simony, and initiated financial reforms. The presence of this powerful and active personality was greatly resented by the Saxon duke of the north, Bernard II., who regarded him as a spy sent by Henry. Adalbert gave substantial help to the emperor in the struggle with Baldwin, count of Flanders, by concluding a treaty (1049) with Sweyn of Norway and Denmark, who sent a fleet to the Netherlands coast. The archbishop's ambition to secure ecclesiastical control of northern Europe was furthered in 1052 by a papal brief which put all the Christians of the north, from the Icelanders in the west to the Finns in the east, under the see of Bremen. Adalbert himself became papal legate for the north. For a time his ecclesiastical pretensions estranged Sweyn, but in the end the Norwegian king acquiesced.

Adalbert, who wished to free his lands entirely from the authority of the duke, Bernard II., aroused hostility by an attack on the privileges of the great abbeys, and after the emperor's death in 1056 his lands were ravaged by Bernard. He took a leading part in the government of Germany during the minority of Henry IV., and was styled *patronus* of the young king, over whom he exercised considerable influence. Having accompanied him on a campaign into Hungary in 1063, he received large gifts of crown estates and obtained the office of count palatine in Saxony. His power aroused so much opposition that in 1066 the king was compelled to assent to his removal from court. In 1069 he was recalled by Henry, when he made a further attempt to consolidate a northern patriarchate, which failed owing to the hostility of the papacy and the condition of affairs in the Scandinavian kingdoms. He died at Goslar, and was buried in the cathedral which he had built at Bremen. Adalbert was a man of large ideas and a strong, energetic character. He fortified and improved

Bremen, and it was called the *New Rome* by his biographer, Adam of Bremen.

See Adam of Bremen, *Gesta Hammenburgensis ecclesiae pontificum*, edited by J. M. Lappenberg, in the *Monumenta Germaniae historica, Scriptores*, Band vii. (1826–92); C. Gruenhagen, *Adalbert Erzbischof von Hamburg und die Idee eines Nordischen Patriarchats* (1854).

ADALBERT, originally VOYTECH (c. 950–997), known as the apostle of the Prussians, the son of a Bohemian prince, was born at Libice (Lobnik, Lubik). He was educated at the monastery of Magdeburg; and in 983 was chosen bishop of Prague. The extreme severity of his rule repelled the Bohemians, whom he vainly strove to wean from their national customs and pagan rites. Discouraged by ill success, he withdrew to Rome until 993, when, in obedience to the Pope, he returned to his own people. Finding little amendment, however, in their course of living, he returned to Rome, and obtained permission from the Pope to devote himself to missionary labours in N. Germany and Poland. While preaching in Pomerania he was assassinated by a heathen priest.

See U. Chevalier, *Répertoire des sources historiques du moyen âge*, Bio.-Bibl. (1905); Bolland, *Acta Sanctorum*, April 23; H. G. Voigt, *Adalbert von Prag* (1898), a thoroughly exhaustive monograph.

ADALIA, the ancient *Attaleia* (q.v.) (med. *Antaliyah*; the crusaders' *Satalia*), the largest seaport on the south coast of Asia Minor, though in point of trade it is now second to Mersina. The unsuitability of the harbour for modern steamers, the bad anchorage outside and the extension of railways from Smyrna have greatly lessened its former importance as an emporium for west central Anatolia, although it retains considerable importance as the administrative capital of a rich and isolated vilayet. Adalia played a considerable part in the mediaeval history of the Levant. Kilij Arslan had a palace there. The army of Louis VII. sailed thence for Syria in 1148, and the fleet of Richard of England rallied there before the conquest of Cyprus. Conquered by the Seljuks of Konia, and made the capital of the province of Tekké, it passed after their fall through many hands, including those of the Venetians and Genoese, before its final occupation by the Ottoman Turks under Murad II. (1432). The port is served by coasting steamers of the local companies only. Adalia is an extremely picturesque, but ill-built and backward place. Pop. (1927) 38,780.

See C. Lanckoronski, *Villes de la Pamphylie et de la Pisidie*, i. (1890).

ADAM, the Hebrew word for "man"; when used without the article implying the human species (e.g., Gen. i. 26 and the familiar phrase "son" or "sons of man," i.e., a human being or human beings), with the article a human individual, corresponding generally to the Latin *homo* and the Greek *ἄνθρωπος*. (The absence of the article in Gen. ii. 20b and iii. 17 is probably accidental, being due to the vocalization of the Hebrew text, not to its original consonants.) But in Gen. ii. 25 and v. 1 it may be a proper name, applied to the first man created. It is certainly in this sense that the word is employed in Gen. v. 2–6, and so it has been generally used, in the popular language both of Jews and of Christians.

The narrative of Gen. i. in giving an account of the "creation" of man does not necessarily imply that a single pair only was thus formed at the first. Throughout that chapter the impression the reader receives is that a large number of individuals in each species come into being at once. This, however, in its present form, is the later of the two narratives of creation, though it is probably a revision of a very ancient tradition, going far back behind the earliest appearance of Israel as a nation, and based on that common stock of thought which spread from Mesopotamia over western Asia before the middle of the 2nd millennium B.C.

With the narrative in Gen. ii. 4–25—the earlier in its present form—the case is different. Here we have most certainly the theory that all humanity is sprung from a single pair, a "man" and his "woman." The narrative is naïve in its detail and elementary in its theology. There is no account of the creation of the earth, or speculation as to how it came into being; it is

assumed. There is, however, no life, whether animal or vegetable, and the ordinary processes of the weather have not yet begun. The clayey soil is moistened by "mist," and from this material "Yahweh," afterwards to be the God of Israel, models the figure of a man. Then He breathes into his nostrils, and so—breath being regarded as one of the primary "givers of life"—brings to life this earthen model. The next problem is what to do with this living toy, and Yahweh makes a proper home for him by planting a garden and making all kinds of useful trees grow in it. There is

AFTER A WOODCUT FROM "BERGOMENSIS, SUPPLEMENTUM CHRONICARUM," VENICE, 1492
EVE TEMPTING ADAM TO EAT THE FORBIDDEN FRUIT AND THEIR EXPULSION FROM THE GARDEN OF EDEN

more to be done; the man's needs are far from being satisfied, for he will require suitable companionship. It is not enough that he should exist alone, and experiment alone can show what will satisfy him.

Yahweh's first attempt at providing a suitable companion follows the method by which the man himself has been made. All kinds of forms are modelled from the wet clay, and brought before the man. At the sight of each he makes some sound, and the sound, expressing as it does the man's attitude towards the creature, becomes its name. But in no case does the name thus spontaneously given suggest that the problem is solved; the experiment has failed. Another method must be tried. Yahweh throws the man into an anaesthetic slumber and takes a rib from his side, carefully mending the place afterwards. Then He "builds" the rib into a form, and brings that to the man. Now he exclaims "wo-man," and the terms in which he greets the new figure show that at last the experiment is successful. Ultimately from this pair the whole human race descends.

Here, then, we have certain theories about human nature, held by the Israelite of the middle monarchy. Though the view of God is crude and anthropomorphic, yet it is clear that He is the author of man's being. Man's nature is bipartite—it is assumed that what is true of the common ancestor will be true of all his descendants. He consists of a body, made of the same kind of material as the soil from which all things spring, together with another element, a life-soul, which does not come from the ground, but is imparted by God Himself. The difference between the sexes is recognized, as also the fact that they are mutually complementary, but the sex instinct is at present undeveloped.

Other familiar features of human life are thus left unexplained. Man no longer lives in the garden, nor finds that the soil always yields a generous response to his efforts. The sex life is strongly developed and the subordination of woman is generally recognized. The hostility between man and other creatures, especially the snake tribe, needs explanation, and all these facts are accounted for in the second narrative, that of Gen. iii., commonly described as the story of the Fall.

Such is the Biblical story of the first man, and, apart from genealogies in Gen. iv. 25, v. 1-6, Chron. i. 1, he is never mentioned again by name in the Old Testament. The narrative has

affinities with others known to the ancient world, and the story of the Fall, at least, has a parallel in Ez. xxviii. Mesopotamians told of the formation of man from clay mingled with the blood of Bel, of Adapa, who narrowly missed attaining immortality, and of Ea-bani, made by Ishtar from clay, and seduced from his wild and primitive ways by a harlot. If all these have a common source with the Biblical narrative (which is quite possible), then we are more than ever impressed with the way in which the Hebrew genius for religion transmuted them, and, in spite of the crudities of language and thought, adapted them to universal religious experience.

Later thinkers and writers greatly expanded the story, and drew from it conclusions which were originally foreign to it. Rabbinic thought ascribed to Adam before the Fall a superhuman grandeur. One legend indeed, followed in the Koran, relates that all the angels were ordered to fall down and worship Adam, and that Satan refused, on the ground that he was made of fire and the man of clay. Others ascribed to Adam's fall the mortality of the human race, though in the original story there is no suggestion that man was originally created immortal. The doctrine of hereditary guilt appeared, and has formed the basis of much Christian theology. Apart from a single reference in Jude 14 and the mention of the name in the Lucan genealogy of Christ, St. Paul is the only New Testament writer who mentions Adam. He regards him as a type or summary of the whole human race in its natural state, and contrasts him and his kind with the new order of being that came into existence with Christ—"the second Adam," the originator of the higher spiritual plane. To him the "natural" man is, as to the old Hebrew, bipartite, consisting of "flesh" and "life"; the man who is in Christ has received a third element, the "Spirit." And to Pauline thought Christ is the starting point at which this third element first enters, just as the "Adam" of Gen. i.-v. is the starting point of the lower human order. (T. H. R.)

ADAM, the name of a family of French sculptors. **LAMBERT SIGISMUND** (1700-1759) executed many pieces for the French royal residences and for Frederick the Great of Prussia. **NICOLAS SÉBASTIEN**, his brother (1705-1778), was responsible for the tomb of Catherine Opalinska at Nancy. Another brother, **FRANÇOIS GASPARD BALTHASAR**, executed many of the monuments at Sans Souci and Potsdam.

See Dussieux, *Artistes français à l'étranger* (1855); Lady Dilke, *French Architects and Sculptors of the 18th century* (1900).

ADAM, ADOLPHE CHARLES (1803-1856), French composer of light operas which enjoyed great favour, was born in Paris July 24, 1803, and died there May 3, 1856. Boieldieu taught and encouraged him and he became in due course one of the most prolific and popular composers of his time. Of his 53 stage works *Le Postillon de Longjumeau* merits particular mention, while his ballet *Giselle* is still performed.

ADAM, ALEXANDER (1741-1809), Scottish teacher and antiquarian, was born on June 24, 1741 near Forres, Morayshire, and died in Edinburgh on Dec. 18, 1809. He became rector of Edinburgh High School in 1768, and had among his pupils many boys who afterwards became famous, among them Sir Walter Scott, Lord Brougham, and Jeffrey. He introduced Greek into the school curriculum, and defied tradition by publishing a *Principles of Latin and English Grammar* in English instead of Latin. His best-known work is his *Roman Antiquities* (1791).

See A. Henderson, *An Account of the Life and Character of A. A.* (1810).

ADAM, SIR FREDERICK (1781-1853), British general, fought during the Napoleonic wars from Egypt, in 1801, to Waterloo; afterwards he was high Commissioner of the Ionian Isles and governor of Madras.

ADAM, JULIETTE (1836-), French writer, known also by her maiden name of Juliette Lamber, was born at Verberie (Oise) Oct. 4, 1836. She has given an account of her childhood, rendered unhappy by the dissensions of her parents, in *Le Roman de mon enfance et de ma jeunesse* (Eng. trans., 1902). In 1852 she married a doctor named La Messine, and published in 1858 her *Idées antiproudhoniennes sur l'amour, la femme et le mariage*,

in defence of Daniel Stern (Mme. d'Agoult) and George Sand. On her husband's death she married, in 1868, Antoine Edmond Adam (1816-1877), prefect of police in 1870, and subsequently life-senator; and she established a salon which was frequented by Gambetta and the other republican leaders against the conservative reaction of the 'seventies. In the same interest she founded in 1879 the *Nouvelle Revue*, which she edited for the first eight years, and in the administration of which she retained a preponderating influence until 1899. She wrote the notes on foreign politics, and was unremitting in her attacks on Bismarck and in her advocacy of a policy of *revanche*. The famous *Lettres sur la politique extérieure* in this review are from her pen. Mme. Adam was also generally credited with a share in the authorship of papers on various European capitals signed "Paul Vassili." The most famous of her numerous novels is *Païenne* (1883). Her reminiscences, *Mes premières armes littéraires et politiques* (1904), *Mes sentiments et nos idées avant 1870* (1905), and later volumes in 1907, 1909 and 1910, contain much interesting gossip about her distinguished contemporaries. Mme. Adam saw the revolution of '48, the Second Empire, the Siege of Paris, the Treaty of Versailles, and lived to see the *revanche* she had fought and prayed for when the second Treaty of Versailles was signed in 1919. In her youth she had belonged to the anti-clerical Liberal Party, but in the disillusionments of her later days she moved with her time, and just as *Païenne* had reflected a free-thinking age, *Chrétienne* (1913) was a glorification of the Catholic tradition.

See W. Stephens, *Madame Adam, la grande française* (1917).

ADAM, MELCHIOR (d. 1622), German divine and biographer, wrote *Vitae Germanorum philosophorum* (Heidelberg-Frankfurt, 1615-20). Pierre Bayle acknowledges his debt to this work, which deals principally with German scholars of the 16th century.

ADAM, PAUL (1862-1920), French novelist, was born in Paris on Dec. 7, 1862, and died there on Jan. 2, 1920. He was prosecuted for his first novel, *Chair molle* (1885), but was acquitted. He collaborated with Jean Moréas in *Le thé chez Miranda* (1886), and with Moréas and Gustave Kahn he founded the *Symboliste*, coming forward as one of the earliest defenders of symbolism. Among his numerous novels should be noted *Le mystère des foules* (1895), a study in Boulangism, *Lettres de Malaisie* (1897), a fantastic romance of imaginary future politics. In 1899 he began a novel-sequence, giving the history of the Napoleonic campaigns, the restoration, and the government of Louis Philippe, comprising *La force* (1899), *L'enfant d'Austerlitz* (1901), *La ruse* (1902), and *Au soleil de Juillet* (1903). In 1900 he wrote a Byzantine romance, *Basile et Sophia*.

He was an indefatigable traveller, and in his later years much occupied with economic theory. *Le Trust* (1910) was the fruit of one of his journeys to America. Later books were *Stéphanie* (1918) and during the World War *Reims dévastée* and *Le Lion d'Arras*.

ADAM, ROBERT (1728-1792), British architect, the second son of William Adam of Maryburgh, in Fife, and the most celebrated of four brothers, John, Robert, James, and William Adam, was born at Kirkcaldy in 1728. He studied at the University of Edinburgh, and probably received his first instruction in architecture from his father, who gave proofs of his own skill and taste in the Edinburgh Royal Infirmary (now demolished). Somewhere between 1750 and 1754 he visited Italy, where he spent three years studying the remains of Roman architecture. There he was struck with the circumstance that practically nothing had survived of the Greek and Roman masterpieces except public buildings, and that the private palaces, which Vitruvius and Pliny esteemed so highly, had practically vanished. One example of such work, however, was extant in the ruins of Diocletian's palace at Spalato, in Dalmatia, and this he visited in July 1757, taking with him the famous French architect and antiquary, C. L. Clérissieu, and two experienced draughtsmen, with whose assistance, after being arrested as a spy, he managed in five weeks to accumulate a sufficient number of measurements and careful plans and surveys to produce a restoration of the entire

building in a fine work which he published in 1764, *The Ruins of the Palace of Diocletian, etc.* Adam regarded this as the last great achievement of Roman architecture, whereas to later students it appears to mark the beginning of the decadence. The influence of these studies was apparent directly and indirectly in much of his subsequent work, which, indeed, was in great measure founded upon them.

After his return to England he came rapidly to the front, and in 1762 he was appointed sole architect to the king and the Board of Works. Six years later he resigned this office, in which he was succeeded by his brother James—who, however, held the office jointly with another—and entered parliament for the county of Kinross. In 1768 he and his three brothers leased the ground fronting the Thames, upon which the magnificent terrace of the Adelphi, one of their greatest achievements, was built for £1,200 on a 99 years' lease. The Adelphi was still standing in 1928, though imminently in danger from rebuilding proposals. The site presented attractive possibilities. A steep hill led down Buckingham street to the river-side, and the plan was to raise against it, upon a terrace formed of massive arches and vaults and facing the river, a dignified quarter, of fine streets and stately buildings, suggestive of the Spalato ruins. Splendid, however, as the terrace and its houses are, both in conception and execution, the underground work which upholds them is perhaps more remarkable still. Between 1773 and 1778 the brothers issued a fine series of folio engravings and descriptions of the designs for many of their most important works, which included several great public buildings and numberless large private houses; a fine volume was published in 1822. For the remaining years of Robert's life the practice of the firm was the most extensive in the country; his position was unquestioned, and when he died in 1792 he was laid to rest in Westminster Abbey almost as a matter of course.

As an architect, Adam was strongly under Roman and Italian influences, and his style and aims were exotic rather than native. It was the signal triumph of his genius that he was able so to mould and adapt classical models as to create a new manner of the highest charm and distinction. Out of simple curvilinear forms, of which he principally preferred the oval, he evolved combinations of extraordinary grace and variety, and these entered into every detail of his work. In his view the architect was intimately concerned with the furniture and the decorations of a building as well as with its form and construction, and this view he carried rigorously into practice, and with astonishing success. But whatever care he might have expended upon the flowing curves of a moulding or a decoration, it was strictly kept in its place; it contributed its share and no more to the total effect. He imparted the unity of a single imposing structure to a number of private houses grouped in a block which is so characteristic a feature of modern town building. A delightful but theoretically undesirable characteristic of his work is the use of stucco. Upon it he moulded delicate forms in subtle and beautiful proportions. His "compo" was used so successfully that the patent was infringed; many of his moulds still exist and are in constant use. That most difficult feature, the column, he handled with enthusiasm and perfect mastery; he studied and wrote of it with minute pains, while his practice showed his grasp of the subject by all avoidance of bare imitation of the classic masters who first brought it to perfection. His work might be classic in form but it was independently developed by himself. It would be impossible here to give a list of the innumerable works which he executed. In London, of course, the Adelphi stands pre-eminent; the screen and gate of the Admiralty and part of Fitzroy square are by him, and much of the older portion of Finsbury circus, besides whole streets of houses in the west end. There are the famous country houses of Lord Mansfield at Kenwood (Highgate) and Luton Hoo, and decorations and additions to many more.

Robert Adam—with, there is reason to suspect, some help from his brother James—has left as deep and enduring a mark upon English furniture as upon English architecture. Robert Adam was no doubt at first led to turn his thoughts towards furniture by his desire to see his light, delicate, graceful interiors, with their large

sense of atmosphere and their refined and finished detail, filled with plinishings which fitted naturally into his scheme. His own taste developed as he went on, but he was usually extremely successful, and cabinet-makers are still reproducing his most effective designs. In his furniture he made lavish use of his favourite decorative motives—wreaths and paterae, the honeysuckle, and that fan ornament which he used so constantly. Thus an Adam

FROM BOLTON, "ARCHITECTURE OF R. AND J. ADAM," BY PERMISSION OF "COUNTRY LIFE"
A CHARACTERISTIC MANTELPIECE BY ROBERT ADAM IN THE ADELPHI.
DETAIL OF ADAM DRAWING-ROOM CEILING IN GARRICK'S HOUSE, ADELPHI

house is a unique product of English art. From façade to fire-irons, from the chimneys to the carpets, everything originated in the same order of ideas, and to this day an Adam drawing-room is to English what a Louis Seize room is to French art. In nothing were the Adams more successful than in the fine proportions of their mantelpieces and doors. The former, by reason of their simplicity and the readiness with which the "compo" ornaments can be applied and painted, are still made in cheap forms in great number.

John Adam succeeded to his father's practice as an architect in Edinburgh. James Adam studied in Rome, and eventually was closely associated with Robert; William is variously said to have been a banker and an architect.

See John Swarbrick, *Robert Adam and his brothers* (1916); Arthur T. Bolton, *Architecture of Robert and James Adam* (1922). Both are illustrated. Mr. Bolton's book contains photographs of many Adam houses, and of many Adam interiors. Among country houses, Hatchlands, Shardeloes, Harewood House, Bowood, Kedleston, Syon House and Kenwood; among the great houses of London, Lansdowne House, and of many public and private buildings in Scotland.

ADAM, WILLIAM (1751-1839), British lawyer and politician, was a Whig and a supporter of the policy of Fox. At the English bar he obtained a very considerable practice. He was successively attorney and solicitor-general to the Prince of Wales, one of the managers of the impeachment of Warren Hastings, and one of the counsel who defended the first Lord Melville when impeached.

ADAMANT, the modern diamond (*q.v.*), but also a name given to any very hard substance (Gr. *ἀδάμας*, untameable). The word is used by Homer as a personal epithet, and by Hesiod for the hard metal in armour. By confusion with the Lat. *adamare*, to have an attraction for, it came to be associated with the load-stone; but since the term was displaced by "diamond" it has had only a figurative and poetical use.

ADAMAWA, a country of West Africa, which lies roughly between 6° and 11° N., and 11° and 15° E., about midway between the Bight of Biafra and Lake Chad. The region is watered by the Benue, a tributary of the Niger. Another stream, the Vedseram, flows north-east of Lake Chad. The most fertile parts of the country are the plains near the Benue, about 800ft. above the sea. South and east of the river a much dissected plateau rises to an elevation of 1,600ft. Mount Alantika (6,000ft.), about 25m. south-south-east of Yola, is a conspicuous granite mass. The country, which is very fertile and covered with luxuriant vegetation, has many villages and a considerable population. Durra, ground-nuts, yams and cotton are the principal products, and the palm and banana abound. Elephants are numerous and ivory is exported. In the eastern part of the country the rhinoceros is met with, and the rivers swarm with crocodiles.

Adamawa is named after a Fula emir, Adama, who in the early years of the 19th century conquered the country. To the Hausa and Bornuese it was previously known as Fumbina (or Southland). The inhabitants are mainly pure negroes such as the Durra, Batta and Dekka, speaking different languages, and all fetish-worshippers. Slave-trading was still active among them in the early years of the 20th century. The Fula (*q.v.*), who first came into the country about the 15th century as nomad herds-men, are found chiefly in the valleys, the pagan tribes holding the mountainous districts. There are also in the country numbers of Hausa, who are chiefly traders, as well as Arabs and Kanuri from Bornu. The exploration of the region during the 19th century was mostly in the hands of the Germans. The emir of Yola, in the period of Fula lordship, claimed rights of suzerainty over the whole of Adamawa, but the country, since the subjection of the Fula (*c.* 1900), has consisted of a number of small states under the control of the British, Germans and French. It is now administered, partly under French Equatorial Africa, and partly under the British Protectorate of Nigeria. Garua on the Upper Benue and Ngaundere are the chief towns.

See Heinrich Barth, *Travels in North and Central Africa* (new edit., 1890); S. Passarge, *Adamawa* (Berlin, 1895). See also FRENCH EQUATORIAL AFRICA and NIGERIA.

ADAM (or ADAN) DE LE HALE (*c.* 1238-1288), French troubadour, was born at Arras. His patronymic is generally modernized to La Halle, and he was commonly known to his contemporaries as Adam d'Arras or Adam le Bossu, sometimes simply as Le Bossu d'Arras. Adam studied grammar, theology and music at the Cistercian abbey of Vaucelles, near Cambrai. He joined the household of Robert II., count of Artois in 1272; and from 1283 was attached to Charles of Anjou, brother of Charles IX., whose fortunes he followed in Egypt, Syria, Palestine and Italy. At the court of Charles, after he became king of Naples, Adam wrote his *Jeu de Robin et Marion*, the most famous of his works. He died between 1285 and 1288. Adam's shorter pieces are accompanied by music, of which a transcript in modern notation, with the original score, is given in Coussemaker's edition.

His *Jeu de Robin et Marion* is cited as the earliest French play with music on a secular subject, and on the strength of it he has been dubbed by some the father of opéra-comique. It takes the form of a dramatic pastoral introducing a number of characters and consists of a dialogue varied by refrains already current in popular song. The melodies to which these are set have the character of folk-music, and are more spontaneous and melodious than the more elaborate music of his songs and motets. A modern adaptation, by Julien Tiersot, is occasionally performed. Another of his plays, *Le jeu Adan* or *Le jeu de la Feuillée* (*c.* 1262), was a satirical drama in which he introduced himself, his father and the citizens of Arras, with their peculiarities. His works include further a *Congé*, or satirical farewell to the city of Arras, and an

unfinished *chanson de geste* in honour of Charles of Anjou, *Le roi de Sicile*, begun in 1282.

BIBLIOGRAPHY.—The only MS. which contains the whole of Adam's work is the La Vallière MS. (No. 25, 566) in the Bibliothèque Nationale, Paris, dating from the latter half of the 13th century. Many of his pieces are also contained in Douce MS. 308, in the Bodleian Library, Oxford. His *Oeuvres complètes* (1872), were edited by E. de Coussemaker. See J. Tiersot, *Sur le jeu Robin et Marion* (1898); L. Nicod, *Les Partures Adam, Les Jeux partis d'Adam de la Halle* (1917); and, for full bibliography of works on the subject, No. 6, of the *Bibliothèque de bibliographies critiques*, by Henri Guy.

ADAMITES or ADAMIANS, a sect of heretics that flourished in North Africa in the 2nd and 3rd centuries. Basing itself probably on a union of certain gnostic and ascetic doctrines, this sect pretended that its members were re-established in Adam's state of original innocence.

ADAMNAN or ADOMNAN (c. 624–704), Irish saint and historian, was born at Raphoe, Donegal, Ireland. In 679 he was elected abbot of Hy or Iona, being ninth in succession from the founder, St. Columba. In 686, while on a visit to King Aldfrith of Northumbria he was led to adopt the Roman rules on the date of Easter and on the tonsure, but failed to enforce the change upon his monks.

We owe to Adamnan two valuable works, the anecdotic *Life of St. Columba*, preserving the authentic traits of the saint, and the *De locis sanctis*, an account of Arculf's travels in the Holy Land, which, in the longer version of Bede, was a kind of guide-book to the holy places in Palestine throughout the middle ages.

Adamnan is sometimes credited with *Adamnan's Vision*, the Irish version of which is in a 12th century MS. in Dublin.

BIBLIOGRAPHY.—Thirteen MSS. of the original Arculf-Adamnan narrative exist, and fully 100 of Bede's abridgment of the former; the most important, containing all the plans, are (1) Berne, Canton Library, 582, of 9th century; (2) Paris, National Library, Lat. 13,048, of 9th century; a third ms., London, Brit. Mus., Cotton, Tib. D.V., of 8th–9th centuries, though damaged by fire and lacking the illustrations, is of value for the text, being the oldest of all. The best edition is that of Tobler in *Itinera et Descriptiones Terrae Sanctae* (1877); we may also mention that of 1870, by Delpit, in his *Essai sur les anciens pèlerinages à Jérusalem*. See further Delpit's remarks upon Arculf in the same work, 260–304; Beazley, *Dawn of Modern Geography*, i. 131–41 (1897), and J. L. Macpherson, *Arculfus' Pilgrimage to the Holy Land* (1899). The *Life of St. Columba* was edited by J. T. Fowler (1894).

ADAM OF BREMEN (died c. 1076), historian and geographer, was, according to one tradition, born at Meissen (Saxony) before 1045. In 1069 he appears as a canon of Bremen and master of the cathedral school. On the death of Adalbert, archbishop of Bremen, in 1072, he began the *Historia Hammaburgensis Ecclesiae*, which he finished about 1075. Adam's *Historia*—known also as *Gesta Hammaburgensis Ecclesiae Pontificum*, *Bremensium praesulum Historia*, and *Historia ecclesiastica*—is a primary authority, not only for the great diocese of Hamburg-and-Bremen, but for all North German and Baltic lands (down to 1072), and for the Scandinavian colonies as far as America.

Here occurs the earliest mention of Vinland, and here are also references of great interest to Russia and Kiev, to the heathen Prussians, the Wends and other Slav races of the South Baltic coast, as well as to Finland, Thule or Iceland, Greenland and the Polar seas, which Harald Hardrada and the nobles of Frisia had attempted to explore in Adam's own day (before 1066). Adam's account of North European trade at this time, and especially of the great markets of Jumne at the mouth of the Oder, of Birka in Sweden and of Ostrogard (Old Novgorod?) in Russia, is also of much value.

His work, which places him among the first and best of German annalists, consists of four books or parts, and is compiled partly from written records, and partly from oral information mainly gathered from experience or at the courts of Adalbert and Sweyn Estrithson, king of Denmark. Of his minor informants he names several, such as Adelward, dean of Bremen, and William the Englishman, "bishop of Zealand," formerly chancellor of Canute the Great, and an intimate of Sweyn Estrithson. The fourth (perhaps the most important) book of Adam's *History*, variously

entitled *Libellus de Situ Daniae et reliquarum quae trans Daniam sunt regionum*, *Descriptio Insularum Aquilonis*, etc., has often been considered, but wrongly, as a separate work.

BIBLIOGRAPHY.—Ten MSS. exist, of which the chief are (1–2) Copenhagen, Royal Library, Old Royal Collection, No. 2296, of 12th to 13th cents.; No. 718, of 15th cent.; (3) Leyden University, Voss. Lat. 123, of 11th cent.; (4) Rome, Vatican Library, 2010; (5) Vienna, Hof-u. Staatsbibliothek, 413, of 13th cent.; (6) Wolfenbüttel, Ducal Library, Gud. 83, of 15th cent. There are 15 editions of the *Historia*, in whole or part; the first published at Copenhagen, 1579 (the first of the *Libellus* or *Descriptio Ins. Aquil.* appeared at Stockholm in 1615), the best at Hanover (1846, by Lappenberg, in *Scriptores Rerum Germanicarum*; re-issued by L. Weiland, 1876), and at Paris, 1884 (in Migne's *Patrologia Latina*, cxlvi.). See also Beazley, *Dawn of Modern Geography*, ii. 514–48 (1901).

ADAMS, ABIGAIL SMITH (1744–1818), wife of John Adams (q.v.), second President of the United States, was born in Weymouth, Mass., on Nov. 23, 1744. She was the daughter of William Smith, a Congregational minister, and was descended through her mother, Elizabeth Quincy, from Thomas Shepard of Cambridge, a noted Puritan divine. Despite scanty education and delicate health, she became a terse and vigorous writer and exercised much influence on the social and political life of her time. In 1764 she was married to John Adams, then practising law in Boston. During the first ten years of this union she lived in peace and quiet, though always ardently sharing her husband's interests in the growing disputes that culminated in war. In this period she became the mother of a daughter and three sons, one of whom, John Quincy Adams, rose to the presidency of the United States. But during the second ten years of married life she was practically separated from her husband, who was absent attending Congress and serving on diplomatic missions in Europe. She resolutely supported him in his insistence upon the Declaration of Independence and aided him and his cause with loyal zeal during the many dark days that followed. In 1784 she rejoined her husband in France and in 1785 accompanied him to England, where, as the wife of the first minister of the United States, she then but newly lost American colonies, to the court of George III., she met with social discourtesies which she long resented. From 1789 to 1801, when her husband was successively vice president and president, she lived in a simple manner in Washington. Since the publication by C. F. Adams in 1876 of *The Familiar Letters of John Adams and his Wife* increased interest has centred in the career of the stout-hearted Puritan woman who was both the wife and the mother of a President of the United States. She died at Braintree, now Quincy, Mass., on Oct. 28, 1818.

ADAMS, ANDREW LEITH (1827–1882), Scottish naturalist and palaeontologist. An army surgeon, he studied natural history in India and Kashmir, in Egypt, Malta, Gibraltar and Canada; and his observations on the fossil vertebrata of the Maltese Islands made him a recognized authority on fossil elephants.

See his *Notes of a Naturalist in the Nile Valley and Malta* (London, 1870), and *Monograph on the British Fossil Elephants* (Palaeontographical Soc.) (London, 1877–81).

ADAMS, CHARLES CHRISTOPHER (1873–), American zoologist, born in Clinton, Ill., July 23, 1873. He graduated from Illinois Wesleyan university in 1895, received the degree of master of science from Harvard university in 1899 and of doctor of philosophy from the University of Chicago in 1908. He was assistant in biology at Illinois Wesleyan university in 1895–96, assistant entomologist in the Illinois State Laboratory of Natural History in 1896–98, curator of the museum, University of Michigan, in 1903–06, and director of the Cincinnati Society of Natural History in 1906–07. From 1908 to 1914 he was associate in animal oecology in the University of Illinois, and from 1914 to 1926 assistant professor and professor of forest zoology in the New York college of forestry, and from 1919 to 1926 director of the Roosevelt Wild Life Experiment station, both at Syracuse, New York. In 1926 he was appointed director of the New York State museum, Albany, New York. His published writings

include *Guide to the Study of Animal Ecology* (1914) and numerous articles on faunas, habitats and associations, especially of prairies, lakes and forests, migration, geographical distribution and the relation of animal oecology to state and national parks.

ADAMS, CHARLES FOLLEN (1842-1918), American humorous poet, was born in Dorchester, Mass., April 21, 1842. He received a common school education. Early in the Civil War he entered the Union army and at Gettysburg was wounded and taken prisoner. In 1872 he began writing verses in German dialect, chiefly humorous, for juvenile periodicals. Collections of his verse were published under the title *Leedle Yawcob Strauss, and Other Poems* (1877) and *Dialect Ballads* (1887). His complete poetical writings under the title *Yawcob Strauss, and Other Poems*, with illustrations by "Boz," were published in 1910. He died in Boston, Mass., March 8, 1918.

ADAMS, CHARLES FRANCIS (1807-1886), American diplomatist, son of John Quincy Adams, and grandson of John Adams, was born in Boston (Mass.) Aug. 18, 1807. His father, having been appointed minister to Russia, took him in 1809 to St. Petersburg, where he acquired a perfect familiarity with French, learning it as his native tongue. After eight years spent in Russia and England, he attended the Boston Latin school for four years, and in 1825 graduated at Harvard. He lived for two years in the executive mansion, Washington, during his father's presidential term, studying law and moving in a society where he met Webster, Clay, Jackson and Randolph. Returning to Boston, he devoted ten years to business and study, and wrote for the *North American Review*. He also undertook the management of his father's pecuniary affairs, and actively supported him in his contest in the House of Representatives for the right of petition and the anti-slavery cause. In 1835 he wrote an effective and widely read political pamphlet, entitled, after Edmund Burke's more famous work, *An Appeal from the New to the Old Whigs*. He was a member of the Massachusetts general court from 1840 to 1845, sitting for three years in the House of Representatives and for two years in the Senate; and in 1846-48 he edited a party journal, the *Boston Whig*. In 1848 he was prominent in politics as a "Conscience Whig," presiding over the Buffalo convention which formed the Free Soil party and nominated Martin Van Buren for president and himself for vice-president. He was a Republican member of the 36th Congress, which assembled Dec. 5, 1859, and during the second session (Dec. 3, 1860-March 4, 1861) he represented Massachusetts in the Congressional Committee of 33 at the time of the secession of seven of the Southern states. His selection by the chairman of this committee, Thomas Corwin, to present to the full committee certain propositions agreed upon by two-thirds of the Republican members and his calm and able speech of Jan. 31, 1861, in the House served to make him conspicuous before Congress and the country. Together with William H. Seward, he stood for the Republican policy of concession; and, while he was criticized severely and charged with inconsistency in view of his record as a "Conscience Whig," he was of the same mind as President Lincoln, willing to concede non-essentials, but holding rigidly to the principle, properly understood, that there must be no extension of slavery. He believed that as the Republicans were the victors they ought to show a spirit of conciliation, and that the policy of righteousness was likewise one of expediency, since it would have for its result the holding of the border slave states with the North until March 4, when the Republicans could take possession of the government at Washington. With the incoming of the new administration, Secretary Seward secured for Adams the appointment of minister to Great Britain. So much sympathy was shown in England for the South that his path was beset with difficulties; but his mission was to prevent the interference of Great Britain in the struggle; and while the work of Lincoln, Seward and Sumner, and the cause of emancipation, tended to this end, the American minister was insistent and unyielding, and knew how to present his case forcibly and with dignity. He laboured with energy and discretion to prevent the sailing of the "Alabama"; and, when unsuccessful in this, he persistently urged upon the British Government its responsibility for the destruction of American merchant vessels by the privateer. In his own diary

he shows that underneath his calm exterior was keen anxiety. Adams was instrumental in getting Lord John Russell to stop the "Alexandra," and to order the detention in Sept. 1863 of the two ironclad rams intended for the Confederate States. Adams remained in England until May 1868. His last important work was as a member, in 1871-72, of the tribunal at Geneva which settled the "Alabama" claims. He died at Boston, Nov. 21, 1886.

He edited the works of *John Adams* (1850-56), and the *Memoirs of John Quincy Adams* (1874-77). See the excellent biography (Boston, 1900) by his son, Charles Francis Adams, Jr., and E. W. Adams, *Great Britain and the American Civil War* (1925).

ADAMS, CHARLES FRANCIS (1866-), Secretary of the Navy in President Hoover's cabinet, was born in Quincy, Mass., August 2, 1866, great-grandson of John Quincy Adams, 6th President, and great-great-grandson of John Adams, 2nd President of the United States; A.B., Harvard, 1888; LL.B., 1892; admitted to Suffolk bar 1893. He was a member of Quincy City Council, 1893-1895; mayor, 1896-1897; treasurer of Harvard College, 1898-1929; amateur skipper on yacht "Resolute," which won the International Yacht Races, 1920; appointed Secretary of the Navy, March 5, 1929. He was a member of the American delegation at the London Naval Conference, 1930.

ADAMS, CHARLES KENDALL (1835-1902), American educator and historian, was born in Derby, Vt., on Jan. 24, 1835. He graduated in 1861 at the University of Michigan, where he was instructor of history in 1862, assistant professor of history in 1863-67 and professor of history in 1868-85. From 1885 to 1892 he was president of Cornell university, succeeding A. D. White (q.v.), and from 1892 to 1902 he was president of the University of Wisconsin. He edited *Representative British Orations* (1884). His published works include *Democracy and Monarchy in France* (1874) and *Christopher Columbus* (1892). He died in Redlands, Calif., on July 26, 1902.

See Charles Foster Smith, *Charles Kendall Adams* (1924).

ADAMS, CLEMENT (1519?-1587), English author. He is supposed to have been tutor to the royal pages at Greenwich. His *Anglorum Navigatio ad Moscovitas* is an account of the journey to Moscow made by Chancellor and Willoughby in 1553, and an English translation was printed by Hakluyt in his *Principal Navigations*, vol. i. (1598).

ADAMS, EPHRAIM DOUGLASS (1865-), American educator and historian, brother of Henry Carter Adams (q.v.), was born in Decorah, Ia., Dec. 18, 1865. He graduated in 1887 from the University of Michigan from which in 1890 he received the degree of doctor of philosophy. From 1891 to 1899 he was assistant and associate professor of history and sociology, and from 1899 to 1902 professor of European history in the University of Kansas. He was associate professor of history in Leland Stanford university from 1902 until 1906, when he was made professor.

His published writings include *Control of the Purse in the United States Government* (1894), *The Influence of Grenville on Pitt's Foreign Policy* (1904), *British Interests and Activities in Texas* (1910), *The Power of Ideals in United States History* (1913), *Great Britain, America and Democracy* (1919), *Great Britain and the American Civil War* (1925) and numerous papers and reviews in historical journals.

ADAMS, FREDERICK UPHAM (1859-1921), American author and industrial engineer, was born in Boston, Mass., on Dec. 10, 1859. He removed to Elgin, Ill., and graduated at the high school there in 1876. He then studied mechanical engineering, which he practised from 1882 to 1890. In 1886 he invented an electric lamp-post, and in 1887 devised a form of electric light tower. He wrote books on engineering and on social subjects and also novels. He died in Larchmont, N.Y., on Aug. 28, 1921.

Among his works are: *Atmospheric Resistance and its Relation to the Speed of Railway Trains* (1893); *President John Smith* (1896); *The Kidnapped Millionaires* (1901); *John Burt* (1903); *How Cities are Governed in Great Britain* (1904); *John Henry Smith* (1905); *The Bottom of the Well* (1905); *The Revolt* (1907); *The Vegetarians*, a drama (1911); *Ramley*, a drama (1911); *The Conquest of the Tropics* (1914); *The Romance of Big Business* (1915); *The Open Shop* (1919).

ADAMS, GEORGE BURTON (1851-1925), American educator and historian, was born in Fairfield, Vt., June 3, 1851.

He graduated from Beloit college, Beloit, Wis., in 1873, and received the degree of doctor of philosophy from the University of Leipzig, Germany, in 1886. He was professor of history in Drury college, Springfield, Mo., from 1877 to 1888, when he became professor of history at Yale. From 1895 to 1913 he was editor of the *American Historical Review*. He edited Duruy's *Middle Ages*, Bémont and Monod's *Mediaeval Europe*, and *Select Documents of English Constitutional History*. He died in New Haven, Conn., May 26, 1925.

His published works include *Civilization During the Middle Ages* (1894), *The Growth of the French Nation* (1896), *European History* (1899), *The Origin of the English Constitution* (1912), *Outline Sketch of English Constitutional History* (1918), *The British Empire* (1919) and *The Constitutional History of England* (1921).

ADAMS, HANNAH (1755-1831), American writer, was born in Medfield, Mass., in 1755. She is said to be the first woman in America to have made literature a profession. By private study, which she began at an early age, she acquired much varied learning, including some acquaintance with Latin and Greek. Through family reverses she was compelled from her 17th year to provide for herself. Her writings, though they brought reputation and friends, yielded but little pecuniary profit. Among her chief works were *Views of Religious Opinions* (1784), *History of New England* (1799), *Evidences of Christianity* (1801) and *History of the Jews* (1812). Her *Autobiography*, with additions by Hannah F. Adams, was published in 1832. She died in Brookline, Mass., Nov. 15, 1831.

ADAMS, HENRY (1838-1918), American historian, son of Charles Francis Adams and grandson of John Quincy Adams, was born in Boston, Mass., on Feb. 16, 1838. He graduated at Harvard in 1858, studied abroad, and was private secretary to his father when the latter was a congressman and minister to England. Thereafter for a brief time he did political writing in Washington; and from 1870 to 1877 he was assistant professor of history at Harvard, for most of the period also acting as editor of the *North American Review*. He is considered to have been the first to conduct historical seminary work in the United States. His *History of the United States from 1801 to 1817* (9 vols. 1889-91, new ed. 1909) took its place as the best work on the administrations of Presidents Jefferson and Madison, being specially notable for its account of the diplomatic relations of the United States during this period, and for its essential impartiality. This, like his other historical and biographical works such as the *Life of Albert Gallatin* (1879), *John Randolph* (1882), *Historical Essays* (1891), and *Chapters of Erie and Other Essays* (1871, with Charles Francis Adams, Jr.), won him a reputation among scholars. His *Mont Saint Michel and Chartres* (1913, privately printed 1904) and *The Education of Henry Adams* (1918, privately printed 1906) revealed him to a much wider audience as a writer of delicate sensibilities and refined taste. *Mont Saint Michel and Chartres* is one of the most valuable studies of mediævalism yet produced in America, not only for the aid which it affords in the appreciation of the literary and architectural monuments of the past, but for the conception which it gives of the animating forces which produced these monuments. The autobiography which attempted to show how ill-adapted eighteenth-century man and education were for the needs of the twentieth century was one of the most widely discussed books of its decade in America. Correlating with these books to a certain extent was Adams's *Letter to American Teachers of History* (1910). He died in Washington on May 27, 1918. Posthumous publications were *The Degradation of the Democratic Dogma* (1919, with an introduction by Brooks Adams) and *Letters to a Niece and Prayer to the Virgin of Chartres* by Henry Adams, with *A Niece's Memories* by Mabel La Farge (1920). After his death he was named by Henry Holt as the author of *Democracy*, an anonymous novel of 1880.

His elder brother, JOHN QUINCY ADAMS (1833-1894), a graduate of Harvard (1853), practised law, and was for several terms a Democratic member of the Massachusetts general court. In 1872 he was nominated for vice president by the Democratic faction that refused to support Horace Greeley.

Another brother, CHARLES FRANCIS ADAMS, JR. (1835-1915),

born in Boston, on May 27, 1835, graduated at Harvard in 1856, and was admitted to the bar in 1858. During the Civil War he served on the Union side, receiving, in 1865, the brevet of brigadier general. He was president of the Union Pacific railroad from 1884-90, having previously become widely known as an authority on the management of railways. In 1900-01 he was president of the American Historical Association. He died in Washington, D.C., on March 20, 1915. His autobiography was published in 1916 with a memorial address by Henry Cabot Lodge.

Among his writings are: *Railroads, Their Origin and Problems* (rev. ed. 1887); *Three Episodes of Massachusetts History* (1892); a biography of his father, *Charles Francis Adams* (1900); *Lee at Appomattox and Other Papers* (1902); *Three Phi Beta Kappa Addresses* (1907); *Studies Military and Diplomatic 1775-1865* (1911); and *Atlantic Historical Solidarity* (1913), lectures delivered at Oxford.

Another brother, BROOKS ADAMS (1848-1927), was born in Quincy, Mass., on June 24, 1848, graduated at Harvard in 1870, and until 1881 practised law. He died in Boston, Feb. 13, 1927.

His writings include: *The Emancipation of Massachusetts: The Dream and the Reality* (rev. ed. 1919); *The Law of Civilization and Decay* (1895); *America's Economic Supremacy* (1900); and *The New Empire* (1902).

ADAMS, HENRY CARTER (1852-1921), American economist, was born at Davenport, Ia., Dec. 31, 1852. He was educated at Iowa college and Johns Hopkins university, where he was a fellow 1876-78, and in French and German universities. He afterwards taught at Cornell university, and in 1887 became professor of political economy and finance in the University of Michigan. He also became statistician to the Interstate Commerce Committee and was in charge of the transport department in the 1900 census. His principal works include *The State in Relation to Industrial Action* (1887); *Public Debts* (1887); *The Science of Finance* (1888); *Economics and Jurisprudence* (1897); *Description of Industry* (1918) and *American Railway Accounting* (1918). He died Aug. 11, 1921.

ADAMS, HERBERT (1858-), American sculptor, was born at West Concord (Vt.) on Jan. 28, 1858. He was educated

BY COURTESY OF GRAND CENTRAL GALLERIES

MAVERA" SHOWS A LEANING
TOWARD THE ITALIAN "QUATTRO-
CENTO" AND THE WORK OF THE
DELLA ROBBIAS

at the Worcester Institute of Technology and at the Massachusetts normal art school, and in 1885-90 he was a pupil of Antonin Mercié in Paris. In 1890-98 he was an instructor in the art school of Pratt institute, Brooklyn, New York. In 1906 he was elected vice-president of the National Academy of Design, New York, and from 1917-20 served as president. He experimented successfully with some polychrome busts and tinted marbles, notably in the "Rabbi's Daughter" and a portrait of Julia Marlowe, the actress. He was at his best in his portrait busts of women, the finest example being the study, completed in 1887, of Miss A. V. Pond, whom he afterwards married. Among his other productions are a fountain for Fitchburg (Mass., 1888); a number of works for the Congressional library, Washington, including the bronze doors ("Writing") begun by Olin Warner, and the statue of Prof. Joseph Henry; memorial tablets for the Boston State House; a memorial of Jonathan Edwards at Northampton (Mass.); statues of Richard Smith, the type-founder, in Philadelphia, and of William Ellery Channing, in Boston (1902); the Vanderbilt memorial bronze doors for St. Bartholomew's church, New York; the group of figures for McMillan fountain in McMillan park, Washington (D.C.); and the reliefs for the tomb of Ellen Axson Wilson (Mrs. Woodrow Wilson).

ADAMS, HERBERT BAXTER (1850-1901), American historian and educationalist, was born at Shutesbury (Mass.) on April 16, 1850. He graduated at Amherst, at the head of his class,

in 1872; and after studying at Göttingen and Berlin he received the degree of Ph.D. at Heidelberg in 1876, with the highest honours. Thereafter almost until his death he was connected with the Johns Hopkins university, Baltimore (Md.), becoming professor of American and institutional history in 1891. He was one of the founders of the American Historical Association, of which he was secretary until 1900. In 1882 he founded the "Johns Hopkins University Studies in Historical and Political Science," of which he became editor. It was as a teacher, however, that Adams rendered his most valuable services, and many American historical scholars owe their training, and to a considerable extent their enthusiasm, to him. He died at Amherst (Mass.) on July 30, 1901. Among his writings are: *Maryland's Influence in Founding a National Commonwealth* (1877); *Methods of Historical Study* (1884); *Maryland's Influence upon Land Cessions to the United States* (1885); and the *Life and Writings of Jared Sparks* (1893).

See *Herbert B. Adams: Tributes of Friends* (1902); extra vol. (xxiii.) of "Studies in Historical and Political Science."

ADAMS, JOHN (1735-1826), second president of the United States of America, was born Oct. 30, 1735, in what is now the town of Quincy (Mass.). His father, a farmer, also named John, was of the fourth generation in descent from Henry Adams, who emigrated from Devonshire, England, to Massachusetts about 1636; his mother was Susanna Boylston Adams. Young Adams graduated from Harvard college in 1755, and for a time taught in school at Worcester and studied law in the office of Rufus

BIRTHPLACE OF JOHN ADAMS, SECOND PRESIDENT OF THE UNITED STATES OF AMERICA, AT QUINCY, MASS.

Putnam. In 1758 he was admitted to the bar. From an early age he developed the habit of writing descriptions of events and impressions of men. The earliest of these is his report of the argument of James Otis in the superior court of Massachusetts as to the constitutionality of writs of assistance. This was in 1761, and the argument inspired him with zeal for the cause of the American colonies. Years afterwards, when an old man, Adams undertook to write out at length his recollections of this scene; it is instructive to compare the two accounts. John Adams had none of the qualities of popular leadership which were so marked a characteristic of his second cousin, Samuel Adams; it was rather as a constitutional lawyer that he influenced the course of events. He was impetuous, intense and often vehement, unflinchingly courageous, devoted with his whole soul to the cause he had espoused; but his vanity, his pride of opinion and his inborn contentiousness were serious handicaps to him in his political career. These qualities were particularly manifested at a later period—as, for example, during his term as president. He first made his influence widely felt and became conspicuous as a leader of the Massachusetts Whigs during the discussions with regard to the Stamp Act of 1765. In that year he drafted the instructions which were sent by the town of Braintree to its representatives in the Massachusetts legislature, and which served as a model for other towns in drawing up instructions to their representatives; in Aug. 1765 he contributed anonymously four notable articles to the *Boston Gazette* (republished separately in London in 1768 as *A Dissertation on the Canon and Feudal Law*), in which he argued that the opposition of the colonies to the Stamp Act was a part of the never-ending struggle between individualism and corporate authority; and in Dec. 1765 he delivered a speech before the governor and council in which he pronounced the Stamp Act invalid on the ground that Massachusetts, being without representation in parliament, had not assented to it. In 1768 he removed to Boston. Two years later, with that degree of moral courage which was one of his distinguishing characteristics, as it has been of his descendants, he, aided by Josiah Quincy, Jr., defended the British soldiers who were arrested after the "Boston Massacre," charged with caus-

ing the death of four persons, inhabitants of the colony. The trial resulted in an acquittal of the officer who commanded the detachment, and most of the soldiers; but two soldiers were found guilty of manslaughter. These claimed benefit of clergy and were branded in the hand and released. Adams's upright and patriotic conduct in taking the unpopular side in this case met with its just reward in the following year, in the shape of his election to the Massachusetts House of Representatives by a vote of 418 to 118.

John Adams was a member of the Continental Congress from 1774 to 1778. In June 1775, with a view to promoting the union of the colonies, he seconded the nomination of Washington as commander-in-chief of the army. His influence in congress was great, and almost from the beginning he was impatient for a separation of the colonies from Great Britain. On June 7, 1776, he seconded the famous resolution introduced by Richard Henry Lee (q.v.) that "these colonies are, and of a right ought to be, free and independent states," and no man championed these resolutions (adopted on July 2) so eloquently and effectively before the congress. On June 8 he was appointed on a committee with Jefferson, Franklin, Livingston and Sherman to draft a Declaration of Independence; and although that document was by the request of the committee written by Thomas Jefferson, it was John Adams who occupied the foremost place in the debate on its adoption. Before this question had been disposed of, Adams was placed at the head of the board of war and ordinance, and he also served on many other important committees.

In 1778 John Adams sailed for France to supersede Silas Deane in the American commission there. But just as he embarked that commission concluded the desired treaty of alliance, and soon after his arrival he advised that the number of commissioners be reduced to one. His advice was followed and he returned home in time to be elected a member of the convention which framed the Massachusetts constitution of 1780, still the organic law of that commonwealth. With James Bowdoin and Samuel Adams, he formed a sub-committee which drew up the first draft of that instrument, and most of it probably came from John Adams's pen.

Before this work had been completed he was again sent to Europe, having been chosen, Sept. 27, 1779, as minister plenipotentiary for negotiating a treaty of peace and a treaty of commerce with Great Britain. Conditions were not then favourable for peace, however; the French Government, moreover, did not approve of the choice, inasmuch as Adams was not sufficiently pliant and tractable and was from the first suspicious of Vergennes; and subsequently Benjamin Franklin, Thomas Jefferson, John Jay and Henry Laurens were appointed to co-operate with Adams. Jefferson, however, did not cross the Atlantic, and Laurens took little part in the negotiations. This left the management of the business to the other three. Jay and Adams distrusted the good faith of the French Government. Outvoting Franklin, they decided to break their instructions, which required them to "make the most candid confidential communications on all subjects to the ministers of our generous ally, the king of France; to undertake nothing in the negotiations for peace or truce without their knowledge or concurrence; and ultimately to govern yourself by their advice and opinion"; and, instead, they dealt directly with the British commissioners, without consulting the French ministers. Throughout the negotiations Adams was especially determined that the right of the United States to the fisheries along the British-American coast should be recognized. Political conditions in Great Britain, at the moment made the conclusion of peace almost a necessity with the British ministry, and eventually the American negotiators were able to secure a peculiarly favourable treaty. This preliminary treaty was signed Nov. 30, 1782. Before these negotiations began, Adams had spent some time in the Netherlands. In July 1780 he had been authorized to execute the duties previously assigned to Henry Laurens, and at The Hague was eminently successful, securing there recognition of the United States as an independent government (April 19, 1782), and negotiating both a loan and, in Oct. 1782, a treaty of amity and commerce, the first of such

treaties between the United States and foreign powers after that of Feb. 1778 with France.

In 1785 John Adams was appointed the first of a long line of able and distinguished American ministers to the court of St. James's. When he was presented to his former sovereign, George III. intimated that he was aware of Adams's lack of confidence in the French Government. Replying, Adams admitted it, closing with the outspoken sentiment: "I must avow to your Majesty that I have no attachment but to my own country"—a phrase which must have jarred upon the monarch's sensibilities. While in London Adams published a work entitled *A Defence of the Constitution of Government of the United States* (1787). In this work he ably combated the views of Turgot and other European writers as to the viciousness of the framework of the state governments. Unfortunately, in so doing, he used phrases savouring of aristocracy which offended many of his countrymen—as in the sentence in which he suggested that "the rich, the well-born and the able" should be set apart from other men in a senate. Partly for this reason, while Washington had the vote of every elector in the first presidential election of 1789, Adams received only 34 out of 69. As this was the second largest number he was declared vice-president, but he began his eight years in that office (1789–97) with a sense of grievance and of suspicion of many of the leading men. Differences of opinion with regard to the policies to be pursued by the new government gradually led to the formation of two well-defined political groups—the Federalists and the Democratic-Republicans—and Adams became recognized as one of the leaders, second only to Alexander Hamilton, of the Federalists.

In 1796, on the refusal of Washington to accept another election, Adams was chosen president, defeating Thomas Jefferson; though Alexander Hamilton and other Federalists had asked that an equal vote should be cast for Adams and Thomas Pinckney, the other Federalist in the contest, partly in order that Jefferson, who was elected vice president, might be excluded altogether, and partly, it seems, in the hope that Pinckney should in fact receive more votes than Adams, and thus, in accordance with the system then obtaining, be elected president, though he was intended for the second place on the Federalist ticket. Adams's four years as chief magistrate (1797–1801) were marked by a succession of intrigues which embittered all his later life; they were marked, also, by events such as the passage of the Alien and Sedition acts, which brought discredit on the Federalist party. Moreover, factional strife broke out within the party itself; Adams and Hamilton became alienated, and members of Adams's own cabinet virtually looked to Hamilton rather than to the president as their political chief. The United States was, at this time, drawn into the vortex of European complications, and Adams, instead of taking advantage of the militant spirit which was aroused, patriotically devoted himself to securing peace with France, much against the wishes of Hamilton and of Hamilton's adherents in the cabinet. In 1800, Adams was again the Federalist candidate for the presidency, but the distrust of him in his own party, the popular disapproval of the Alien and Sedition acts and the popularity of his opponent, Thomas Jefferson, combined to cause his defeat. He then retired into private life. On July 4, 1826, on the 50th anniversary of the adoption of the Declaration of Independence, he died at Quincy. Jefferson died on the same day. In 1764 Adams had married Abigail Smith (1744–1818), the daughter of a Congregational minister at Weymouth (Mass.). She was a woman of much ability, and her letters, written in an excellent English style, are of great value to students of the period in which she lived. President John Quincy Adams was their eldest son.

ADAMS, JOHN COUCH (1819–1892), British astronomer, was born at Lidcot farmhouse, Lanest, Cornwall, on June 5,

1819. He was educated at St. John's College, Cambridge, and was senior wrangler and first Smith's prizeman of his year, 1843. While still an undergraduate he read of certain unexplained irregularities in the motion of the planet Uranus and determined to investigate them, with a view to ascertaining whether they might not be due to the action of a remote undiscovered planet. Elected fellow of his college in 1843, he at once attacked the problem. It was this: from the observed perturbations of a known planet to deduce by calculation, assuming only Newton's law of gravitation, the mass and orbit of an unknown disturbing body. By Sept. 1845 he obtained his first solution, and handed to Prof. Challis, the director of the Cambridge Observatory, a paper giving the elements of what he described as "the new planet."

It was not until July 1846 that the search for the new planet was begun at Cambridge. Meanwhile the French astronomer Leverrier had been working along similar lines with equally successful results, and a controversy arose as to whether the discovery of the new planet, Neptune, should be ascribed to the English or the French astronomer. As the facts became known the world recognized that the two astronomers had independently solved the problem of Uranus. The new planet, at first called *Leverrier* by F. Arago, received by general consent the neutral name of *Neptune*. Its mathematical prediction was an unsurpassed intellectual feat.

In 1851 Adams became president of the Royal Astronomical Society. His lay fellowship of St. John's College came to an end in 1852, but Pembroke College elected him in the following year to a lay fellowship which he held for the rest of his life. In 1858 he became professor of mathematics at St. Andrews, but lectured only for a session, when he vacated the chair for the Lowndean professorship of astronomy and geometry at Cambridge. Two years later he succeeded Challis as director of the Observatory, where he resided until his death.

Although Adams's researches on Neptune were those which attracted widest notice, his subsequent work on gravitational astronomy and terrestrial magnetism was not less remarkable. In 1852 he published new and accurate tables of the moon's parallax, which superseded J. K. Burckhardt's, and supplied corrections to the theories of M. C. T. Damoiseau, G. A. A. Plana and P. G. D. de Pontécoulant. In the following year his memoir on the secular acceleration of the moon's mean motion partially invalidated Laplace's famous explanation, which had held its place unchallenged for 60 years. For these researches the Royal Astronomical Society awarded him its gold medal in 1866. The great meteor shower of 1866 turned his attention to the Leonids, whose probable path and period had already been discussed by Prof. H. A. Newton. Adams ascertained that this cluster of meteors, which belongs to the solar system, traverses an elongated ellipse in 33 years and three months, and is subject to definite perturbations from the larger planets, Jupiter, Saturn and Uranus. These results were published in 1867. Ten years later, when G. W. Hill of Washington expounded a new method for dealing with the problem of the lunar motions, Adams briefly announced his own unpublished work in the same field, which, following a parallel course, had confirmed and supplemented Hill's.

The determination of the constants in Gauss's theory of terrestrial magnetism occupied him at intervals for more than 40 years. The calculations involved great labour, and were not published during his lifetime. They were edited by his brother, Prof. W. Grylls Adams, and appear in the second volume of the collected *Scientific Papers*. Numerical computations of this kind might almost be described as his pastime. The value of the constant known as Euler's, and the Bernoullian numbers up to the 62nd, he worked out to an incredible degree of accuracy. For Newton and his writings he had a boundless admiration; many of his papers, indeed, bear the cast of Newton's thought. He laboured for many years at the task of arranging and cataloguing the great collection of Newton's unpublished mathematical writings, presented in 1872 to the University by Lord Portsmouth, and wrote the account of them issued in a volume by the University Press in 1888.

The post of astronomer-royal was offered him in 1881, but he

preferred to pursue his peaceful course of teaching and research in Cambridge. After a long illness he died at the Cambridge Observatory on Jan. 21, 1892, and was buried in St. Giles's cemetery, near his home.

BIBLIOGRAPHY.—*The Scientific Papers of John Couch Adams*, 4to vol. i. (1896), and vol. ii. (1900), edited by William Grylls Adams and Ralph Allen Sampson, with a memoir by Dr. J. W. L. Glaisher, were published by the Cambridge University Press. The first volume contains his previously published writings; the second those left in manuscript, including the substance of his lectures on the Lunar Theory. A collection, virtually complete, of Adams's papers regarding the discovery of Neptune was presented by Mrs. Adams to the library of St. John's College. A description of them by Prof. Sampson was inserted in the *Memoirs* of the Royal Astronomical Society (vol. liv. p. 143).

ADAMS, JOHN QUINCY (1767–1848), eldest son of President John Adams, sixth president of the United States, was born on July 11, 1767, in that part of Braintree that is now Quincy (Mass.), and was named after John Quincy (1689–1767), his mother's grandfather, who was for many years a prominent member of the Massachusetts legislature. In 1778 and again in 1780, young Adams accompanied his father to Europe; studying in Paris in 1778–79 and at the University of Leyden in 1780. In 1780, also, he began to keep that diary which forms so conspicuous a record of the doings of himself and his contemporaries. In 1781, at the age of 14, he accompanied Francis Dana (1743–1811), American envoy to Russia, as his private secretary; but Dana was not received by the Russian Government, and in 1782 Adams joined his father at Paris, where he acted as "additional secretary" to the American commissioners in the negotiation of the treaty of peace which concluded the War of Independence. Instead of accompanying his father to London, he, of his own choice, returned to Massachusetts, graduated at Harvard college in 1787, three years later was admitted to practice at the bar and at once opened an office in Boston. A series of papers written by him in which he controverted some of Thomas Paine's doctrines in the *Rights of Man*, and later another series in which he ably supported the neutral policy of the Administration toward France and England, led to his appointment by Washington as minister to the Netherlands in May 1794. There was little for him to do at The Hague, but in the absence of a minister at London, he transacted certain public business with the English foreign secretary. In 1796 Washington appointed him minister to Portugal, but before his departure thither his father John Adams became president and changed his destination to Berlin (1797). While there, he negotiated (1799) a treaty of amity and commerce with Prussia. On Thomas Jefferson's election to the presidency in 1800, the elder Adams recalled his son, who returned home in 1801. The next year, he was elected to the Massachusetts senate, and in 1803 was sent to Washington as a member of the Senate of the United States.

Up to this time, John Quincy Adams was regarded as belonging to the Federalist Party, but he now found its general policy displeasing to him, was frowned upon, as the son of his father, by the followers of Alexander Hamilton, and found himself practically powerless as an unpopular member of an unpopular minority. He was not, and indeed never was, a strict party man. On the first important question that came before him in the Senate, the acquisition of Louisiana, he voted with the Republicans, regardless of the opposition of his own section. In Dec. 1807 he warmly seconded Jefferson's suggestion of an embargo and vigorously urged instant action, saying: "The president has recommended the measure on his high responsibility. I would not consider, I would not deliberate; I would act!" Within five hours the Senate had passed the Embargo bill and sent it to the House. The support of a measure so unpopular in New England caused him to be hated by the Federalists there, and cost him his seat in the Senate; his successor was chosen on June 3, 1808, several months before the usual time of filling the vacancy, and five days later Adams resigned. In the same year he attended the Republican congressional caucus which nominated Madison for the presidency, and thus definitely joined the Republicans. From 1806 to 1809 Adams was professor of rhetoric and oratory at Harvard.

In 1809 President Madison sent Adams to Russia to represent

the United States. He arrived at St. Petersburg (Leningrad) at the psychological moment when the tsar had made up his mind to break with Napoleon. Adams therefore met with a favourable reception and a disposition to further the interests of American commerce in every possible way. On the outbreak of the war between the United States and England in 1812, he was still at St. Petersburg. In September of that year, the Russian Government suggested that the tsar was willing to act as mediator between the two belligerents. Madison precipitately accepted this proposition and sent Albert Gallatin and James Bayard to act as commissioners with Adams; but England would have nothing to do with it. In Aug. 1814, however, these gentlemen, with Henry Clay and Jonathan Russell, began negotiations with English commissioners which resulted in the signature of the Treaty of Ghent on Dec. 24 of that year. After this Adams visited Paris, where he witnessed the return of Napoleon from Elba, and then went to London, where, with Henry Clay and Albert Gallatin, he negotiated (1815) a "Convention to Regulate Commerce and Navigation." Soon afterwards he became U.S. minister to Great Britain, as his father had been before him, and as his son, Charles Francis Adams, was after him. After accomplishing little in London, he returned to the United States in the summer of 1817 to become secretary of State in the cabinet of President Monroe.

Later Career.—As secretary of State, Adams played the leading part in the acquisition of Florida and the promulgation of the Monroe Doctrine. Ever since the acquisition of Louisiana successive administrations had sought to include a part at least of Florida in that purchase. In 1819, after long negotiations, Adams succeeded in bringing the Spanish minister to the point of signing a treaty in which the Spaniards abandoned all claims to territory east of the Mississippi, and the United States relinquished all claim to what is now known as Texas. Before the Spanish Government ratified the treaty in 1820, Mexico, including Texas, had thrown off allegiance to the mother country, and the United States had occupied Florida by force of arms. The Monroe Doctrine (*q.v.*) rightly bears the name of the president who in 1823 assumed the responsibility for its promulgation; but it was primarily the work of John Quincy Adams. The eight years of Monroe's presidency (1817–25) are known as the "Era of Good Feeling." As his second term drew to a close, there was a great lack of good feeling among his official advisers, three of whom—Adams, secretary of State, Calhoun, secretary of War, and Crawford, secretary of the Treasury—aspired to succeed him in his high office. In addition Henry Clay and Andrew Jackson were also candidates. Calhoun was nominated for the vice-presidency. Of the other four, Jackson received 99 electoral votes, Adams 84, Crawford 41, and Clay 37; as no one had a majority, the decision was made by the House of Representatives, which was confined in its choice to the three candidates who had received the largest number of votes. Clay, who was speaker of the House of Representatives, and had for years assumed a censorious attitude toward Jackson, cast his influence for Adams and thereby secured his election on the first ballot. A few days later Adams offered Clay the secretaryship of State, which was accepted. The wholly unjust and baseless charge of "bargain and corruption" followed, and the feud thus created between Adams and Jackson greatly influenced the history of the United States.

Up to this point Adams's career had been almost uniformly successful, but his presidency (1825–29) was in most respects a failure, owing to the virulent opposition of the Jacksonians; in 1828 Jackson was elected president over Adams. It was during his administration that irreconcilable differences developed between the followers of Adams and the followers of Jackson, the former becoming known as the National Republicans, who with the Anti-Masons were the precursors of the Whigs. In 1829 Adams retired to private life in the town of Quincy; but only for a brief period, for in 1830, largely by Anti-Masonic votes, he was elected a member of the national House of Representatives. On its being suggested to him that his acceptance of this position would degrade an ex-president, Adams replied that no person could be degraded by serving the people as a representative in Congress or, he added, as a selectman of his town. His service in Congress from 1831

until his death is, in some respects, the most noteworthy part of his career.

Throughout he was conspicuous as an opponent of the extension of slavery, though he was never technically an abolitionist, and in particular he was the champion in the House of Representatives of the right of petition at a time when, through the influence of the Southern members, this right was, in practice, denied by that body. His prolonged fight for the repeal of the so-called "gag laws" is one of the most dramatic contests in the history of Congress. The agitation for the abolition of slavery, which really began in earnest with the establishment of the *Liberator* by William Lloyd Garrison in 1831, soon led to the sending of innumerable petitions to Congress for the abolition of slavery in the District of Columbia, over which the Federal Government had jurisdiction, and for other action by Congress with respect to that institution. These petitions were generally sent to Adams for presentation. They aroused the anger of the pro-slavery members of Congress, who, in 1836, brought about the passage of the first "gag rule," the Pinckney resolution, presented by Henry L. Pinckney, of South Carolina. It provided that all petitions relating to slavery should be laid on the table without being referred to committee or printed; and, in substance, this resolution was readopted at the beginning of each of the immediately succeeding sessions of Congress, the Patton resolution being adopted in 1837, the Atherton resolution, or "Atherton gag," in 1838, and the Twenty-first rule in 1840 and subsequently until repealed. Adams contended that these "gag rules" were a direct violation of the First amendment to the Federal Constitution, and refused to be silenced on the question, fighting for repeal with indomitable courage, in spite of the bitter denunciation of his opponents. Each year the number of anti-slavery petitions received and presented by him increased; perhaps the climax was in 1837, when Adams presented a petition from 22 slaves, and, when threatened by his opponents with censure, defended himself with remarkable keenness and ability. At each session, also, the majority against him decreased until in 1844 his motion to repeal the Twenty-first rule was carried by a vote of 108 to 80 and his battle was won. On Feb. 21, 1848, after having suffered a previous stroke of apoplexy, he fell insensible on the floor of the Representatives' chamber, and two days later died. Few men in American public life have possessed more intrinsic worth, more independence, more public spirit and more ability than Adams; but throughout his political career he was handicapped by a certain reserve, a certain austerity and coolness of manner, and by his consequent inability to appeal to the imaginations and affections of the people as a whole. He had, indeed, few intimate political or personal friends, and few men in American history have, during their lifetime, been regarded with so much hostility and attacked with so much rancour by their political opponents.

ADAMS, MAUDE (1872-), American actress, was born in Salt Lake City, Utah, on Nov. 11, 1872. The family name was Kiskadden, but she adopted the maiden name, Adams, of her mother, an actress. From an early age she played juvenile parts, and at the age of 16 went to New York. From her appearance in Hoyt's *A Midnight Bell*, in 1889, her popularity grew steadily. In 1897 Charles Frohman gave her her first leading part as Lady Babbie in *The Little Minister*; and in *Peter Pan* she achieved a great success. She introduced Rostand to the American stage, taking the title-rôle in *L'Aiglon* in 1901, and in *Chantecler* in 1911. Other plays in her repertory were *Romeo and Juliet*, *The Pretty Sister of José*, *The Jester* and *As You Like It*.

ADAMS, OSCAR FAY (1855-1919), American author and editor, was born in Worcester, Mass., in 1855. He was educated in the New Jersey State Normal school. He became a teacher of English literature and a frequent contributor to periodicals. In 1886 he edited *Through the Year with the Poets*, in 12 volumes.

His published writings include *The Story of Jane Austen's Life* (1891, 2nd ed. 1897); *The Archbishop's Unguarded Moment and Other Stories* (1899); *A Brief Handbook of English Authors* (1884, 7th ed. 1893); *Dear Old Story Tellers* (1889, new ed. 1911); *A Dictionary of American Authors* (1897, 5th ed. 1905); and *A Motley Jest—Shakespearean Diversions* (1909). He was also American editor for *The Henry Irving Shakespeare*. He died in North Truro, Mass., April 30, 1919.

ADAMS, ROGER (1889-), American chemist, was born in Boston, Mass., on Jan. 2, 1889. He was educated at Harvard university from which he graduated in 1909 and received the degree of Ph.D. in 1912. Following two years' study in the University of Berlin and the Kaiser Wilhelm institute, 1912-13, he returned to Harvard where he was instructor in organic chemistry for three years. In 1916 he was made assistant professor, in 1919 professor, and in 1926 head of the department of organic chemistry, in the University of Illinois. He has made important researches on catalysts, local anaesthetics, platinum oxide, alkali-insoluble phenols, chaulmoogric acid derivatives and other organic compounds, in recognition of which he was awarded the Nichols medal (1927). His writings include *Organic Syntheses* (1921) and many articles on chemical subjects.

ADAMS, SAMUEL (1722-1803), American statesman, born in Boston (Mass.), on Sept. 27, 1722, a second cousin to the elder John Adams. He graduated at Harvard college in 1740 and began the study of law. Though he repeatedly failed in business and was sued because of his easy methods as tax-collector, he became so influential in local politics as to be called the "Man of the Town Meeting."

He first came into wider prominence at the beginning of the Stamp Act episode, when as author of Boston's instructions to its representatives in the general court of Massachusetts he urged strenuous opposition to taxation by act of parliament. At about the same time he was elected to the lower house of the general court, in which he served until 1774, after 1766 as clerk. As

HOUSE AT LEXINGTON, MASS., FROM WHICH ADAMS AND HANCOCK ESCAPED WHEN AROUSED BY PAUL REVERE

James Otis's vigour and influence declined, Adams took a more prominent position in the revolutionary councils, in which he advised against any form of compromise. Many of the Massachusetts revolutionary documents, including the famous "Massachusetts Resolves" and the circular letter to the legislatures of the other colonies, are from his pen. Indeed, there can

be no question that he was one of the first American political leaders to deny the legislative power of parliament and to desire and advocate separation from the mother country.

To promote the ends he had in view Adams suggested non-importation, instituted the Boston committees of correspondence, urged that a Continental Congress be called, and wrote a vast number of articles for the newspapers, especially the *Boston Gazette*, over a multitude of signatures. He was, in fact, one of the most voluminous and influential political writers of his time. His style is clear, vigorous and epigrammatic; his arguments are characterized by strength of logic and appeals to passion, and are based not so much on precedent and documentary authority as on "natural right." Although he lacked oratorical fluency, his short speeches, like his writings, were forceful; and he was an eminently successful manager of men, shrewd, wily, adroit, an adept in all the arts of the politician. He is considered to have done more than any other one man, in the years immediately preceding the War of Independence, to mould and direct public opinion in his community; and by his contemporaries he was credited with equally successful management of the delegates to the first Continental Congress.

During the intense excitement which followed the "Boston Massacre," Adams skilfully secured the removal of the soldiers from the town to a fort in the harbour. He also managed the

proceedings of the "Boston Tea Party," and later he was leader in the opposition to the Boston Port bill. One of the objects of the expedition sent by the governor, Gen. Thomas Gage, to Lexington (*q.v.*) and Concord on April 18-19, 1775, was the capture of Adams and John Hancock, temporarily staying in Lexington, and when Gage issued his proclamation of pardon on June 12 he excepted these two, whose offences, he said, were "of too flagitious a nature to admit of any other consideration than that of condign punishment."

As a delegate to the Continental Congress, from 1774 to 1781, Adams vigorously opposed any concession to the British Government; strove for harmony among the several Colonies in the common cause; served on the committee to prepare a plan of confederation and signed the Declaration of Independence. His most important service was in organizing the forces of revolution before 1775. In 1779 he was a member of the convention which framed the constitution of Massachusetts adopted in 1780, and in 1788 a member of the Massachusetts convention to ratify the Constitution of the United States. From 1789 to 1794 Adams was lieutenant-governor of his State, and from 1794 to 1797 governor. After the formation of parties he became allied with the Democratic-Republicans rather than with the Federalists. He died in Boston on Oct. 2, 1803.

Cushing (ed.), *The Writings of Samuel Adams* (4 vol., New York, 1904-08); and "Warren-Adams Letters" (2 vol., Mass. Hist. Soc., Collections, 1917-25). (E. C.)

ADAMS, SAMUEL HOPKINS (1871-), American author, was born in Dunkirk, N.Y., on Jan. 26, 1871. He graduated at Hamilton college in 1891 and entered journalism. From 1891 to 1900 he was engaged as a reporter and special writer for the *New York Sun*. He was managing editor of McClure's syndicate in 1900-01, advertising manager of McClure, Phillips and Company in 1901-02, and from 1903 to 1905 member of the editorial staff of *McClure's Magazine*. In 1905 he contributed to *Collier's Weekly* a noteworthy series of articles exposing fraudulent quack medicines, and in 1915-16, in the *New York Tribune*, he similarly exposed dishonourable practices in advertising.

Among his published writings are: *The Mystery*, with Stewart Edward White (1905); *The Great American Fraud* (1905); *The Flying Death* (1906); *Average Jones* (1911); *The Secret of Lonesome Cove* (1913); *The Health Master* (1913); *The Clarion* (1914); *Little Miss Grouch* (1915); *The Unspeakable Perk* (1916); *Our Square and the People in It* (1917); *Common Cause* (1918); *Wanted, a Husband* (1919); *Success* (1921); *From a Bench in Our Square* (1922); *Siege* (1924); and *Revelry* (1926).

ADAMS, SARAH FLOWER (1805-1848), English poet, was born at Great Harlow, Essex, Feb. 22, 1805. She was the daughter of Benjamin Flower and in 1834 married William Bridges Adams, inventor and pamphleteer. She was a Unitarian and her writings are chiefly religious. Her longest work, *Vivia Perpetua* (1841), a dramatic poem having for its subject the life of the early Christians, contains impressive passages. Besides various other poems, she wrote several beautiful hymns, the best known of which is "Nearer, My God, to Thee" (1840). She died in Aug. 1848.

ADAMS, THOMAS (d. c. 1655), English Puritan divine, held churches at Willington in Bedfordshire, Wingrave in Bucks, and then in London. His "occasionally" printed sermons, collected in 1629, show him to have been a brilliant and witty preacher. Southey, indeed, calls him "the prose Shakespeare of Puritan theologians." His numerous works show great learning in the classics and the fathers of the church, and abound in all kinds of stories and aphorisms.

See the edition of his works in J. P. Nichol's *Puritan Divines*, by J. Angus and T. Smith (1862).

ADAMS, WALTER SYDNEY (1876-), American astronomer, was born in Antioch, Northern Syria, on Dec. 20,

1876. He graduated from Dartmouth college, Hanover, N.H., in 1898, studied at the University of Chicago in 1899-1900 and at the University of Munich in 1901. For the ensuing three years he was an assistant and instructor in the Yerkes observatory at Lake Geneva, Wis. He was assistant astronomer at the Mt. Wilson observatory of the Carnegie Institution, Pasadena, Calif., from 1904 to 1909, when he was made astronomer. He served also as acting or assistant director from 1910 until 1923, at which time he was appointed director of the observatory. His writings include a memoir on the rotation of the sun and numerous papers on stellar motions, solar and stellar spectroscopy, and other astronomical subjects.

ADAMS, WILLIAM (d. 1620), English navigator, the first Englishman in Japan, was born at Gillingham, near Chatham, England. When 12 years old he was apprenticed in the mercantile marine, afterwards entering the British navy, and later serving the company of Barbary merchants as master and pilot. Attracted by the Dutch trade with India, he shipped as pilot major with a little fleet of five ships despatched from the Texel in 1598 by a company of Rotterdam merchants. The vessels, boats ranging from 75 to 250 tons and crowded with men, were driven to the coast of Guinea, where the adventurers attacked the island of Annabon for supplies, and finally reached the straits of Magellan. Scattered by stress of weather the following spring the "Charity," with Adams on board, and the "Hope," met at length off the coast of Chile, where the captains of both vessels lost their lives in an encounter with the Indians. In fear of the Spaniards, the remaining crews determined to sail across the Pacific. On this voyage the "Hope" was lost, but in April 1600 the "Charity," with a crew of sick and dying men, was brought to anchor off the island of Kiushiu, Japan.

Adams was summoned to Osaka and there examined by Iye-yasu, the guardian of the young son of Taiko Sama, the ruler, who had just died. His knowledge of ships and shipbuilding, and his nautical smattering of mathematics, raised him in the estimation of the shogun, and he was presented with an estate at Hemi near Yokosuka; but was refused permission to return to England. In 1611 news came to him of an English settlement in Bantam, and he wrote asking for help. In 1613 Captain John Saris arrived at Hirado in the ship "Clove" with the object of establishing a trading factory for the East India Company, and after obtaining the necessary concessions from the shogun, Adams postponed his voyage home (permission for which had now been given him) in order to take a leading part, under Richard Cocks, in the organization of this new English settlement.

He had already married a Japanese woman, by whom he had a family, and the latter part of his life was spent in the service of the English trading company, for whom he undertook a number of voyages to Siam in 1616, and Cochinchina in 1617 and 1618. He died May 16, 1620, some three years before the dissolution of the English factory. His Japanese title was Anjin Sama, and his memory was preserved in the naming of a street in Yedo, Anjin Cho (Pilot Street), and by an annual celebration on June 15 in his honour.

See *England's Earliest Intercourse with Japan*, by C. W. Hillary (1905); *Letters written by the English Residents in Japan*, ed. by N. Murakami (1900, containing Adams's Letters reprinted from *Memoirs of the Empire of Japan*, ed. by T. Rundall, Hakluyt Society, 1850); *Diary of Richard Cocks*, with preface by N. Murakami (1899, reprinted from the Hakluyt Society ed. 1883); R. Hildreth's *Japan* (1855); J. Harris's *Navigantium atque Itinerantium Bibliotheca* (1764), i. 856; *Voyage of John Saris*, ed. by Sir E. M. Satow (Hakluyt Society, 1900); *Asiatic Society of Japan Transactions*, xxvi. (sec. 1898) pp. 1 and 194, where four more hitherto unpublished letters of Adams are given; *Collection of State Papers; East Indies, China and Japan*. The ms. of his logs written during his voyages to Siam and China is in the Bodleian Library at Oxford.

ADAMS, WILLIAM TAYLOR (1822-1897), American juvenile writer, popularly known under the pseudonym of "Oliver Optic," was born in Medway, Mass., on July 30, 1822. For 20 years he was a teacher in the public schools of Boston, and he served for a term in the State legislature. He wrote more than 100 books, chiefly juvenile fiction, which appeared in several series. In large part these were contributed to *Oliver Optic's*

Magazine, of which he was founder and editor. Among the best known are "Boat Club" series (1854), "Riverdale Story Books" (1858), "Woodville Stories" (1863-67), "Army and Navy" series (1865-1894), "Starry Flag" series (1867-69), "Young America Abroad" series (1867-69), "Great Western" series (1875-82), "Yacht Club" series (1900-03). He wrote also two novels, *The Way of the World* (1867) and *Living Too Fast* (1876). He died in Boston on March 27, 1897.

ADAMS, a town of Berkshire county, Mass., U.S.A., near the north-western corner of the State; including part of the valley of the Hoosac river, and extending from the Hoosac mountains on the east to Mt. Williams (3,040ft.) and Mt. Greylock (3,505ft.) on the west. It has an area of 23sq.m., and a population of 12,967 in 1920, of whom 3,949 were foreign-born whites; and 12,697 in 1930, Federal census. The principal village, Adams, is on a branch of the Boston and Albany railroad, and is the nearest railway station for an ascent of Mt. Greylock. It is a busy industrial centre, with cotton, woollen, silk and paper mills. The town (originally East Hoosuck) was surveyed in 1749 and incorporated in 1778. It was named after Samuel Adams, the revolutionary leader. North Adams was made a separate township in 1878.

ADAM'S APPLE, the movable projection (more prominent in males) in the front of the throat formed by the thyroid cartilage of the larynx. The "Adam's apple" is one of the particular points of attack in the Japanese system of self-defence known as ju-jutsu (*q.v.*).

ADAM'S BRIDGE or **RAMA'S BRIDGE**, a chain of sandbanks between the Island of Manaar, near the north-west coast of Ceylon and the Island of Rameswaram, off the Indian coast, and lying between the Gulf of Manaar on the south-west and Palk Strait on the north-east. More than 30m. long, it seriously hinders navigation. Some of the sandbanks are dry, and no part of the shoal has a greater depth than 3ft. or 4ft. at high water. Though dredging operations were begun as early as 1838 they never succeeded in maintaining a channel for any save vessels of light draught and have now been abandoned. Geological evidence shows that this gap was once bridged by a continuous isthmus, which, according to temple records, was breached by storm in 1480. These banks and shoals are traditionally supposed to be the remains of a huge causeway constructed by Rama, the hero of the *Ramayana*, to facilitate passage of his army from India to Ceylon for the rescue of his abducted wife Sita.

ADAM SCOTUS (c. 1180), theological writer, sometimes called Adam Anglicus or Anglo-Scotus, was born in the south of Scotland in the first half of the 12th century. About 1150 he was a Premonstratensian canon at St. Andrews, and about 20 years later was perhaps abbot and bishop of Candida Casa (Whithorn) in Galloway. He gained a European reputation for his writings, which are of mystico-ascetic type, and include an account of the Premonstratensian order, a collection of festival sermons, and a *Soliloquia de instructione discipuli*, formerly attributed to his contemporary, Adam of St. Victor.

ADAMSEN, AMANDUS HEINRICH (1855-), Estonian sculptor, studied in St. Petersburg (Leningrad). In 1887 he produced a portrait in relief of Tsar Alexander III.; he then went to Paris, where he lived for several years. In 1891 he returned to his native land and lived alternately in Port Baltic and St. Petersburg.

Adamsen's technique in marble and wood has been moulded on classical lines. His small wood carvings are incomparable. His most important works are an allegory, shown at the Paris Exhibition in 1889, entitled "Liebe, Tod und Wissenschaft"; "Die Welle," and "Hunger"; also "Befreiter Genius" and "Sieg der Arbeit," which were executed for the Nijni-Novgorod Exhibition.

ADAMSON, PATRICK (1537-92), Scottish divine, Archbishop of St. Andrews, was born at Perth and educated at St. Andrews. He then spent some years in Paris, and was in hiding for seven months after the massacre of St. Bartholomew. He returned to Scotland in 1572, and in 1576 was appointed Archbishop of St. Andrews. He came into acute conflict with the General Assembly, and was twice excommunicated, though in each case

the sentence was remitted. The last years of his life were spent in poverty. His collected works, which include Latin verse translations of the books of Job and Revelation, were printed in 1614.

ADAMSON, ROBERT (1852-1902), Scottish philosopher, was born in Edinburgh on Jan. 19, 1852. After a distinguished career at Edinburgh university he spent some time at Heidelberg (1871), where he began his study of German philosophy. He then returned to Edinburgh as assistant, first to Henry Calderwood and later to A. Campbell Fraser; he joined the staff of the *Encyclopaedia Britannica* (9th ed.) (1874). In 1876 he succeeded W. S. Jevons in the chair of logic and philosophy at Owens college, Manchester. In 1893 he went to Aberdeen, and finally, in 1895, to the chair of logic at Glasgow, which he held till his death on Feb. 5, 1902. At Glasgow university he accomplished a great deal of useful administrative work and left a substantial impress on its constitution.

In 1903, under the title *The Development of Modern Philosophy and Other Essays*, his more important lectures were published with a short biographical introduction by Prof. W. R. Sorley of Cambridge university (see *Mind*, xiii. p. 73 seq.) (1904). Most of the matter is taken verbatim from the notebook of one of his students. Under the same editorship there appeared, three years later, his *Development of Greek Philosophy*.

Throughout his lectures Adamson pursued the critical and historical method without formulating a constructive theory of his own. He felt that any philosophical advance must be based on the Kantian methods. As he grew older his metaphysical optimism waned. He felt that the increase of knowledge must come in the domains of physical science. Adamson represented an empiricism which, so far from refuting, was actually based on, idealism, and yet was alert to expose the fallacies of a particular idealist construction (see his essay in *Ethical Democracy*, edited by Dr. Stanton Coit).

ADAM'S PEAK, a mountain in Ceylon, about 45m. E. of Colombo, in 6° 55' N., 80° 30' E. It rises steeply to a height of 7,352ft. and commands a magnificent prospect. Its conical summit terminates in an oblong platform, 74ft. by 24, on which there is a hollow, resembling the form of a human foot, 5ft. 4in. by 2ft. 6in. It is held in high veneration by Buddhists, Mohammedans and Hindus alike, and by them is respectively ascribed to Gau-

ADAM'S PEAK, CEYLON. AS SEEN FROM GALLE FACE, COLOMBO. VENERATED BY THE SINHALESE. PILGRIMS ASCEND TO THE SACRED SPOT

tama, to Adam and to Siva. It is in charge of Buddhist monks, and is the resort of large numbers of pilgrims. At dawn the peak frequently casts a very well-defined shadow upon the clouds. It can be reached from Hatton on the railway or from Ratnapura.

ADANA. (1) A vilayet in south-east Asia Minor, including the ancient Cilicia. Pop. (1927) 227,652. The mountain districts are rich in unexploited mineral wealth, and the fertile coast-plain, watered by streams from the Taurus, produces cotton, rice, cereals, sugar and much fruit, and affords abundant pasturage. Imports and exports pass through Mersina (*q.v.*). (2) The chief town of the vilayet, in the alluvial plain about 30m. from the sea in 37° 1' N., 35° 18' E., on the right bank of the Seihan (Sihun, anc. Sarus), navigable by small craft as far as the town. Adana is connected with Tarsus and Mersina by a railway

built in 1887, and has a magnificent stone bridge, carrying the road to Missis and the East, and dating in parts from the time of Justinian, but restored first in A.D. 743 and called Jisr al-Walid after the Omayyad caliph of that name, and again in 840 by Caliph Mutasim. There are, also, a ruined castle founded by Harun al-Rashid in 782, fine fountains, good buildings, river-side quays and cotton mills. Adana, which retains its ancient name, was a station on the Roman military road to the East, and at one time a rival of Tarsus. It was largely rebuilt by Mansur in 758. Its position, commanding the passage of the mountains to the north of Syria, led to many vicissitudes. In the contest between Egyptians and Turks in 1832, after the defeat of the Turkish army at Konia, it was granted to Ibrahim Pasha, and though the firman named him only *muhassil*, or collector of the Crown revenue, it continued to be held by the Egyptians till the treaty of July 1840 restored it to the Porte. The chief productions of the province are cotton, corn, sesame and wool, which are largely exported. In 1927 the population was given as 108,957.

ADANSON, MICHEL (1727–1806), French naturalist of Scottish descent, was born at Aix-en-Provence. He travelled in Senegal and published an *Histoire naturelle du Sénégal* (Paris, 1757). Adanson's chief work was done as a botanist. In his *Familles naturelles des plantes* (1763) he opened the way for the natural classification of plants developed later by A. L. de Jussieu in his *Genera Plantarum* (1780). He also left a vast unfinished encyclopaedia on all known beings and substances, which has never been published.

ADAPA, MYTH OF. Adapa was a legendary sage, a citizen of Eridu, a city of Babylonia. Endowed with vast intelligence by the God Ea, he became the hero of the Eridu myth of the Fall of Man. Adapa, in spite of his possession of all wisdom was denied immortality, and one day, while fishing, the south wind blew so violently that he was thrown into the sea. In his rage he broke the wings of the south wind which then ceased to blow. Anu, the god of heaven, summoned him before his gates to receive punishment, but jealous Ea (god of wisdom) cautioned him not to touch the bread and water which would be offered him. When Adapa came before Anu, Tammuz and Gishzida interceded for him and explained to the god of heaven that as Adapa had been endowed with omniscience he needed only immortality to become a god; Anu then offered Adapa the bread and water of eternal life, which he refused to take. Thus mankind became mortal. (See *The Cambridge Ancient History*, vol. i. [1924].)

ADAPTATION, a process of fitting, or modifying, a thing to other uses, and so altering its form or original purpose. In literature there may be, e.g., an adaptation of a novel for a drama, or in music an arrangement of a piece for two hands into one for four, etc. In biology, adaptation plays a prominent part as the process by which an organism or species becomes modified to suit the conditions of its life. Every change in a living organism involves adaptation; for in all cases life consists in a continuous adjustment of internal to external relations. Some adaptations are produced afresh in each generation, others are transmitted by heredity, having been probably fixed by natural selection. (See EVOLUTION, VARIATION AND SELECTION.)

ADDA (anc. *Addua*), a river of North Italy. It rises in small lakes of the Fraele glen, and unites with several smaller streams near Bormio, in the Rhaetian Alps. Thence it flows south-west and west through the fertile Valtellina (*q.v.*) passing Tirano; the Poschiavino joins it at Tirano and the Malero at Sondrio. It falls into the northern end of the Lake of Como. On issuing from the south-east or Lecco arm, it crosses the plain of Lombardy, and, after a course of about 150m., joins the Po 8m. above Cremona. The lower Adda once bounded the territories of Venice and of Milan. At Trezzo, 20m. N.E. of Milan, there is an important hydro-electric power plant.

ADDAMS, JANE (1860–), American sociologist, was born at Cedarville (Ill.), on Sept. 6, 1860. After graduating at Rockford (Ill.) female seminary (now Rockford college) in 1881, she spent several years in the study of economic and sociological questions in both Europe and America, and in 1889, with Miss Ellen Gates Starr, established in Chicago (Ill.) the social settle-

ment known as Hull House, of which she became the head worker. The success of this settlement, which became a great factor for good in the city, was principally due to Miss Addams's rare executive skill. Her personal participation in the life of the community is exemplified in her acceptance of the office of inspector of streets and alleys under the municipal government. She became widely known as a lecturer and writer on social problems and published *Democracy and Social Ethics* (1902); *Newer Ideals of Peace* (1907), and *The Spirit of Youth and the City Streets* (1909). She was chairman of the International Congress of Women held at The Hague in 1915. A permanent organization was then established, the Women's International League for Peace and Freedom, of which she became president. Her books include *Twenty Years at Hull House* (1910); *A New Conscience and an Ancient Evil* (1912); *The Long Road of Woman's Memory* (1916); *Second Twenty Years at Hull House* (1930).

ADDAX, a genus of antelopes, with one species (*A. nasomaculatus*) from North Africa and Arabia. It is 3 ft. high, yellowish white in colour, with a brown mane and fringe on the throat. Both sexes carry horns, which are ringed and form an open spiral. The addax is a desert antelope. It is hunted by the Arabs for its flesh and to test the speed of their horses and greyhounds.

ADDER, a name for the common viper (*Vipera berus*) of Europe and Asia. The puff-adder (*Bitis arietans*), widespread in Africa, and the death-adder (*Acanthophis antarcticus*), of Australia, are both very poisonous. In North America the harmless hognose snake (*Heterodon contortrix*), which hisses loudly, is called puffing adder or spreading adder. See HOGNOSE; VIPERS.

ADDICT, DRUG: see DRUG ADDICTION.

ADDING MACHINE: see OFFICE APPLIANCES.

ADDIS ABABA (the new flower), capital of Abyssinia since 1896, about 8,000ft. above sea level on the southern slopes of the Entoto Mts. in 9° 1' N., 38° 56' E. It is linked by a single railway line (784km.) with Jibuti, the principal town of French Somaliland on the Gulf of Aden, and since the completion of the line in 1918 Addis Ababa has undergone much change. It is embowered in woods of eucalyptus planted by Emperor Menelik to repair the ravages caused in neighbouring forests by his army and followers; and is watered by small tributaries of the Hawash river, notably the Akaki and the Kabana. The population in normal times consists of some 70,000 people, but at least times many thousands of the followers of the chiefs and provincial governors attend the court. The increasing number of foreign legations are quartered in well-built houses in large grounds some 4m. out of the town. Since the visit of the regent and some of the chiefs to Europe in 1924 many motor cars have been imported into the town and roads made. Shops, stores and offices have been built around the vast central market place, until recently a bare space dotted with piles of stones used as booths, the daily rendezvous of immense numbers of peasants and traders dealing in local and imported cotton and other goods. The Gebbi or imperial palace is a rambling collection of buildings of every kind enclosed by high stone walls, but the King's dwelling is a modern and well equipped house, and quite recently large stone buildings have been erected for government use.

No sanitary, water, or lighting arrangements exist, but there is a telephone service and a bi-weekly postal service to and from the coast. Addis Ababa is the seat of government and the centre of trade, and £1,750,000 worth of goods were transported in and out of the town by rail in 1926.

ADDISON, JOSEPH (1672–1719), English essayist, poet and man of letters, eldest son of Lancelot Addison, later Dean of Lichfield, was born at his father's rectory of Milston in Wiltshire, on May 1, 1672. After having attended several schools, the last Charterhouse, he was entered a commoner of Queen's College, Oxford, at the age of 15; but after two years was elected to a demyship of Magdalen College for his skill in Latin versification. He took his master's degree in 1693, and subsequently obtained a fellowship which he held until 1711. Much of his early Latin verse is preserved in the *Musae Anglicanae* (1691–99). A

poem in the third volume of Dryden's *Miscellanies* followed in the next series by a translation of the fourth *Georgic*, brought about his introduction to Tonson the bookseller, and (probably through Tonson) to Lord Somers and Charles Montagu. To both of these persons he commended himself by *An Account of the Greatest English Poets* (1694), *An Address to King William* (1695), after Namur, and a Latin poem entitled *Pax Gulielmi* (1697), on the Peace of Ryswick, with the result that in 1699 he obtained a pension of £300 a year to enable him (as he afterwards said in a memorial addressed to the Crown) "to travel and qualify himself to serve his Majesty." In the summer of 1699 he crossed into France, where chiefly for the purpose of learning the language, he remained till the end of 1700; and after that he spent a year in Italy. In Switzerland, on his way home, he was stopped by receiving notice that he was to attend the army under Prince Eugene, then engaged in the war in Italy, as secretary from the King. But in March 1702 the death of King William at once drove his Whig friends from power and Addison's pension ceased. He was able, however, to visit a great part of Germany, and did not reach Holland till the spring of 1703. In the autumn of the same year Addison returned to England.

AFTER THE STATUE IN WESTMINSTER ABBEY
ADDISON WHO, WITH STEELE, DELIGHTED THE TOWN WITH THE "SPECTATOR"

During his residence abroad he wrote the rhymed *Letter from Italy* to Charles Montagu, the *Dialogues on the Usefulness of Medals*, not published until after his death, and the *Remarks on several parts of Italy*, printed in 1705. After his return to England he was asked by Lord Halifax to write a poem celebrating Marlborough's victory at Blenheim. This, *The Campaign* (1704), won for its author a post in the excise, which was practically a sinecure. The next ten years of his life were spent in government service as an under-secretary of State, secretary to Lord Halifax on a mission to the Elector of Hanover (1708), and secretary to Lord Wharton, the lord lieutenant of Ireland (1708-10). His commissionership in the excise he retained all his life, and he sat in Parliament, a silent member, from 1708 onwards, first for Lostwithiel and then for Malmesbury. During this period he wrote an anonymous pamphlet in defence of the Government entitled *The Present State of the War* (1707), and an opera libretto, *Rosamond*, complimenting the Duke of Marlborough, which was a failure at the time, but was afterwards set to music by Dr. Arne with great success. In 1711 he purchased for £10,000 the estate of Bilton near Rugby.

Soon after the fall of the ministry, he started the *Whig Examiner* in opposition to the Tory *Examiner*, then conducted by Prior, and afterwards the vehicle of Swift's most vehement invectives against the party to which he had once belonged. These are certainly the most ill-natured of Addison's writings; but they are neither lively nor vigorous, and the paper died after five numbers (Sept. 14 to Oct. 12 1710). There is more spirit in his allegorical pamphlet, *The Trial and Conviction of Count Tariff*. But meanwhile Addison found his real vocation as one of the greatest of English essayists. Richard Steele, who had been Addison's schoolfellow at the Charterhouse, remained on intimate terms with him and belonged to the same political party. Addison was in Dublin when, in April 1709, Steele published the first number of the "Tatler." He is said to have detected his friend's authorship only by recognizing in the sixth number a critical remark on Virgil, which he remembered having himself communicated to Steele. He began to furnish hints and suggestions, assisted occasionally and finally wrote regularly. According to Aitken (*Life of Steele*, i. 248), he contributed 42 out of the total of 271 numbers, and was part-author of 36 more. With the advent of Addison as a contributor the character of the "Tatler" changed. The essay began to preponderate, and the news ele-

ment almost disappeared. The paper was discontinued from Jan. 2, 1711, perhaps because its semi-political character made Steele's position difficult under the Tory administration. But after a very short time it had a successor in the "Spectator," in which Addison played the leading part. The paper was to be non-political, and was to "bring philosophy out of the closets and libraries, schools and colleges, to dwell in clubs and assemblies; at tea-tables and in coffee-houses" (*Spectator* No. 10).

The first number appeared on March 1, 1711; the paper was issued daily until Dec. 6, 1712. In the "Tatler" the papers on different subjects had been dated from various clubs; in the "Spectator" the framework is supplied by an imaginary club grouped round the "Spectator." Mr. Spectator himself, whose character is portrayed in the first number, represents a new and more sober England, very different from the court circles of the time. He is learned, thoughtful, serious, yet with a pleasant humour; he frequents the coffee-houses, and his observant eye notes the new spirit growing up under the older forms of society. His fellow club members represent different types. Sir Roger de Coverley is the old English country gentleman; Sir Andrew Freeport represents the great London merchant class; Captain Sentry is the good-humoured soldier discharged in civil life; Will Honeycomb the man of fashion, while the Templar stands for learning and wit, and so on.

For nearly two years the "Spectator" delighted the town. The "Spectator" stood for reason and moderation in an age of bitter party strife, for clean living in an age when the English upper classes had not yet recovered from the licence of the Restoration, and in criticism for the best standards of its time. Addison and Steele were for a reconciliation of the harsh austerities of Puritanism with the careless profligacy of the Restoration. They were, in fact, great moralists. Samuel Johnson, whose political sympathies did not make him too friendly to Addison, paid his tribute to the lucidity and purity of his English style. "Whoever wishes to attain an English style," he said, "must give his days and nights to the volumes of Addison." And Macaulay speaks justly of Addison as the "consummate painter of life and manners," and of "the great satirist who alone knew how to use ridicule without abusing it; who, without inflicting a wound, effected a great social reform, and who reconciled wit and virtue, after a long and disastrous separation, during which wit had been led astray by profligacy and virtue by fanaticism." The "Spectator" includes the famous Saturday papers on Milton in which Addison applied the principles of Aristotelian criticism to Milton's work. However excessive his praise of Milton may seem (he placed him above Homer and Virgil), these papers had a great influence on criticism for a long period, and were translated into French and German.

Of the 555 papers in the "Spectator" Addison's numbered 274 against 236 written by Steele. W. J. Courthope estimated the circulation of the "Spectator" at 10,000—a very large number for those days—and the bound annual volumes had a further sale of 9,000. After the "Spectator," Steele projected the "Guardian," which was also to be non-political, but did not maintain its aloofness. Addison also contributed a few papers.

It is astonishing to some readers that Addison's tragedy of *Cato*, produced on April 13, 1713, should have been counted one of his best achievements. But the artificiality and frigidity of the piece, and its glaring faults even after the emendations of Pope and others, counted for very little against the political interest imported into the play. It was dedicated to the Duchess of Marlborough, and the liberal sentiments put into the mouths of Roman orators were taken as a glorification of Whig sentiments. It was interpreted as a defence of the Whigs and Marlborough against the Tories who were suspected of trying to undo the act of Settlement. *Cato* ran for 35 nights. It was translated into French and German, and Addison was praised by Voltaire as "the first Englishman who composed a regular tragedy and infused a spirit of elegance into every part of it." Voltaire's praise was partly due to Addison's strict adherence to the unity of place which his English contemporaries found unnatural and artificial.

From the cessation of the "Spectator" onwards, Addison's life, though outwardly increasingly prosperous, was clouded by various misunderstandings and quarrels. The rights and wrongs of Pope's quarrel with him (*see* POPE, ALEXANDER) are difficult to disentangle, and cannot be dealt with here. But Addison, who had established Button in a coffee-house in Covent Garden, held a little literary court there of which Budgell, Tickell, Carey and Phillips were members. Pope was not a member of the coterie, though it appears that he made a brief appearance there. In any case there was a complete breach. Pope wrote the famous lines on Atticus in the *Epistle to Dr. Arbuthnot* in which Addison is mercilessly attacked as "willing to wound, and yet afraid to strike," who "like Cato, gives his little senate laws, and sits attentive to his own applause." The *Epistle* was not published until after Addison's death, though he must have seen the lines.

On the accession of George I., Addison was appointed secretary to the lords justices entrusted provisionally with the conduct of the Government until the new King's arrival. He then became once more chief secretary for Ireland. He defended the Hanoverian succession against the Jacobite partisans in a new paper called the "Freeholder" which appeared bi-weekly between Dec. 23, 1715 and June 9, 1716. Probably in return for this service he was made one of the commissioners for trade and the colonies. In Aug. 1716 he married Charlotte, Countess dowager of Warwick, who brought her husband the occupancy of Holland House, Kensington. The common report that the marriage was a very unhappy one is based mainly on the evidence of Addison's enemies. The allegations that he was incompetent in the public service are derived from similar sources; but as one of the secretaries of State in the Sunderland cabinet (1717) he seems to have been a failure. He resigned on the plea of failing health in March 1718. In the same month he found himself ranged as a pamphleteer against his old friend Dick Steele. The contest was still proceeding when Addison died of dropsy, June 17, 1719. Steele's real love for his friend was shown in the letter to Congreve prefixed to Addison's anonymous comedy *The Drummer*, acted in 1716.

Addison's life was written in 1843 by Lucy Aikin. This was reviewed by Macaulay in July of the same year. A more modern study is that in the "Men of Letters" series by W. J. Courthope (1884). The *Spectator* (seven vols. 1712-13, the 8th being added in 1715), was frequently reprinted. There is a good modern edition, in eight vols. (1897-98) by G. Gregory Smith. Of the *Tatler* there is an edition by G. A. Aitken in eight vols. (1898). A complete edition of Addison's works (based upon Hurd) is included in Bohn's *British Classics*; Bonamy Dobree, *Essays in Biography* (1925).

ADDISON'S DISEASE, an affection manifesting itself in an exaggeration of the normal pigment of the skin, asthenia, irritability of the gastro-intestinal tract, and weakness and irregularity of the heart's action: these symptoms being due to loss of function of the suprarenal glands. It is important to note, however, that Addison's disease may occur without pigmentation, and pigmentation without Addison's disease. The condition was first recognized by Dr. Thomas Addison of Guy's Hospital, London, in 1855. But it remained for Schäfer and Oliver of University college, London, to demonstrate that the suprarenal glands contain a very powerful extract which produces toxic effects when administered to animals, and that an active principle "adrenalin" can be separated, which excites contraction of the small blood vessels and thus raises blood pressure. The latest views of this disease thus stand: (1) that it is entirely dependent on suprarenal disease, being the result of a diminution or absence of their internal secretion, or else of a perversion of their secretion; or (2) that it is of nervous origin, being the result of changes in or irritation of the large sympathetic plexuses in the abdomen; or else (3) that it is a combination of glandular inadequacy and sympathetic irritation.

The morbid anatomy shows (1) that in over 80% of the cases the changes in the suprarenals are tuberculous, usually beginning in the medulla and resulting in caseation; and that this lesion is bilateral and usually secondary to tuberculous disease elsewhere, especially of the spinal column. In the remaining cases (2) simple atrophy has been noted, or (3) chronic interstitial inflammation leading to atrophy; and finally (4) an apparently normal condition

of the glands, but the neighbouring sympathetic ganglia diseased or involved in a mass of fibrous tissue.

The onset of the disease is insidious and consists in a slow but increasing condition of weakness. There is a feeble and irregular action of the heart, resulting in attacks of syncope which may prove fatal. Blood pressure is low and anaemia may be great. From time to time there may be severe attacks of nausea, vomiting or diarrhoea. The best known, though a late, symptom is a gradually increasing pigmentation of the skin, ranging from a bronzy-yellow to brown or even occasionally black. This pigmentation shows itself (1) over exposed parts, as face and hands; (2) wherever pigment appears normally, as in the axillae and round the nipples; (3) wherever pressure is applied, as round the waist; and (4) occasionally on mucous membranes, as in the mouth.

The patient's temperature is usually sub-normal. The disease is commoner in males than in females, and among the lower classes than the upper. But this latter fact may be due to poor nourishment and bad hygienic conditions rendering the poorer classes more susceptible to tuberculosis.

The diagnosis is by no means easy. Pigmentation of the skin occurs in many conditions, but the presence of a low blood pressure with weakness and irritability of the heart and some of the preceding symptoms render the diagnosis fairly certain. The latest researches on the subject tend to indicate a more certain diagnosis in the effect on the blood pressure of administering suprarenal extract, the blood pressure of the normal subject being unaffected thereby, that of the man suffering from suprarenal inadequacy being markedly raised. The disease is treated by promoting the general health in every possible way: by diet; by tonics, especially arsenic and strychnine; by attention to the hygienic conditions; and always by the administration of one of the many preparations of the suprarenal gland extract.

"ADDLED PARLIAMENT," the name usually given to the English parliament which met on April 6, 1614, sat for two months of violent debate, and was finally dissolved by James I. without having passed a single bill. Seven years passed before another parliament was summoned.

"ADDRESS, THE," an English parliamentary term for the reply of the Houses of Parliament (and particularly of the House of Commons) to the speech of the sovereign at the opening of a new parliament or session. There are certain formalities which distinguish this stage of parliamentary proceedings. The "King's Speech" itself is divided into three sections: the first, addressed to "My Lords and Gentlemen," touches on foreign affairs; the second, to the "Gentlemen of the House of Commons," has reference to the estimates; the third, to "My Lords and Gentlemen," outlines the proposed legislation for the session. Should the sovereign in person open parliament, he does so in the House of Lords in full state, and the Speaker and members of the House of Commons are summoned there into the royal presence. The sovereign then reads his speech. If the sovereign is not present in person, the speech is read by commission. The Commons then return to their House, and an address in answer is moved in both Houses. But before this motion a bill is read *pro forma*, a survival of an ancient claim of the Commons to assert their right of deliberation on subjects other than the Crown's immediate cause of summons. The Government of the day selects two of its supporters in each House to move and second the address, and when carrying out this honourable task they appear in levee dress. Previous to the session of 1890-91, the royal speech was answered paragraph by paragraph, but "the address" is now moved in the form of a single resolution, thanking the sovereign for his most gracious speech. The debate on the address is used as a means of ranging over the whole Government policy, amendments being introduced by the Opposition. A defeat on an amendment to the address is generally regarded by the Government as a vote of no-confidence. After the address is agreed to it is ordered to be presented to the sovereign. The thanks of the sovereign for the address are then conveyed to the Lords by the lord steward of the household and to the Commons by the comptroller of the household.

ADDRESSING MACHINE: *see* OFFICE APPLIANCES.

ADE, GEORGE (1866–), American author, was born at Kentland, Ind., on Feb. 9, 1866. After graduating from Purdue University in 1887, he took up newspaper work in Lafayette, Ind., and Chicago (1887–1900). Although he belongs to the school of American vernacular humorists, he is definitely an urban product. Many of his early books, such as *Artie* (1896) and *Doc Horne* (1899) were designated as stories "of the streets and town" and were adapted from his newspaper contributions. His best-known book, *Fables in Slang* (1899), is clever and sophisticated. Ade has written a number of musical comedy librettos, film scenarios, including *Back Home and Broke* (1922), and plays, the best known of which are *The County Chairman* (1903), *The College Widow* (1904) and *Father and the Boys* (1908).

ADELAER or **ADELER**, the surname given to **KURT SIVERTSEN** (1622–75), Norwegian-Danish sailor. Born at Brevig, in Norway, he entered the Dutch navy and then the Venetian service, where he was known as *Curzio Suffrido Adelborst* (*i.e.*, Dutch for "naval cadet"). He commanded the Venetian squadron at the battle of the Dardanelles (May 13, 1654) when his ship alone sank 15 Turkish galleys and burned others. Next day he compelled the surrender of the Turks at Tenedos.

In 1660 he became admiral-lieutenant in the Venetian service, but in 1662 he was induced to take command of the Danish fleet. Under Christian V. he took command of the combined Danish fleets against Sweden, but he died suddenly before the expedition set out.

ADELAIDE (**ADELHEID**) (931–999), queen of Italy and empress, was the daughter of Rudolph II. of Burgundy, and married, in 947, Lothair, who succeeded his father Hugh as king of Italy. Lothair died in 950 and Adelaide was imprisoned at Como by his successor, Berengar II., marquis of Ivrea, who wished to compel her to marry his son Adalbert. After four months (August 951), she escaped, and took refuge at Canossa with Atto, count of Modena-Reggio. Meanwhile Otto I., the German king, whose English wife, Edgitha, had died in 946, came to Italy. Adelaide met him at Pavia, and at the close of the year the marriage took place. On Feb. 2, 962, she was crowned empress at Rome by Pope John XII. immediately after her husband, and she accompanied Otto in 966 on his third expedition to Italy, where she remained with him for six years.

After Otto I.'s death (May 7, 973), Adelaide exercised for some years a controlling influence over her son, the new emperor, Otto II. The causes of their subsequent estrangement are obscure, but it was possibly due to the empress's lavish expenditure in charity and church building, which was a serious drain on the imperial finances. In 978 she left the court and lived partly in Italy, partly with her brother Conrad, king of Burgundy, by whose mediation she was ultimately reconciled to her son. In 983, shortly before his death, she was appointed his viceroy in Italy, and, in concert with the Empress Theophano, widow of Otto II., and Archbishop Willigis of Mainz, defended the right of her infant grandson, Otto III., to the German crown against the pretensions of Henry the Quarrelsome, duke of Bavaria.

In June 984 the infant king was handed over by Henry to the care of the two empresses; but the masterful will of Theophano soon obtained the upper hand, and until the death of the Greek empress, on June 15, 991, Adelaide had no voice in German affairs. She assumed the regency, in concert with Archbishop Willigis and a council of princes of the Empire, and held it until in 995 Otto was declared of age. In 996 the young king went to Italy to receive the imperial crown; and from this date Adelaide devoted herself to pious exercises, to correspondence with the abbots Majolus and Odilo of Cluny, and to the foundation of churches and religious houses. She died on Dec. 17, 999, and was buried in the convent of Saints Peter and Paul, her favourite foundation, at Salz in Alsace. By the Emperor Otto I. she had four children: Otto II. (d. 983), Mathilda, abbess of Quedlinburg (d. 999), Adelheid (Adelaide), abbess of Essen (d. 974) and Liutgard, who married Conrad II., duke of Franconia, and died in 955.

BIBLIOGRAPHY.—Adelaide's life (*Vita* or *Epitaphium Adalheidae*

imperatricis) was written by St. Odilo of Cluny. It is valuable only for her later years, the rest of her life being merely outlined, though her adventures in escaping from Berengar are treated in more detail. The best edition is in Duchesne, *Bibliotheca Cluniacensis*, pp. 353–362. *See* Giov. Batt. Semeria, *Vita politico-religiosa di s. Adelaide, etc.* (Turin, 1842); Jul. Bentzinger, *Das Leben der Kaiserin Adelheid . . . während der Regierung Ottos III.*, Inaug. Dissertation (Breslau, 1883); J. J. Dey, *Hist. de s. Adelaide, etc.* (Geneva, 1862); F. P. Wimmer, *Kaiserin Adelheid, Gemahlin Ottos I. des Grossen* (Regensb., 1889); Wattenbach, *Deutschlands Geschichtsquellen* (Stuttgart and Berlin, 1904). *See* Chevalier, *Répertoire des sources historiques* (1903).

ADELAIDE, capital of South Australia, in the county to which it gives its name, is situated near the middle of the eastern side of St. Vincent gulf where the coast line curves farthest inland (eastwards). The genius of Sturt, and then of Light, the first surveyor-general, selected (1836) a site upon fertile plains which here sweep up very gently from the coast to a curving line of hills some 9m. inland. (Mt. Lofty, *c.* 7m. [air-line] E.S.E. of Adelaide, 2,334 feet.) Light chose, not without opposition, a spot on rising ground, close to the Torrens stream, the chief early source of water-supply, and within easy reach of a fair open roadstead (Holdfast bay, *c.* 6m.). Within 8m. also was the only considerable sheltered inlet along this recently elevated coast, the Port Adelaide "river," a deflected tidal estuary. This water—shallow, muddy, but improved by dredging—became the site of Adelaide's port until the construction of the outer harbour provided a more accessible anchorage for larger vessels near the mouth of the estuary and facing the open gulf. Southwards the hills close in upon the plain and meet the coast line, but northwards the lowlands stretch, broadening, up to and beyond the head of the gulf. Easy movement was possible also by various gaps and saddles to the Murray lowlands in the east and south-east, and Adelaide thus soon became an important nodal point for lines of movement by land and sea. The fertility of the plains—deep alluvium washed down from the torrent-scarred hills—the presence of minerals (though in relatively small quantities) in the hills, and the genial climate formed the basis of Adelaide's prosperity. A fairly regular rainfall of *c.* 21in. falling largely in the winter months (April–November); temperatures hot in summer (Jan. mean: 73°; highest recorded [shade] maximum 116°, with fairly frequent heat spells); but cool and bracing in winter (June mean: 52° with occasional frosts); land and sea breezes along the coast and much sunshine make up a typical Mediterranean climate.

The town was laid out by Light in the form of a square, divided into rectangular blocks with gardens and parks at the points of intersection. Around the square a mile-broad belt of park-land was reserved, and beyond these stretch the suburbs. The park-lands have been to some extent encroached upon for public buildings, but the remainder form the great playground and "lungs" of the city which claims to have no slums. The climate and the presence of the river Torrens, now artificially dammed and converted into a lake, lend Adelaide the peculiar charm of diversified vegetation; north-western European, southern European and sub-tropical.

After a somewhat chequered early history Adelaide, in virtue of its commanding situation in relation to all the more important southern parts of the State, steadily grew in prosperity and size. until, with 316,865 inhabitants, it had a decidedly alarming proportion (nearly 56%) of the total population of the State (1926), 566,394. Its commercially central position and good communications, ready supplies of raw materials and of imported coal, and a protective tariff have built up in the metropolitan area (particularly along the main lines to Port Adelaide) a number of flourishing young industries, manufacturing woollens, machinery, pottery, etc. To Adelaide gravitate the products of the agricultural and pastoral areas of the surrounding fertile districts, and thither also, for lack of a river-mouth port, come the bulk of the products—wool, wheat, fruit—of the lower Murray valley (*see* ALEXANDRINA, LAKE). The trade of Port Adelaide (1924–25: £25.9 million; 2,074 million tons) is five to six times as valuable as that of any other South Australian port, and fourth as regards value and tonnage amongst the ports of Australia.

The city possesses many fine buildings, including the

University, School of Mines, an Anglican and a Roman Catholic Cathedral, Exhibition Building and others. It was the birth-place of municipal government in Australia and gained a Lord Mayoralty in 1919.

ADELARD or **AETHELARD** of Bath (12th century), English scholastic philosopher. He studied in France and travelled in Spain, Italy, North Africa and Asia Minor, where he became acquainted with Arabian scholarship. He returned to England in the time of Henry I., and received an annual grant from the revenues of Wiltshire. Adelard translated Euclid's *Elements*, probably from an Arabic version. The work, which was published in Venice in 1482 under the name of *Campanus de Novara*, at once began to be used as a text-book in the schools. Adelard's special contribution to scholastic philosophy was the treatise *De eodem et diverso*, in which he enunciated the theory of "indifference." See SCHOLASTICISM.

It is in the form of a dialogue between himself and his favourite nephew, and was dedicated to Richard, bishop of Bayeux from 1113 to 1133. He wrote also a group of treatises on the astrolabe (a copy of which is in the British Museum), on the abacus (three copies exist in the Vatican Library, the library of Leyden University and the Bibliothèque Nationale in Paris), translations of the Kharismian Tables and an Arabic *Introduction to Astronomy*.

BIBLIOGRAPHY.—See Jourdain, *Recherches sur les traductions d'Aristote* (2nd ed., 1843); Hauréau, *Philosophie scolastique* (2nd ed., 1872), and works appended to art. SCHOLASTICISM.

ADELIE LAND, Antarctic land situated on the polar circle in longitude 140° E., discovered by the Frenchman Dumont d'Urville in 1840. The steep coasts, rising to heights of from 3,250 to 4,000 ft. are almost unapproachable. Although covered with snow and ice and completely uninhabited, it has possibilities of utilization for whale-fishing. (See also ANTARCTIC REGIONS.)

ADELSBERG: see POSTUMIA GROTTE.

ADELUNG, JOHANN CHRISTOPH (1732–1806), German grammarian and philologist, was born at Spantekow, in Pomerania, on Aug. 8, 1732. In 1787 he was made principal librarian to the elector of Saxony at Dresden, where he lived until his death on Sept. 10, 1806.

By his grammars, dictionary, and various works on German style, Adelung helped to rectify the orthography, refine the idiom, and fix the standard of his native tongue. His German dictionary—*Grammatisch-kritisches Wörterbuch der hochdeutschen Mundart* (1774–86)—bears witness to his intimate knowledge of the history of the different dialects on which modern German is based. No man before Jakob Grimm (*q.v.*) did so much for the language of Germany. At the time of his death Adelung was engaged on a work on general philology, entitled *Mithridates, oder allgemeine Sprachkunde*. Unfortunately he did not live to complete it. The first volume, which deals with the Asiatic languages, was published immediately after his death; the other two were issued under the superintendence of Johann Severin Vater (1771–1826).

ADEMPION, a taking away; in law, a revocation of a grant or bequest (see LEGACY).

ADEN, seaport and territory in Arabia, situated in 12° 45' N., and 45° 4' E., on a peninsula near the entrance to the Red sea, 100 m. east of the Strait of Bab-el-Mandeb. The peninsula of Aden has barren and desolate volcanic rocks, rising to 1776 ft. and extending 5 m. from east to west, and 3 m. from its northern shore to Ras Sanailah or Cape Aden, its most southerly point; it is connected with the mainland by a neck of low sandy ground. The town is built on the eastern coast, in what is probably the crater of an extinct volcano, and is surrounded by precipitous rocks forming an admirable natural defence. There are two harbours, an outer, facing the town, protected by the island of Sirah, but now partially choked with mud; and an inner, called Aden Back-bay, or, by the Arabs, Bandar Tawayih, on the western side of the peninsula, which at all periods of the year admits vessels drawing less than 20 feet. Aden suffers considerably from the want of good water, and the heat is often intense. A little water is obtained from wells, and some from an aqueduct 7 m. long, built in 1867.

Aden early became the chief entrepôt of trade between Europe and Asia. It is the *'Αραβία εὐδαίμων* of the Periplus. It was known to the Romans as *Arabia Felix* and *Attanae*, and was captured by them, probably in the year 24 B.C. In 1513 it was unsuccessfully attacked by the Portuguese under Albuquerque, but subsequently fell into the hands of the Turks in 1538. In the following century the Turks themselves relinquished their conquests in Yemen, and the sultan of Sana established a supremacy over Aden, which was maintained until 1735, when the sheikh of Lahej, throwing off his allegiance, founded a line of independent sultans.

From the 16th to the 19th century traffic between Europe and the East had mostly gone via the Cape of Good Hope. The an-

A CAMEL-CART IN ADEN. THIS CHARACTERISTIC VEHICLE IS THE USUAL MEANS OF CONVEYANCE; IT IS WELL ADAPTED FOR USE WHERE THE SURFACE IS IMPASSABLE TO MODERN TRANSPORT. PHOTO BY E. J. MORSE

nexation of Aden to British India in 1839 renewed trade between India and the Red sea and this developed enormously after the cutting of the Suez canal. Aden was made a free port and a coal-ing station and its territory has been extended by cession or purchase. The island of Perim in the Strait of Bab-el-Mandeb was occupied in 1857. In addition to its east and west trade Aden has many commercial relations with the interior and with the coast of Africa opposite.

The chief imports are coffee, cotton-piece goods, grain, hides, coal, sugar and tobacco. The exports are, in the main, the same as the imports. Aden itself produces salt and cigarettes. The trade is largely a transhipment trade. In 1925–26 the total value of imports was Rs.8,98,19,456, of which Rs.28,20,660 was land-borne; and of exports Rs.7,52,67,613, of which Rs.29,00,581 was land-borne, as compared with imports valued at Rs.6,56,62,230 and exports at Rs.6,62,36,935 in 1913–14. In 1925–26, 1,315 merchant vessels of 4,356,326 tons (net) entered the port of Aden besides 1,029 local craft. The submarine cables of the Eastern Telegraph Company here diverge—on the one hand to India, the Far East and Australia, and on the other hand to Zanzibar and the Cape. During the war of 1914–18 a metre-gauge railway was constructed for military purposes from Aden to Lahej, 26 miles. Later it was extended to Habil, a further eight miles. The total population of the settlement in 1921 including Perim island was 54,923 (including about 500 Europeans) as compared with less than 1,000 in 1839.

Boundaries and Administration.—The frontier of the protectorate was demarcated in 1902–04, and in 1905 a convention was signed by the British and Ottoman commissioners determining the boundary from Sheikh Murad on the Red sea coast to the Bana river, and thence in a north-easterly direction into the desert. By an Anglo-Turkish Convention of 1914 the boundary was prolonged to a point on the shores of the Persian gulf opposite Bahrain island. During the World War, the Turkish forces encroached on Aden territory and approached to within a short distance of the town; they occupied Lahej and Sheikh Othman. At the end of the war the Turks withdrew from the Yemen. The neighbouring territories of the Iman of San'a conform, theoretically, with the 1905 line, though encroachments had been made at some points which, in 1925, were the subject of dispute.

For internal administrative purpose Aden is under the control of the Government of Bombay and, ultimately, of the Government of India. The political relations of Aden with the rest of Arabia and with the tribes of the protectorate were taken charge of during the World War by the high commissioner of Egypt. In

1920 political control was transferred to the political resident, who was directly responsible to the British Foreign Office. In 1921 this responsibility was taken over by the Colonial Office. It has been further agreed that for the future London shall be entirely responsible for the political and military administration, the Government of India remaining responsible for the internal administration. It was also decided that from 1927 the Government of India should contribute a fixed sum for three years towards military and political charges and thenceforward one-third of these charges, subject to a fixed maximum.

ADENÈS, ADENEZ or **ADANS**, surnamed *Le Roi*, French trouvère, was born in Brabant about 1240. He owed his education to the kindness of Henry III., duke of Brabant, and he remained in favour at court for some time after the death (1261) of his patron. In 1269 he entered the service of Guy de Dampierre, afterwards count of Flanders, probably as *roi des ménestrels*, and followed him in the next year on the abortive crusade in Tunis. The expedition returned by way of Sicily and Italy, and Adenès left in his poems some very exact descriptions of the places through which he passed.

The poems written by Adenès are four: the *Enfances Ogier*, *Berte aus grans piès*, *Bueves de Comarchis*, and a long *roman d'aventures*, *Cléomadès*, borrowed from Spanish and Moorish traditions brought into France by Blanche, daughter of Louis IX. Adenès probably died before the end of the 13th century.

BIBLIOGRAPHY.—The romances of Adenès were edited for the Académie Impériale et Royale of Brussels by A. Scheler and A. van Hasselt in 1874; *Berte* was rendered into modern French by G. Hecq (1897) and by R. Périé (1900); *Cléomadès*, by Le Chevalier de Chatelain (1859). See also the edition of *Berte* by Paulin Paris (1832); an article by the same writer in the *Hist. Litt. de la France*, vol. xx. p. 679-718; Léon Gautier, *Les épopées françaises*, vol. iii. etc.

ADENINE occurs in the pancreas and widely elsewhere in the animal kingdom, as well as in beer yeast and tea leaves. It has been prepared synthetically and also by decomposition of nucleic acids and other complex animal substances. It is a colourless solid, crystallizing with three molecules of water, and melting, with decomposition, at 360-365° C. It is a purine base, 6-amino purine (C₅H₅N₅).

(See **PURINES**.)

ADENOIDS, or adenoid growths, masses of soft, spongy tissue between the back of the nose and throat, occurring mostly in young children; blocking the air-way, they prevent the due inflation of the lungs and the proper development of the chest. The growths are apt to keep up a constant catarrh near the orifice of the ventilating tubes which pass from the throat to the ear, and so render the child dull of hearing or even deaf. They also give rise to asthma, and like enlarged tonsils—with which they are often associated—they impart to the child a vacant, stupid expression, and hinder his physical and intellectual development. They cause him to snore at night, his voice is "stuffy," thick, and unmusical. Though, except in the case of a cleft palate, they cannot be seen with the naked eye, they are often accompanied by a visible and suggestive granular condition of the wall at the back of the throat.

If the child continues to breathe with his mouth open and to snore at night, if he remains deaf and dull, and is troubled with a chronic "cold in his head," the question of thorough exploration of the naso-pharynx and of a surgical operation should most certainly be considered. The comparatively simple operation for their removal results, as a rule, in marked benefit, but this treatment should always be followed by a course of instruction in respiratory exercises.

ADEPT (if used as a substantive pronounced *adept*, if as an adjective *adept*), completely and fully acquainted with one's subject, an expert. (Lat. *adeptus*, one who has attained.) The word implies more than adequate proficiency, a natural inborn aptitude. In olden times an adept was one who was versed in magic, an alchemist.

ADERNO, town of the province of Catania, Sicily, 22m. by rail N.W. of the town of that name. Pop. (1921) 39,765. Anciently Adranon (the original Siculan settlement was perhaps some 5m. away), it took its name from Adranos, an indigenous

deity, in Roman times identified with Vulcan, to whom was dedicated a temple guarded by 1,000 huge dogs. Substructures of the temple may persist outside the town. The town, founded by Dionysius I. (c. 400 B.C.), has fine remains of its walls (see P. Orsi in *Not. Scavi*, 1915, p. 227). For a time it was the headquarters of Timoleon, and it was the first town taken by the Romans in the First Punic War (263 B.C.). In the centre of the modern town rises the castle, built by Roger I.

ADES are non-alcoholic beverages made from the juice of lemons, oranges or limes, powdered sugar or syrup and plain, mineral or carbonated water. Usually a maraschino cherry and cracked ice are added, and a straw through which to sip the drink. They are sold in the United States chiefly at soda fountains and drug stores. A departure of the last decade that grows in popular favour is that of serving "orange drinks" at street stands and corner shops. Pineapple "drinks" have more recently come to be handled in the same way and give promise of similar success. A still later innovation is that of extracting the juices of the orange or the lemon through electrical machines installed at soda fountains. The advantage in this method lies in the fact that the customer sees with his own eyes the fresh fruit and the resulting unadulterated juice. It has been estimated that through the California and Florida fruit exchanges 56,000 of these extracting machines have already been distributed, and that in this way the United States used 3,000,000 boxes of the fresh fruit annually.

ADEVISM, a term introduced by Max Müller to imply the denial of gods (Skt. *deva*), on the analogy of Atheism, the denial of God (see Gifford Lectures, 1892, c. ix.).

ADHĀN: see **AZĀN**.

ADHÉMAR DE CHABANNES (c. 988-c. 1030), mediaeval historian, was born at Chabannes, France. He was a monk of the monastery of St. Cybard, Angoulême, and died, probably at Jerusalem, where he was on pilgrimage. Adhémar's principal work, *Chronicon Aquitanicum et Francicum* or *Historia Francorum*, is in three books and deals with Frankish history from the fabulous reign of Pharamond, king of the Franks, to A.D. 1028. The two earlier books are scarcely more than a copy of the *Gesta regum Francorum*, but the third, dealing with the period from 814 to 1028, is of considerable historical importance, and is published in the *Monumenta Germaniae historica*, *Scriptores*, iv. (Hanover and Berlin, 1826-92). Other writings of Adhémar's are published by J. P. Migne in the *Patrologia Latina*, tome cxli. (Paris, 1844-55).

See F. Arbellot, *Étude historique et littéraire sur Adémar de Chabannes* (Limoges, 1873); J. F. E. Castaigne, *Dissertation sur le lieu de naissance et sur la famille du chroniqueur Adémar moine de l'abbaye de St. Cybard d'Angoulême* (Angoulême, 1850).

ADHEMAR (ADEMAR, AIMAR, AELARZ) DE MONTEIL (died 1098), crusader, was bishop of Puy en Velay from before 1087, and accompanied Raymond IV., count of Toulouse, to the East as apostolic legate. He negotiated with Alexis Comnenus at Constantinople, re-established at Nicaea some discipline among the crusaders, caused the siege of Antioch to be raised, and died in that city of the plague.

BIBLIOGRAPHY.—See the article by C. Kohler in *La Grande Encyclopédie; Bibliographie du Velay* (1902), 640-50.

ADHESIVE CEMENTS: see **CEMENT**.

ADIABATIC CHANGE, a change in the physical state of a body, whether this change be one of volume, strain, electric charge, etc., which involves no passage of heat to or from the body. (See **THERMODYNAMICS**.)

ADIABATIC LAPSE of temperature of the atmosphere, the limiting rate of decrease of temperature with increasing height consistent with convective (or neutral, or adiabatic) equilibrium. In temperate regions the state of the atmosphere is in convective equilibrium and the adiabatic lapse corresponds to a fall of 1° C for each increase in height of 100 metres. (See **THERMODYNAMICS** and **METEOROLOGY**.)

ADIAPHORISTS, the name of a party in the religious controversies of the 16th century in Germany. The Adiaphorist controversy among Lutherans was an issue of the provisional scheme of compromise between religious parties, drawn up by

Charles V., sanctioned at the Diet of Augsburg, May 1548, and known as the Augsburg Interim. It satisfied neither Catholics nor Protestants. As head of the Protestant party the young elector Maurice of Saxony negotiated with Melancthon and others, and at Leipzig, Dec. 1548, secured their acceptance of the Interim as regards *adiaphora* (things indifferent), points neither enjoined nor forbidden in Scripture. This sanctioned jurisdiction of Roman Catholic bishops and observance of certain rites, while all were to accept justification by faith (relegating the words "by faith alone" to the *adiaphora*). Passionate opposition was led by Melancthon's colleague, Matthias Flacius, on the grounds that the imperial power was not the judge of *adiaphora*, and that the measure was a trick to bring back popery. From Wittenberg he fled, April 1549, to Magdeburg, making it the headquarters of rigid Lutheranism. Practically, the controversy was concluded by the religious peace ratified at Augsburg (Sept. 1555), which left princes a free choice between the rival confessions with the right to impose either on their subjects; but much bitter internal strife was kept up by Protestants on the theoretical question of *adiaphora*; to appease this was one object of the Formula Concordiae, 1577. Another *Adiaphorist* controversy between Pietists and their opponents, respecting the lawfulness of amusements, arose in 1681, when Anton Reiser (1628-86) denounced the opera as anti-Christian.

See Herzog-Hauck, *Realencyklopädie* (3rd ed.); and Hastings, *Encyclopaedia of Religion and Ethics*, art. "Adiaphorism," where the connection of this historic question with the fundamental question of what is vital or essential is shown. For an earlier study, on rigorist lines, see E. Schmid, *Adiaphora, wissenschaftlich u. historisch untersucht* (1899).

ADIGE, river, North Italy. The Adige rises in small lakes on The Resia (Reschen Scheideck) Pass (4,902ft.), and near Glorenza is joined by tributaries where roads over the Ofen and Stelvio Passes fall in. It flows E. to Merano, and S.E. to Bolzano, where it receives the Isarco (6ft.), and becomes navigable. Turning S.W., and receiving the Noce (right) and the Avisio (left), it enters Lombardy, 13m. S. of Rovereto. It falls into the Adriatic at Porto Fossone, a few miles N. of the Po. The most considerable towns on its banks (south of Bolzano) are Trento, Rovereto, Verona and Legnago. It is very rapid, with sudden floods which do great damage. In Lombardy it is 200yds. wide, and 10 to 16ft., deep, but the strong current impedes navigation. The Adige is 220m. long and, after the Po, the most important river in Italy. In Roman times its lower course lay much farther north than now, along the base of the Euganean hills, and it entered the sea at Brondolo. In A.D. 587 the river broke its banks and took its present course, but new streams opened repeatedly to the south, until now the Adige and Po form one delta.

ADIGEI, CHERKES, autonomous area in the north Caucasian region of the R.S.F.S.R., created July, 1922. It is a narrow strip of territory lying north and south of lat. 45° and curving south at about long. 41° E., forming an autonomous island in the north Caucasian area, mainly along the south banks of the Kuban river and Laba river, from west of Krasnodar to south of Labinsk. It was formerly part of the Kuban province. The Kuban river is navigable to its confluence with the Laba river but is malarial and swampy and frequently floods its banks. The population 114,176 (1926) is entirely rural and is administered from Krasnodar, for which purpose it is divided into the following sections:—Dzhidzhikhabsk (18,064), Natyrbovsk (22,229), Preobrazhensk (27,608), Takhtamykaevsk (20,228), Khakyrino-Khabalsk (30,055). The Adigei or Adyghei (their own name) or Cherkess (their Russian name) are Circassians who formerly occupied the mountain valleys but were compelled by Russia in 1861 either to settle on the flat land or to emigrate (200,000 settled in Turkey, as the Bashi-Bazouks). They are mainly Alpine in physical type and speak a non-Aryan language related to Abkhasian and Kabard. Their religion was Mohammedan, mingled with old heathen and modern Christian rites. Cattle and sheep-rearing were their chief occupations, and great respect to seniority and hospitality, and fierce vendettas, were characteristic. Their present habitat is on the southern limit of the black earth

steppe region where it merges into the broad-leaved, deciduous forest and they are now mainly agricultural, with wheat, maize and sunflower seed as the chief crops, and consequently their old customs are rapidly dying out.

ADIPOCERE, a substance into which animal matter is sometimes converted (from the Lat. *adeps*, fat, and *cera*, wax), and so named by A. F. Fourcroy, from its resemblance to both fat and wax. When the Cimetière des Innocens at Paris was removed in 1786-87, great masses of this substance were found where the coffins containing the dead bodies had been placed very closely together. Chemically, adipocere consists principally of a mixture of palmitic, margaric and oxymargaric acids combined with a little ammonia; glycerine appears to be absent (*see also* under GLYCERIDES). Lime, derived from the tissues, is present with other substances as an inorganic residue. It appears that it is not formed from protein, but from the body fats which collect together and undergo decomposition.

ADIPOSE TISSUE is composed of specialized connective tissue cells which contain large globules of fat. The chief chemical constituents of this fat are the neutral glycerol esters of stearic, oleic and palmitic acids. The fat stored in these cells comes in part directly from the fats eaten, and in part is manufactured within the body from fats and carbohydrates in the food and sometimes from protein. The main reservoir of fat in the body is the adipose tissue beneath the skin, called the *panniculus adiposus*. There are also deposits of fat between the muscles, among the intestines and in their mesentery, around the heart, and elsewhere. Beside acting as a fuel reserve against times of starvation or great exertion the *panniculus adiposus* conserves the heat of the body. Fat also seems to be a factor in resistance to disease, since undernourished people are more prone to infections than those in a good state of nutrition.

ADIRONDACKS, a group of mountains in north-eastern New York, U.S.A., in Clinton, Essex, Franklin and Hamilton counties, often included by geographers in the Appalachian system, but pertaining geologically to the Laurentian highlands of Canada. Unlike the Appalachians, the Adirondacks do not form a connected range, but consist of many summits, isolated or in groups, arranged with little appearance of system. There are about 100 peaks, ranging from 1,200 to more than 5,000ft. in height, and 42 more than 4,000ft.; the highest peak, Mt. Marcy (called by the Indians Tahawus or "cloud-splitter"), is near the eastern part of the group and attains an elevation of 5,344ft. Other high peaks are McIntyre, 5,112ft.; Skylight, 4,920; Haystack, 4,918; and Whiteface, 4,872. These mountains, consisting of various sorts of gneiss, intrusive granite and gabbro, have been formed partly by faulting but mainly by erosion, the lines of which have been determined by the presence of faults or the presence of relatively soft rocks. The mountains form the water-parting between the Hudson and the St. Lawrence rivers. On the south and south-west the waters flow either directly into the Hudson, which rises in the centre of the group, or else reach it through the Mohawk. On the north and east the waters reach the St. Lawrence by way of Lakes George and Champlain, and on the west they flow directly into that stream or reach it through Lake Ontario. The most important rivers within the area are the Hudson, Black, Oswegatchie, Grass, Raquette, Saranac and Ausable. Among the larger lakes are the Upper and Lower Saranac, Big and Little Tupper, Schroon, Placid, Long, Raquette and Blue Mountain. The surface of most of the lakes lies at an elevation of over 1,500ft. above the sea; their shores are usually rocky and irregular, and the wild scenery within their vicinity has made them very attractive to the tourist.

The region known as the Adirondack Wilderness, or the Great North Woods, embraces between 5,000 and 6,000 sq. m. of mountain, lake, plateau and forest, which for scenic grandeur is almost unequalled in any other part of the United States. Railways and highways penetrate the heart of the region and small boats ply upon the larger lakes. Well-marked trails lead to the crests of the better-known peaks. The mountains are easily reached from Plattsburg, Port Kent, Herkimer, Malone and Saratoga Springs. Every year thousands spend the summer

months in the wilderness, where cabins, hunting lodges, villas and hotels are numerous. The resorts most frequented are in the vicinity of the Saranac and St. Regis lakes and Lake Placid.

In the Adirondacks are some of the best hunting and fishing grounds in the eastern United States. At the head of Lake Placid stands Whiteface mountain, from whose summit one of the finest views of the Adirondacks may be obtained. Two miles south-east of this lake, at North Elba, is the old farm of the abolitionist John Brown, which contains his grave and is much frequented by visitors. Lake Placid is the principal source of the Ausable river, which for a part of its course flows through a rocky chasm from 100 to 175 ft. deep and rarely over 30 ft. wide. At the head of the Ausable chasm are the Rainbow falls. Another impressive feature of the Adirondacks is Indian pass, a gorge about 11 m. long, between Mt. McIntyre and Wallface mountain, a majestic cliff rising vertically from the pass to a height of 1,300 feet. Keene valley, in the centre of Essex county, is another picturesque region, presenting a pleasing combination of peaceful valley and rugged hills. Though the climate during the winter months is very severe—the temperature sometimes falling as low as -42° —it is beneficial to persons suffering from pulmonary troubles and a number of sanatoria have been established. The region is heavily wooded with spruce, hemlock, pine and hardwood trees. Lumbering has been much restricted by the creation of a State forest preserve, containing in 1927, 1,884,643 ac., and by the purchase of large tracts for game preserves and recreation grounds by private clubs. The so-called Adirondack park, containing over 3,000,000 ac., includes most of the State preserve and large areas held in private ownership.

See S. R. Stoddard, *The Adirondacks Illustrated* (1894); T. M. Longstreth, *The Adirondacks* (1917), and the *Reports of the New York State Geologist* and the *Bulletins of the New York State Museum*.

ADIT. An adit is the name given to a horizontal working made from the surface to strike a seam of coal or a mineral vein. Other names for an adit are "day drift," "day hole" surf (Forest of Dean), "sough" (lead mines of Derbyshire), "water-gates" (north of England), "sorre" (Yorkshire), "aridod" and "audit" as well as adit. Mining by means of adits is very ancient, and was practised in hilly country where the seams were cut by valleys. It was perhaps the earliest method of mining. The adits were driven at such a level as to drain off the water from the workings. The figure shows a seam coal outcropping on the side of a hill with ventilating shaft and adit level.

THE LOWER TUNNEL, WHICH IS HORIZONTAL, REPRESENTS AN ADIT CUT ACROSS THE STRATA, TO "WIN" AND DRAIN A COAL SEAM

Sometimes the coal was carried up the shaft on the backs of men or women climbing up ladders, or by means of a jack-roll worked by manual labour. The coal was worked by means of narrow passages driven in the coal, small pillars being left for the support of the roof. The extent to which working was possible was limited by three factors: lack of ventilation, crush of pillars and water difficulties. Mechanical ventilation was not practised. A fire was placed in the shaft to heat the air and so increase the air current. The pillars were made very small with a view to getting as much coal as possible, and as the area worked extended, a point was reached at which the support offered by the pillars of coal became insufficient and a crush of the superincumbent strata supervened, inducing a "creep" or heaving up of the floor, if the floor were a soft fireclay. If the floor was hard, a "thrust"

took place and the pillars were crushed. The methods of raising the water from the dip workings to the water level or adit being by means of pumps worked by manual labour, it was not possible to proceed far to the dip from beyond the point where the adit struck the seam of coal, or as it was termed beyond "the line of free drainage."

Where the ground was flat, working by adits was not possible, so that it was usual, in very early times, to get the coal by means of bell pits (*q.v.*) sunk near the outcrop. (R. R.)

ADJECTIVE, a word used chiefly in its grammatical sense of limiting or defining the noun to which it refers (Lat. *ad-jacio*, to throw to). Grammarians used to speak of a noun and its adjective together as a noun-adjective. In the art of dyeing, adjective colours are those which require mixing with some basis to render them permanent.

ADJECTIVE LAW. This term means the law of procedure and distinguishes it from the substantive law which it is designed to enforce, the former being viewed as the machinery by means of which the latter is brought into operation.

ADJOURNMENT, the act of postponing a meeting of any private or public body, particularly of parliament, or any business, until another time, or indefinitely (in which case it is an adjournment *sine die*). The word applies also to the period during which the meeting or business stands adjourned.

ADJUDICATION, generally a trying or determining of a case by the exercise of judicial power; a judgment. In a more technical sense, in English and American law, an adjudication is an order of the bankruptcy courts by which a debtor is adjudged bankrupt and his property vested in a trustee. It usually proceeds from a resolution of the creditors or where no composition or scheme of arrangement has been proposed by the debtor. It may be said to consummate bankruptcy, for not till then does a debtor's property actually vest in a trustee for division among the creditors, though from the first act of bankruptcy till adjudication it is protected by a *receiving order*. As to the effect which adjudication has on the bankrupt, *see* under **BANKRUPTCY**. The same process in Scots law is called sequestration. In Scots law the term "adjudication" has a technical meaning, being the name of that diligence by which a creditor adjudges the heritable estate of his debtor, in order to appropriate it to himself either in payment or security of his debt. The term is also applied to an action of the same nature by which the person beneficially entitled to a right may obtain a legal title to it.

In some foreign legal systems, adjudication means the judicial decision which determines the ownership of a disputed thing, or the shares therein, or the extent of ownership, as in the case of disputed boundaries, following in this the usual meaning of *adjudicatio* in Roman law.

ADJUNCT, that which is joined on to another, not an essential part, and inferior to it in mind or function, but nevertheless amplifying or modifying it. (Lat. *ad*, to, *jungere*, to join.) Adverbs and adjectives are adjuncts to the words they qualify. Twelve members of the Royal Academy of Sciences in Paris are called "adjuncts."

ADJUSTMENT: *see* AVERAGE; BONDS.

ADJUTANT, a helper or junior in command, one who assists his superior, especially an officer who acts as an assistant to the officer commanding a battalion or unit of similar scale. In the British army the appointment of adjutant is usually held by a captain or lieutenant. The adjutant acts as staff officer to the commanding officer, issues his orders, superintends the work of the orderly room and the general administration of the corps, and is responsible for the training of recruits. Regular officers are appointed as adjutants to units of the Territorial army. In the French army, however, the title is given to senior under-officers of superior grade to sergeant. On the European Continent the word is not restricted to the lower units of organization; for example, in Germany the *Adjutantur* includes all "routine" as distinct from "General" staff officers in the higher units, and the aides-de-camp of royal persons and of the higher commanders are also styled adjutant-generals, flügel-adjutanten, etc.

ADJUTANT BIRD, the name given to large storks of the genus *Leptoptilus*, distinguished by their dull plumage, black scabrous head and enormous pouch, of doubtful function, connected with the respiratory system. The largest is *L. dubius* of India. It feeds on offal, frogs and fish, and is a most efficient scavenger, for which reason it is usually protected. Other species are *L. javanicus* of south-east Asia and *L. crumenifer*, the marabout stork of Africa; the "marabout" feathers of commerce were originally the under-tail coverts of this bird, but the name is now applied to a large number of kinds of downy feathers.

ADJUTANT-GENERAL, an army official, originally (as indicated by the word) the chief assistant (Lat. *adjuvare*) staff-officer to a general in command, but now a distinct high functionary at the head of a special office in the British and American war departments. In England the second military member of the Army Council is styled adjutant-general to the forces. He is a general officer and at the head of his department of the War Office, which is charged with all duties relative to personnel. The adjutant-general of the United States Army is one of the principal officers in the war department, the head of the bureau for army correspondence, with the charge of the records, recruiting, issue of commissions, etc. Individual American states also have their own adjutant-general, with cognate duties regarding the state militia. In many countries, such as Germany and Russia, the term has retained its original meaning of an officer on the personal staff, and is the designation of personal *aides-de-camp* to the sovereign.

ADLER, CYRUS (1863–), American scholar and educator, was born in Van Buren, Ark., on Sept. 13, 1863. He graduated at the University of Pennsylvania in 1883 and received the degree of doctor of philosophy in 1887 from Johns Hopkins university, in which, from 1884 to 1893, he was an instructor and associate professor of Semitic languages. He was librarian in 1892–1905 and assistant secretary in 1905–08, of the Smithsonian Institution, Washington. From 1889 to 1908 he was curator of historic archaeology and historic religions in the U.S. National Museum. He became president of Dropsie college, Philadelphia, in 1908, and was acting president of the Jewish theological seminary of America, New York city, from 1916 until 1924, when he was made president. In 1892 he founded the Jewish Historical Society of America. He was one of the editors of the *Jewish Encyclopaedia* and in 1899 was made editor of the *Jewish Year Book*. His writings include numerous articles on Assyriology, oriental archaeology, Semitic philology, comparative religion, bibliography and American Jewish history.

Among his published works are *The Shofar, Its Use and Origin* (1893); *Told in the Coffee House*, with Allen Ramsay (1898); *International Catalogue of Scientific Literature* (1905); *Jews in the Diplomatic Correspondence of the United States* (1906); *Jacob Henry Schiff* (1921); and "The Beginnings of Semitic Studies in America" in *Oriental Studies* (Baltimore, 1926).

ADLER, FELIX (1851–), American educationalist, was born at Alzey, Germany, Aug. 13, 1851. His father, a Jewish rabbi, emigrated to the United States in 1857, and the son graduated at Columbia college in 1870. After completing his studies at Berlin and Heidelberg, he became, in 1874, professor of Hebrew and Oriental literature at Cornell university. In 1876 he established in New York city the Society for Ethical Culture, to the development and extension of which he devoted a great deal of time and energy, and before which he delivered a regular Sunday lecture. In 1902 he became professor of political and social ethics at Columbia university. He also acted as one of the editors of the *International Journal of Ethics*. Under his direction the Society for Ethical Culture became an important factor in educational reform in New York city, exercising through its technical training school and kindergarten (established in Jan. 1878) a wide influence. Dr. Adler also took a prominent part in philanthropic and social reform movements, such as the erection of model tenement houses and the abolition of child labour. He published *Creed and Deed* (1877), *The Moral Instruction of Children* (1892), *Marriage and Divorce* (1905), *The Religion of Duty* (1905), *The World Crisis and Its Meaning* (1915), *An Ethical Philosophy of Life* (1918), and *The Reconstruction of the Spiritual Ideal* (Hilbert lectures at Oxford, 1923).

ADLER, FRIEDRICH (1879–), Austrian politician, was born in Vienna July 9, 1879, the son of Viktor Adler (q.v.). From 1907 to 1911 he was lecturer in physics at the University of Zürich, but he was soon immersed in politics. From 1911 to 1916 he was secretary of the Austrian Social Democratic Party and editor of the monthly *Kampf*. During the World War he was in close sympathy with the Socialists of the Left. In despair over the break-up of the International, as a protest against war and a sign of proletarian feeling against it, he shot the Austrian prime minister, Count Stürgkh, on Oct. 21, 1916. On May 19, 1917 a special tribunal condemned him to death, but his sentence later was commuted to 18 years' imprisonment. He was, however, amnestied on Nov. 1, 1918. In 1919 he was elected to the National Assembly, and became vice-president of the committee of the Social Democratic Party and of the Union of the Social Democratic deputies. He became secretary of the International Working Union of Socialist Parties (the "2½" International), and after its absorption in the Second International (which changed its name to "Labour and Socialist International" at Hamburg in 1923) became secretary of the latter body also.

Adler's chief works are: *Die Erneuerung der Internationale* (1918); *Ernst Mach's Ueberwindung des mechanischen Materialismus* (1918); *Ortszeit, Systemszeit, Zonenzeit und das ausgezeichnete Bezugssystem der Elektrodynamik, eine Untersuchung über die Lorentzische und die Einsteinsche Kinematik* (1920).

See *Friedrich Adler vor dem Ausnahmegericht* (1923).

ADLER, HERMANN (1839–1911), British chief rabbi, born at Hanover on May 30, 1839, the son of N. M. Adler, was educated at University College school and University college, London, and then at Prague under Dr. Rapoport. After receiving the rabbinical diploma at Prague, he returned to England, to become temporary principal of the Jewish theological college in London for two years. With this college he was associated in one capacity or another all his life. He began his ministry at the Bayswater synagogue in 1864, and continued to preach there until 1891, when he became chief rabbi on the death of his father. Dr. Adler was a prominent figure in English public life, and served on many Mansion House committees and on various bodies concerned with the improvement of social conditions in London. He died on July 18, 1911. A collection of his sermons, entitled *Anglo-Jewish Memories and Other Sermons*, was published in 1909.

His daughter, NETTY, sat on the London County Council for Central Hackney from 1910–25, and was deputy chairman of the council in 1922–23. She served on many committees in connection with social questions, but her principal work was done in education. She began her social work as a school manager under the local school board, was then co-opted a member of the London Education Committee 1905–10, and in the County Council was closely connected with the administration of the schools. Apart from education, she was interested in the welfare of children from all points of view, having been for many years joint honorary secretary on the committee for the protection of wage earning children, and a member of the London Advisory Council for Juvenile Employment.

ADLER, NATHAN MARCUS (1803–1890), British chief rabbi, was born at Hanover, Jan. 15, 1803, and died at Brighton, England on Jan. 21, 1890. He took his degree of Ph.D. at Erlangen in 1828. He was ordained in the same year, was chief rabbi of Oldenburg (1829), and of Hanover in 1830, and on Oct. 13, 1844, was elected chief rabbi in London. Here he originated and carried out his scheme for a Jew's college for the training of teachers, which was founded in London on Nov. 11, 1855, with himself as its first president. In 1860 Adler suggested the establishment of a United Synagogue which should bring all the British congregations under one central administration; this idea was realized in 1870, when the United Synagogue bill was passed in parliament. Adler's writings include sermons and commentaries on Hebrew texts, the best known of which is *Nethinah la-ger*, a commentary on the Aramaic paraphrase of Onkelos on the Pentateuch (1874).

ADLER, VIKTOR (1852–1918), Austrian politician, was born at Prague, June 24, 1852. He began to occupy himself early with political and social questions. In 1883 he went to study in

Switzerland and in London, where he came into close touch with Engels. On his return to Vienna, however, he turned entirely to politics. The Workmen's party had sunk into political insignificance and Adler's task was to restore unity in the ranks of labour. In 1886 appeared his paper *Gleichheit*, eventually succeeded by *Die Arbeiterzeitung*, the principal organ of the Social Democratic party, which Adler continued to conduct till his death. In July 1889 he appeared at the first congress of the Second International, of which he became an official, as the representative of the united Austrian Labour party. From that time he was the acknowledged leader of the party.

Adler regarded it as his first task to secure for the workers representation in Parliament, but it was not until 1907 that he was able to secure universal and equal suffrage. The Social Democratic party increased their representation from 11 deputies to 87. Adler himself entered the Diet of Lower Austria in 1902, and in 1905 was elected to the Reichsrat, where, until his death, he played an important part.

In the congress and in the secretariat of the International, Adler, with Jaurès and Bebel, played the most prominent part, whether as leader, adviser, or mediator. After the collapse of Austria in 1918 at the constituent session of the provisional German-Austrian National Assembly, he read the declaration of the Social Democrats, in which they expressed their willingness, in association with the other German-Austrian parties, to build the new State on the basis of democracy and self-determination, without prejudice to a possible association with the German Empire. He held for a few days the office of foreign minister, but he broke down and died Nov. 12, 1918, the day on which the State council had decided to proclaim German Austria a democratic republic, and an integral part of the German Reich.

BIBLIOGRAPHY.—His works include articles scattered in various newspapers, in the *Neue Zeit*; *Kampf*; *Deutsche Worte* (Vienna), in addition to those in the *Arbeiterzeitung*; pamphlets, among which are *Die Fabrikinspektion, insbesondere in England und der Schweiz* (1884); *Die Arbeiterkammern und die Arbeiter* (1886); *Die Gleichheit vor dem Ausnahmegericht* (1889); *Das allgemeine, gleiche und direkte Wahlrecht und das Wahlrecht in Oesterreich* (1893); *Schwurgerichtsprozess gegen Doktor Viktor Adler wegen Verbrechens der Störung der öffentlichen Ruhe* (1894); *Alkoholismus und Gewerkschaft* (many editions) (1907).

AD LIBITUM (Lat., at pleasure), in music, a direction signifying that the performance of the passage in question is left to the unfettered discretion of the performer; also that a given portion of a composition, such as the accompaniment of a choral piece, may be omitted if desired.

ADMETUS, in Greek legend, son of Pheres, king of Pherae, in Thessaly. By the aid of Apollo, who served him as a slave—either as a punishment for having slain the Cyclops, or out of affection for his mortal master—he won the hand of Alcestis, the most beautiful of the daughters of Pelias, king of Iolcus. Finding that Admetus was soon to die, Apollo persuaded the Fates to prolong his life, provided any one could be found to die in his place. His parents refused, but Alcestis consented. She was rescued by Heracles, who wrestled with Death and made him give her back.

ADMINISTRATION, the performance or management of affairs, a term specifically used in law for the administration or disposal of the estate of a deceased person. (See **WILL OR TESTAMENT**.) It is also used generally for "government," and specifically for "the Government" or the executive ministry, and in such connections as the administration (administering or tendering) of the sacraments, justice, oaths, medicines, etc.

Letters of Administration.—Upon the death of a person intestate or leaving a will to which no executors are appointed, or when the executors appointed by the will cannot or will not act, the probate division of the High Court is obliged to appoint an administrator who performs the duties of an executor. This is done by the court granting letters of administration to the person entitled. Grants of administration may be either general or limited. A general grant is made where the deceased has died intestate. Formerly, on the death of the owner of realty and

personalty intestate, the realty vested in the deceased's heir and the personalty in the court of probate until administrators were appointed. Now, since the rights of heirs as such are abolished by the Administration of Estates Act 1925, all the property, real and personal, vests in the court. Moreover, formerly the right to be appointed administrator was more or less defined. Now by the same act the court is given an absolute discretion as to whom it shall appoint, subject to these limitations: that where there is no special reason to the contrary some person interested in the residuary estate should be appointed, and that where the estate passing on the deceased's death includes land settled otherwise than by his will the trustees of the settlement should be appointed (s. 10). Not more than four persons are to be appointed administrators (Judicature Act 1925, s. 160); and separate administrators may be appointed to the real and to the personal estate of the deceased (Administration of Estates Act 1925, s. 13). In the absence of statutory next-of-kin the Crown, on the death intestate of an owner of land and personalty, is now entitled to both as *bona vacantia*, escheat both to the intermediate lord and to the Crown being abolished. If a creditor claims and obtains a grant he is compelled by the court to enter into a bond with two sureties that he will not prefer his own debt to those of other creditors. The more important cases of grants of special letters of administration are the following:—

Administration *cum testamento annexo*, where the deceased has left a will but has appointed no executor to it, or the executor appointed has died or refuses to act. In this case the court will make the grant to the person (usually the residuary legatee) with the largest beneficial interest in the estate.

Administration *de bonis non administratis*: this occurs in two cases—(a) where the executor dies intestate after probate without having completely administered the estate; (b) where an administrator dies. In the first case the principle of administration *cum testamento* is followed, in the second that of general grants in the selection of the person to whom letters are granted.

Administration *durante minore aetate*, when the person nominated by the will as executor is under age.

Administration *durante absentia*, when the executor or administrator is out of the jurisdiction for more than a year.

Administration *pendente lite*, where there is a dispute as to the person entitled to probate or a general grant of letters the court appoints an administrator till the question has been decided.

ADMINISTRATOR: see **ADMINISTRATION**, **WILL OR TESTAMENT**.

ADMIRABLE CRICHTON: see **CRICHTON**, JAMES.

ADMIRAL, the rank and title of the naval officer who commands a fleet or sub-division of a fleet. In the British navy there are four grades of admiral; i.e., admiral of the fleet, admiral, vice-admiral and rear-admiral, in descending order of seniority. These titles superseded those in vogue in the Stuart navy of admiral of the red, white and blue. In the United States there are four corresponding grades: admiral of the navy, admiral, vice-admiral and rear-admiral. The first was created in 1899 for Admiral Dewey. The second and third, corresponding to general and lieutenant-general in the army, were created in 1866. Rear-admirals are divided into two classes, those of the first-rank, corresponding to major-generals in the army and those of the second class corresponding to brigadier-generals. In France the four grades are *Grand amiral*, *amiral*, *vice-amiral* and *contre-amiral*.

The rank of admiral essentially applies to flag officers of the military branch who have commanded, or who have qualified to command, a fleet or squadron at sea. In Great Britain the equivalent rank of admiral is granted to certain officers of the non-military branches of the royal navy; e.g., engineer rear-admiral, paymaster rear-admiral, but they are not flag officers and should not be addressed without the appropriate prefix.

The corresponding ranks in the British services are:

NAVY	ARMY	AIR FORCE
Admiral of the Fleet.	Field Marshal.	Marshal of the Royal Air Force.

NAVY—cont'd	ARMY—cont'd	AIR FORCE—cont'd
Admiral	General	Air Chief Marshal.
Vice-Admiral	Lieut.-General	Air Marshal.
Rear-Admiral	Major-General	Air Vice-Marshal.

It is exceptional for an admiral of the fleet to fly his flag at sea in peace time, but in the World War the commander-in-chief of the grand fleet held this rank. Commanders-in-chief of the main British fleet; *i.e.*, Mediterranean, and of the premier home ports—Portsmouth and Plymouth—are generally full admirals. The lesser independent commands and seconds-in-command are vice-admirals or rear-admirals. In the United States the chief commander of the Atlantic or Pacific fleets is more often a rear-admiral while the ranks of vice-admiral and admiral are reserved for occasions of rare honor.

The political and administrative head of the British navy up to the year 1546 was known as "The Lord High Admiral," which office is now executed by the lords commissioners of the Admiralty. There still remain the honorary titles of "Vice- and Rear-Admiral of Great Britain," in compliment on selected senior flag officers. The chiefs of bureaus in the United States Navy Department rank as rear-admirals during their term of office.

The origin of the title is undoubtedly Arabic, the derivation being *amir* or *emir*, which, in combination with other words, signified "men in authority."

For bibliography see NAVY AND NAVIES.

ADMIRALTY. The department of State which regulates, controls, and maintains the Navy on behalf of the British Government is the Admiralty. The term "Admiralty" is used (to quote the old official definition) to mean "The Lord High Admiral for the time being . . . and when there shall be no such Lord High Admiral in office, any two or more of the Commissioners for executing the office of Lord High Admiral of the United Kingdom." Actually, the system whereby responsibility centred in a Lord High Admiral of the United Kingdom was terminated in the reign of Henry VIII. and since then the office has been executed by a board, which, varying somewhat in its constituency, has been the forerunner of the Admiralty of to-day.

Before that time there was no recognized organization to supply the wants of the Navy, which were dealt with spasmodically as they arose. Then, with the increase in the strength of the Navy, it became more and more obvious that change was imperative. This brought about the formation of a board of principal officers, subordinate to the lord high admiral, whose duty it was to supply the needs of the fleet, and established the sound principle that political and executive control should be superior to, but separate from, administration. The new system also did much to relieve those responsible for the conduct of warlike operations from details of supplies, design, and so forth.

The political and executive authority passed at one time to the king and council and again to a parliamentary committee and yet again to a lord high admiral to the king, but finally it came to be vested in the Board of Admiralty, with whom it remained throughout the great maritime wars from the end of the 17th century to the downfall of Napoleon. This authority, in practice, was not exercised in full by the board of principal officers or the navy board, whose energies were mainly devoted to the administration of supplies. In principle, the several commissioners were, from early days, intended to keep in direct and constant communication with the first lord and with each other, and also with the civil departments working under their control. James I. enjoined that the principal officers and commissioners of the Navy should be in constant communication among themselves, consulting and advising "by common counsel and argument of most voices" and live as near together as could conveniently be arranged, and should meet at the Navy office at least twice a week.

Originally there existed an ordnance board instituted specially for the Navy, but this eventually passed into military hands—very much to the detriment of the Navy's ordnance requirements. It was for long a byword in inefficiency and sloth. There is now a joint board with naval, military, and air force representatives to deal with design but not with supplies, which are the concern of the several departments.

The Navy Board in its early form continued to function for nearly three centuries, but by 1832 the various departments had become so inefficient and unwieldy that reform again became essential. This was undertaken by Sir James Graham, who abolished the Navy office and brought all civil departments directly under the Admiralty board, organizing them under five principal officers; *viz.*: surveyor of the Navy, storekeeper-general, controller of victualling, medical director-general, and accountant-general. Each of these was under a superintending lord of the Admiralty who represented their various charges on the board. This system had the defect that all the lords of the Admiralty were responsible for, and therefore their attention was largely engaged in, questions of supply, and there was no body of senior officers who could devote their time specially to the conduct of war. The reforms were probably dictated in some measure by the fact that the period was one of peace and prospective peace and that the naval estimates had been reduced to the small amount of £4,500,000 per annum. Eventually the system was put to the test by the Crimean War; but it did not bear the strain well and by the end of the 'sixties it had broken down seriously. At this time the Navy was expanding considerably and the mechanical era was rapidly developing. The introduction of "ironclads," improvements to ordnance, the gradual ousting of sails by steam, all resulted in efforts centring very largely on material details. This and the growing numbers of personnel meant that the members of the board were largely taken up with their departmental duties and had little time to give to matters of policy, much less to war plans.

In 1868 H. C. Eardley Childers, on becoming first lord, endeavoured to rectify the shortcomings of the system, but it cannot be said that his reforms were very successful, since they resulted in the several lords being restricted more than ever to the business assigned to them, whereby board meetings became the exception rather than the rule and much passed into the unprofessional hands of the civil first lord. The disaster to the low freeboard masted turret-ship "Captain" brought matters to a head. Childers retired and was succeeded by Goschen in 1871.

The new first lord reverted to the principles of the original system, which made for more collective responsibility. We see the naval staff in embryo in a foreign intelligence committee, inaugurated in 1884. This was developed into the intelligence committee in 1887. It was largely due to the efforts of Lord Charles Beresford that these committees came about and from then onwards the more enlightened sections of the Navy never ceased to press for the formation of a proper war staff.

In 1886 Lord Charles resigned from his appointment as fourth sea lord on the ground that the organization provided for an intelligence department and, for the conduct of war, was inadequate. Various changes in the responsibilities of the First Sea Lord were made by an Order-in-Council of 1904, one of the principal of these being that the senior naval lord was given virtual supremacy over all his colleagues. He was also given considerable responsibility connected with material.

In 1911 Mr. Churchill, as first lord, established a naval war staff. In theory this step was admirable, but in practice the staff was not given the necessary standing or authority in the Admiralty machine. As a result, proper use was not made of its services during the earlier years of the World War, especially in analysing and preparing plans before embarking upon such enterprises as the Dardanelles campaign. The individual influence of the most forceful personality on the board still dominated naval policy to the exclusion of proper staff work and even, on occasion, to considered and well-informed judgment.

In May 1917 we see a new development, whereby the First Sea Lord was made chief of the naval staff, and two naval members were added to the board, with titles of "deputy chief of the naval staff" and "assistant chief of the naval staff." For a short time there was also a third addition, with the title of "deputy first sea lord"; but responsibility continued to rest on all the members of the board.

As the war developed, it became more and more evident that those naval lords who were chiefly engaged in matters of adminis-

tration and supply could not, at the same time, devote adequate attention to the control of the naval side of the war. In point of fact, the position was that they were held responsible in matters with which it was humanly impossible for them to take any very active part. In the autumn of that year the naval staff system was put upon a new and altogether sounder basis and it was separated, so far as was practicable, from administration. Under the presidency of the first lord two committees were formed—one (consisting of the four staff lords) to deal with operations, and the other (consisting of the remaining sea lords and the civil lords) to deal with maintenance. The operations committee dealt with such matters as the provision, equipment, efficiency, organization, and utilisation of the Navy as a fighting force; the maintenance committee devoted their efforts to personnel, material, supplies, works, and the maintenance of the fleet generally, in accordance with the requirements of the operations committee. Questions of great importance were still referred to the board as a whole.

Under this system the first sea lord, as chief of the naval staff, was responsible for movements of ships, the general conduct of naval warfare, the fighting and sea-going efficiency of the fleet, and other matters connected with its active employment. The second sea lord remained chief of naval personnel; the third sea lord, as controller, continued to deal with material matters such as ship construction, design of guns, mountings, torpedoes, and machinery; the fourth sea lord was chief of supplies and transport; the deputy chief of the naval staff was head of the operations, plans, intelligence, and trade divisions; the assistant chief of the naval staff was head of the gunnery, torpedo, training, and staff duties divisions, and the naval air and tactical sections. There continued to be a civil lord, a parliamentary and financial secretary, and the permanent secretary to the board, and, at the head, the minister of State, the first lord.

This organization remained substantially the same after the war and may be said to meet well the peace-time requirements of the Navy, while it provides the essential personnel for the higher conduct of any future war at sea.

BIBLIOGRAPHY.—*Admiralty Administration—Its Faults and Defects* (1861); Admiral Viscount Jellicoe of Scapa, *The Crisis of the Naval War* (1920); The Rt. Hon. Winston Churchill, *The World Crisis 1911-14* (1923).

FOR ADMIRALTY, U.S., see NAVY, U.S.

ADMIRALTY, HIGH COURT OF. The High Court of Admiralty of England was the court of the deputy or lieutenant of the admiral. It is supposed in the *Black Book of the Admiralty* to have been founded in the reign of Edward I.; but it would appear, from the learned discussion of R. G. Marsden, that it was established as a civil court by Edward III. in the year 1360; the power of the admiral to determine matters of discipline in the fleet, and possibly questions of piracy and prize, being somewhat earlier. At first there were separate admirals or rear-admirals of the north, south and west, each with deputies and courts. A list of them was collected by Sir H. Spelman. These were merged in or absorbed by one high court early in the 15th century. Sir Thomas Beaufort, afterwards earl of Dorset and duke of Exeter (appointed admiral of the fleet 1407, and admiral of England, Ireland and Aquitaine 1412, which latter office he held till his death in 1426), certainly had a court, with a marshal and other officers, and forms of legal process—mandates, warrants, citations, compulsories, proxies, etc. Complaints of encroachment of jurisdiction by the admiralty courts led to the restraining acts, 13 Ric. II. c. 5 (1389), 15 Ric. II. c. 3 (1391) and 2 Hen. IV. c. 11 (1400).

Jurisdiction.—The original object of the institution of the courts or court seems to have been to prevent or punish piracy and other crimes upon the narrow seas and to deal with questions of prize; but civil jurisdiction soon followed. The jurisdiction in criminal matters was transferred by the Offences at Sea Act, 1536, to the admiral or his deputy and three or four other substantial persons appointed by the lord chancellor, who were to proceed according to the course of the common law. By the Central Criminal Court Act, 1834, cognizance of crimes committed within the jurisdiction of the admiralty was given to the central criminal court. By an act of 1844 it has been also given to the justices of assize; and crimes done within the jurisdiction of the admiralty are now

tried as crimes committed within the body of a county. See also the Criminal Law Consolidation Acts of 1861.

From the time of Henry IV. the only legislation affecting the civil jurisdiction of the High Court of Admiralty till the time of Queen Victoria is to be found in an act of 1540, enabling the admiral or his lieutenant to decide on certain complaints of freighters against shipmasters for delay in sailing, and one of 1562, giving the lord high admiral of England, the lord warden of the Cinque Ports, their lieutenants and judges, co-ordinate power with other judges to enforce forfeitures under that act—a very curious and miscellaneous statute called "An Act for the Maintenance of the Navy."

In an act of 1534, with regard to ecclesiastical appeals from the courts of the archbishops to the Crown, it is provided that the appeal shall be to the king in Chancery, "and that upon every such appeal a commission shall be directed under the great seal to such persons as shall be named by the king's highness, his heirs or successors, like as in cases of appeal from the Admiralty Court." It is only in this incidental recognition that recorded authority for appeals from the admiralty to persons commissioned under the great seal is to be found. The appeal to these "persons," called delegates, continued until it was transferred first to the Privy Council and then to the judicial committee of the Privy Council by acts of 1832 and 1833.

The early jurisdiction of the court appears to have been exercised very much under the same procedure as that used by the courts of common law. Juries are mentioned, sometimes of the county and sometimes of the county and merchants. But the connection with foreign parts led to the gradual introduction of a procedure resembling that coming into use on the Continent and based on the Roman civil law.

Restraining Acts.—The material enactments of the restraining statutes were as follows:—An act of 1389 (13 Ric. II. c. 5) provided that "the admirals and their deputies shall not meddle from henceforth of anything done within the realm, but only of a thing done upon the sea, as it hath been used in the time of the noble prince king Edward, grandfather of our lord the king that now is." The Act of 1391 (15 Ric. II. c. 3) provided that "of all manner of contracts, pleas and quarrels, and other things rising within the bodies of the counties as well by land as by water, and also of wreck of the sea, the admiral's court shall have no manner of cognizance, power, nor jurisdiction; but all such manner of contracts, pleas and quarrels, and all other things rising within the bodies of counties, as well by land as by water, as afore, and also wreck of the sea, shall be tried, determined, discussed and remedied by the laws of the land, and not before nor by the admiral, nor his lieutenant in any wise. Nevertheless, of the death of a man, and of a mayhem done in great ships, being and hovering in the main stream of great rivers, only beneath the (bridges) of the same rivers (nigh) to the sea, and in none other places of the same rivers, the admiral shall have cognizance, and also to arrest ships in the great flotes for the great voyages of the king and of the realm; saving always to the king all manner of forfeitures and profits thereof coming; and he shall have also jurisdiction upon the said flotes, during the said voyage only; saving always to the lords, cities, and boroughs, their liberties and franchises." The statutes of Richard, except the enabling part of the second, were repealed by the Civil Procedure Acts Repeal Act, 1879. The formation of a High Court of Justice rendered them obsolete.

In the reign of James I. the chronic controversies between the courts of common law and the admiralty court as to the limits of their respective jurisdictions reached an acute stage. We find the records of it in the second volume of Marsden's *Select Pleas in the Court of Admiralty*, and in Lord Coke's writings: *Reports*, part xiii. 51; *Institutes*, part iv. chap. 22. In this latter passage Lord Coke records how, notwithstanding an agreement asserted to have been made in 1575 between the justices of the King's Bench and the judge of the admiralty, the judges of the common law courts successfully maintained their right to prohibit suits in admiralty upon contracts made on shore, or within havens, or creeks, or tidal rivers, if the waters were within the body of

any county, wheresoever such contracts were broken, for torts committed within the body of a county, whether on land or water, and for contracts made in parts beyond the seas. It is due to the memory of the judges of Lord Coke's time to say that, at any rate as regards contracts made *in partibus transmarinis*, the same rule appears to have been applied at least as early as 1544, the judges then holding that "for actions transitory abroad, action may lie at common law."

Judge's Patent.—All the while, however, the patents of the admiralty judge purported to confer on him a far ampler jurisdiction than the jealousy of the other courts would concede to him. The patent of the last judge of the court, Sir Robert Joseph Phillimore, dated Aug. 23, 1867, styles him "Lieut. Offl Princl and Commissary Genl and Special in our High Court of Admiralty of Eng. and President and Judge of the same," and gives to him power to take cognizance of "all causes, civil and maritime, also all contracts, complaints, offences or suspected offences, crimes, pleas, debts, exchanges, accounts, policies of assurance, loading of ships, and all other matters and contracts which relate to freight due for the use of ships, transportation, money or bottomry; also all suits civil and maritime between merchants or between proprietors of ships and other vessels for matters in, upon, or by the sea, or public streams, or fresh-water ports, rivers, nooks and places overflowed whatsoever within the ebbing and flowing of the sea, and high-water mark, or upon any of the shores or banks adjacent from any of the first bridges towards the sea through England and Ireland and the dominions thereof, or elsewhere beyond the seas." Power is also given to hear appeals from vice-admirals; also "to arrest . . . according to the civil laws and ancient customs of our high court . . . all ships, persons, things, goods, wares and merchandise"; also "to enquire by the oaths of honest and lawful men . . . of all . . . things which . . . ought to be enquired after, and to mulct, arrest, punish, chastise, and reform"; also "to preserve the public streams of our admiralty as well for the preservation of our royal navy, and of the fleets and vessels of our kingdom . . . as of whatsoever fishes increasing in the rivers"; also "to reform nets too straight and other unlawful engines and instruments whatsoever for the catching of fishes"; also to take cognizance "of the wreck of the sea . . . and of the death, drowning and view of dead bodies," and the conservation of the statutes concerning wreck of the sea and the office of coroner (1276), and concerning pillages (1353), and "the cognizance of mayhem" within the ebb and flow of the tide; all in as ample manner and form as they were enjoyed by Dr. David Lewis (judge from 1558 to 1584), Sir Julius Caesar, and the other judges in order (22 in all) before Sir Robert Phillimore. This form of patent differs in but few respects from the earlier Latin patents—*tempore* Henry VIII.—except that they have a clause *non obstantibus statutis*.

Modern Progress.—As has been said, however, the contention of the common law judges prevailed, and the admiralty court (except for a temporary revival under Cromwell) sank into comparative insignificance during the 17th century. The great maritime wars of the 18th century gave scope to the exercise of its prize jurisdiction; and its international importance as a prize court in the latter half of the 18th and the first part of the 19th centuries is a matter of common historical knowledge. There were upwards of 1,000 prize causes each year between 1803 and 1811, in some years upwards of 2,000.

There were other great judges; but Sir William Scott, afterwards Lord Stowell, is the most famous. Before his time there were no reports of admiralty cases, except Hay and Marriott's prize decisions. But from his time onwards there has been a continuous stream of admiralty reports, and we begin to find important cases decided on the instance as well as on the prize side.

In the reign of Queen Victoria, two enabling statutes, 1840 and 1861, were passed and greatly enlarged the jurisdiction of the court. The manner in which these statutes were administered by Dr. Stephen Lushington and Sir R. J. Phillimore, whose tenure of office covered the whole period of the queen's reign till the creation of the High Court of Justice, the valuable assistance rendered by the nautical assessors from the Trinity House, the

great increase of shipping, especially of steam shipping, and the number and gravity of cases of collision, salvage and damage to cargo, restored the activity of the court and made it one of the most important tribunals of the country. In 1875, by the operation of the Judicature Acts of 1873 and 1875, the High Court of Admiralty was with the other great courts of England formed into the High Court of Justice. The principal officers of the court in subordination to the judge were the registrar (an office which always points to a connection with canon or civil law), and the marshal, who acted as the maritime sheriff, having for his baton of office a silver oar. The assistance of the Trinity Masters, which has been already mentioned, was provided for in the charter of incorporation of the Trinity House. These officers and their assistance have been preserved in the High Court of Justice.

Practitioners in the Court.—Till the year 1859 the practitioners in the High Court of Admiralty were the same as those in the ecclesiastical courts and distinct from those who practised in the ordinary courts. Advocates took the place of barristers, and proctors of solicitors. The place of the attorney-general was taken by the king's or queen's advocate-general, and that of the treasury solicitor by the king's or queen's procurator or proctor. There were also an admiralty advocate and an admiralty proctor.

In an act of 1859 the practice was thrown open to barristers and to attorneys and solicitors.

Upon the next vacancy after the courts were thrown open, the Crown altered the precedence and placed the queen's advocate after the attorney- and solicitor-general. There were two holders of the office under these conditions, Sir R. J. Phillimore and Sir Travers Twiss. The office was not filled up after the resignation of the latter, nor was the office of admiralty advocate filled up when next it became vacant.

Ireland.—The High Court of Admiralty of Ireland, being formed on the same pattern as the High Court in England, sat in the Four Courts, Dublin, having a judge, a registrar, a marshal and a king's or queen's advocate. In peace time and war time alike it exercised only an instance jurisdiction, though in 1793 it claimed to exercise prize jurisdiction (*see* ADMIRALTY JURISDICTION). No prize commission ever issued to it. By the Irish Judicature Act of 1877 it was directed that it should be amalgamated with the Irish High Court of Justice upon the next vacancy in the office of judge, and this subsequently took place. There was no separate lord high admiral for Ireland.

Scotland.—At the Union, while the national functions of the lord high admiral were merged in the English office it was provided by the Act of Union that the Court of Admiralty in Scotland should be continued "for determination of all maritime cases relating to private rights in Scotland competent to the jurisdiction of the Admiralty Court." This court continued till 1831, when its civil jurisdiction was given to the Court of Session and the Sheriffs' Courts (*see* ADMIRALTY JURISDICTION).

See J. Godolphin, *View of the Admiral Jurisdiction* (1661); Sir Travers Twiss, *Black Book of the Admiralty*, Rolls' series (1871); R. G. Marsden, *Select Pleas in the Court of Admiralty*, published by the Selden Society (1894). (P.)

ADMIRALTY ISLANDS, about 40 islands of the Bismarck archipelago, north of New Guinea, between 1° and 3° S. and 146° and 148° E. Area 600 sq. miles. Manus, the largest island, has a length of 60 miles; it is sometimes termed Great Admiralty island, its chief town being Lorengai. There are cultivations of coco-nuts for copra and valuable pearl and shell fisheries. Manus has hills of 3,000ft., but the other islands are low, small and mostly of coral formation. They were discovered by the Dutch in 1616, and Philip Carteret visited them in 1767, but the first landing seems to have been from the "Challenger," in 1875. They were part of a German protectorate from 1885-1914. In Nov. 1914 they were occupied by Australian troops, and in 1919, under the Treaty of Versailles, they were made part of the Mandated Territory of New Guinea, under the Commonwealth of Australia. Estimated pop. 13,750. The natives are Papuan, with some mixture of blood, and are cannibals, not well-disposed to strangers, but they are becoming more tractable under European supervision. The language is Papuan in

type and displays many dialectical variations, every district having its own particular patois (*see* PAPUAN LANGUAGE).

ADMIRALTY JURISDICTION. The courts by which, as far as we know, admiralty jurisdiction in civil matters was first exercised were the following. In and throughout England the courts of the several admirals soon combined into one High Court of Admiralty (*see* ADMIRALTY, HIGH COURT OF). Within the territories of the Cinque Ports the Court of Admiralty of the Cinque Ports exercised a co-ordinate jurisdiction. In certain towns and places there were local courts of vice-admiralty. In Scotland there existed the Scottish High Court of Admiralty, in Ireland the Irish High Court of Admiralty. Of these courts that of the Cinque Ports alone remains untouched. The Scottish Court was abolished, and its civil jurisdiction given to the Court of Session and to the courts of the sheriffs by the Court of Session Act, 1830—not, however, till a decision given by it and the appeal therefrom to the House of Lords had established a remarkable rule of admiralty law in cases of collision (*Hay v. le Neve*, 1824, 2 Shaw, Sc. App. Cas. 395). The act states that the Court of Justiciary held cumulative jurisdiction with the Court of Admiralty in criminal matters. The local vice-admiralty courts in England had ceased to do much work when they were abolished by the Municipal Corporations Act, 1835. The High Court became, with the other superior courts, a component part of the High Court of Justice by virtue of the Judicature Acts, 1873 and 1875. And the Irish Court in like manner became a part of the High Court of Justice in Ireland by virtue of the Judicature Act passed in 1877.

Vice-Admiralty Courts.—As England first, and Great Britain afterwards, acquired colonies and possessions beyond seas, vice-admiralty courts were established. The earliest known was that in Jamaica, established in the year 1662. Some vice-admiralty courts created for prize purposes in the eighteenth century were suffered to expire after 1815. In the year 1863, when the act regulating the vice-admiralty courts was passed, there were vice-admiralty courts established in 45 several portions of the King's dominions; to which by an act of 1867 one for the Straits Settlements was added. These courts have been regulated from time to time by the following statutes: 2 and 3 Will. IV. c. 51, 26 and 27 Vict. c. 24 (Vice-Admiralty Courts Act, 1863), already cited, and 30 and 31 Vict. c. 45 (Vice-Admiralty Courts Act Amendment Act, 1867); and by the slave trade acts, of which the last and consolidating act was that of 1873.

In 1890 the Colonial Courts of Admiralty Act provided that, except in the colonies of New South Wales, Victoria, St. Helena and British Honduras, vice-admiralty courts should be abolished and colonial courts of admiralty substituted. There is power, however, reserved to the Crown to erect through the admiralty in any British possession any vice-admiralty court, except in India or any British possession having a representative legislature. No vice-admiralty court so established can exercise any jurisdiction except for some purpose relating to prize, the royal navy, the slave trade, foreign enlistment, Pacific Islanders' protection, and questions relating to treaties or conventions on international law.

Colonial Courts of Admiralty.—By the Colonial Courts of Admiralty Act, 1890, already referred to, every court of law in a British possession which is declared by its legislature to be such, or if there be no such declaration, which has original unlimited civil jurisdiction, shall be a court of admiralty.

There used to be vice-admiralty courts for Calcutta, Madras and Bombay; but by the India High Courts Act, 1861, s. 9, the admiralty jurisdiction was given to the High Courts of these places.

Consular Courts.—Admiralty jurisdiction was given to the consular courts in China, Japan and Turkey (those in Japan and Turkey have disappeared with the capitulations), and by s. 12 of the Colonial Admiralty Courts Act any court established by H.M. for the exercise of jurisdiction in any place outside H.M.'s dominion may have admiralty jurisdiction granted to it.

Australia.—By the Commonwealth of Australia Constitution Act, 1900, a federal supreme court, to be called the High Court of Australia, is created, and the parliament of the Commonwealth may make laws conferring original jurisdiction on the High Court in matters of admiralty and maritime jurisdiction.

Isle of Man.—There is a court of admiralty in the Isle of Man of which the water-bailiff is judge. He is also styled admiral. It is said to have jurisdiction in salvage and over other maritime matters occurring within three leagues from the shore.

County and Local Courts.—Modern statutes have given admiralty jurisdiction to the City of London Court, Court of Passage and to county courts in the following matters: Salvage, where the value of the salvaged property does not exceed £1,000, or the claim for reward £300; towage, necessities and wages, where the claim does not exceed £150; claims for damage to cargo, or by collision, up to £300 (and for sums above these prescribed limits by agreement between the parties); and claims arising out of breaches of charter parties and other contracts for carriage of goods in foreign ships, or torts in respect thereof, up to £300. This jurisdiction is restricted to subjects over which jurisdiction was possessed by the High Court of Admiralty at the time when the first of these acts was passed, except as regards the last branch of it (the *Aline*, 1880, 5 Ex. Div. 227; *R. v. Judge of City of London Court* [1892] 1 Q.B. 272). In analogy with the county court admiralty jurisdiction created in England, a limited admiralty jurisdiction was given in Ireland to the recorders of certain boroughs and the chairmen of certain quarter sessions; in salvage cases, where a county court in England would have jurisdiction, magistrates, recorders and chairmen of quarter sessions may have jurisdiction as official arbitrators (Merchant Shipping Act, 1894, s. 547). In Scotland, admiralty suits in cases not exceeding the value of £25 are exclusively tried in the sheriff's court; while over that limit the sheriff's court and the court of session have concurrent jurisdiction. The sheriff has also criminal admiralty jurisdiction, but only as to crimes which he would be competent to try if committed on land (The Court of Session Act, 1830, ss. 21 and 22).

By an act of 1821 an arbitral jurisdiction in cases of salvage was given to certain commissioners of the Cinque Ports.

The appeal from county courts and commissioners is to the High Court of Justice, and is exercised by a divisional court of the Probate, Divorce and Admiralty Division. In cases arising within the Cinque Ports there is an optional appeal to the Admiralty Court of the Cinque Ports. The appeal from the High Court of Justice is in ordinary admiralty matters, as in others, to the Court of Appeal, and from thence to the House of Lords.

Civil Jurisdiction.—In the high courts, whether in England, Scotland or Ireland, it is not now necessary to distinguish their civil admiralty jurisdiction, from their ordinary civil jurisdiction, except for the purpose of seeing whether there can or cannot be process *in rem*. Not that every admiralty action can of right be brought *in rem*, but that no process *in rem* lies at the suit of a subject unless it be for a matter of admiralty jurisdiction—one, for instance, that could in England have been tried in the High Court of Admiralty. Now these matters of admiralty jurisdiction with process *in rem* range themselves under four primary and four supplementary heads. The four primary are damage, salvage, bottomry, wages; and the four supplementary are extensions due to one or other of the statutes of 1840 (Admiralty Court) and 1861 (Admiralty Court Act). They are damage to cargo carried in a ship, necessities supplied to a ship, mortgage of ship, and master's claim for wages and disbursements on account of a ship. In all these cases, primary and secondary, the process of which a plaintiff can avail himself for redress, may be either *in personam* as in other civil suits, or by arrest of the ship, and, in cases of salvage and bottomry, the cargo. Whenever, also, the ship can be arrested, any freight due can also be attached, by arrest of the cargo to the extent only of the freight which it has to pay. For the purpose of ascertaining whether or not process *in rem* would lie, there have been distinctions as nice, and the line of admiralty jurisdiction has been drawn as carefully, as in the cases of the admiralty jurisdiction of the county courts (the

Theta, [1894] P. 280; the *Gas Float Whitton* [1897] App. Cas. 337). Similar questions have been raised in the United States, from *De Lovio v. Boit* (1815, 2 Gall. 398), and *Ramsay v. Allegre* (1827, 12 Wheat. 611), down to the more modern cases which will be found quoted in the arguments and judgments in the *Gas Float Whitton*.

The disciplinary jurisdiction at one time exercised by the Admiralty Court, over both the royal navy and merchant vessels, may be said to be obsolete in time of peace, the last remnant of it being suits against merchantmen for flying flags appropriate to men-of-war (the *Minerva*, 1800 3, C. Rob. 34), a matter now more effectively provided against by the Merchant Shipping Act, 1894. In time of war, however, it was exercised in some instances as long as the Admiralty Court lasted, and is now in consequence exercisable by the High Court of Justice (see PRIZE). It was, perhaps, in consequence of its ancient disciplinary jurisdiction that the Admiralty Court was made the court to enforce certain portions of the Foreign Enlistment Act, 1870.

Finally, appeals from decisions of courts of inquiry, under the Merchant Shipping Act, cancelling or suspending the certificates of officers in the merchant service, may be made to the Probate, Divorce and Admiralty Division of the High Court of Justice.

Criminal Cases.—The Admiralty jurisdiction in criminal matters extends over all crimes committed on board British ships at sea or in tidal waters, even though such tidal waters be well within foreign territory (*R. v. Anderson*, 1868, L.R. 1 C.C.R. 161), but not over crimes committed on board foreign vessels upon the high seas (*R. v. Serva*, 1845, 1 Denison C.C. 104). Whether it extended over crimes committed on foreign ships within territorial waters of the United Kingdom, and whether a zone of three miles round the shores of the United Kingdom was for such purpose territorial water, were the great questions raised in *R. v. Keyn* (the *Franconia*, L.R. 2 Ex. Div. 126), and decided in the negative by the majority of the judges. Since then, however, the legislature has brought these waters within the jurisdiction of the admiralty by the Territorial Waters Jurisdiction Act, 1878. Section 2 runs as follows: "An offence committed by a person, whether he is or is not a British subject, on the open sea within the territorial waters of British dominions, is an offence within the jurisdiction of the admiral, although it may have been committed on board or by means of a foreign ship." By s. 7 the "jurisdiction of the admiral" is defined as "including the jurisdiction of the admiralty of England or Ireland, or either of such jurisdictions as used in any act of parliament" (see TERRITORIAL WATERS). But where portions of the sea and tidal waters, by reason of their partially land-locked positions, are deemed to be in the body of a county, there is no admiralty jurisdiction. Crimes are tried as if they were committed on land within the same county.

Pirates, whatever flag they pretended to fly, were, from 1360 onwards, wherever their crimes were committed, subject to the admiralty jurisdiction. The criminal jurisdiction of the admiralty was first exercised by the High Court of Admiralty; and then, by virtue of the Offences at Sea Act, 1536, transferred to commissioners appointed under the great seal, among whom were to be the admiral or admirals, his or their deputies. Admiralty sessions were held for this purpose till 1834. Admiralty criminal jurisdiction is now, by virtue of the series of statutes, the Offences at Sea Act, 1799, the Central Criminal Court Act, 1834, Offences at Sea Act, 1844, and the criminal law consolidation acts passed in 1861, exercised by the Central Criminal Court and by the ordinary courts of assize. Special provision for trial in the colonies of offences committed at sea has been made by an act of William III. (1698-99), the Offences at Sea Act, 1806, and the Admiralty Offences (Colonial) Act, 1849.

See Clunet, *Journal du droit international privé*, cited shortly as Clunet; De Pistoye et Duverdy, *Traité des prises maritimes* (1855) vol. ii., tit. viii.; Phillimore, *International Law*, vol. i., vol. iii., part xi.; v. Holzendorff, *Rechtslexicon* (Leipzig, 1881); Raikes, *The Maritime Codes of Spain and Portugal* (1896), of *Holland and Belgium* (1898), of *Italy* (1900); Autran, *Code international de l'abordage, de l'assistance, et du sauvetage maritimes* (1902). (P.)

United States.—Admiralty jurisdiction was exercised in the colonies by vice-admiralty courts until 1776, then by the State

admiralty courts until 1789. The Constitution, Art. III., s. 2, provides that the judicial power of the United States "shall extend to all cases of admiralty and maritime jurisdiction."

The Judiciary Act of 1789 (1 U.S.S.L. 76) granted original jurisdiction to United States district courts. The circuit courts were given concurrent original jurisdiction over seizures for slave trading, condemnations of property used by persons in insurrection (R.S. 629, 2nd ed.), and in the coolie trade (R.S. 2159, 2nd ed.). The supreme court of the District of Columbia was given the same jurisdiction as that of the United States district courts in 1901 (31 U.S.S.L. 1199). Formerly the Judiciary Act authorized appeals from the district court to the circuit court and thence to the Supreme Court. This practice was abolished in 1891, and nine circuit courts of appeals were created (Judicial Code, s. 116). These were the final courts of appeal in admiralty, except that there was the right of a direct appeal to the Supreme Court on questions of jurisdiction (Judicial Code, s. 238), and that the Supreme Court might in its discretion review the judgments of the circuit court of appeals by writs of certiorari (Judicial Code, s. 240).

The circuit courts were abolished in 1911 (Judicial Code, s. 289). Direct appeals to the Supreme Court were abolished in 1925 (43 U.S.S.L. 938). Since then the district courts alone have original jurisdiction in all admiralty cases. Appeals lie to the circuit courts of appeal which may certify questions to the Supreme Court for opinion, and the Supreme Court may review the judgments of the circuit courts of appeal on writs of certiorari.

The district courts have jurisdiction in admiralty of suits against the United States in contract and in tort arising out of the operation of merchant vessels (41 U.S.S.L. 525), in tort, towage and salvage arising out of the operation of public vessels (43 U.S.S.L. 1112), and in certain cases concurrent jurisdiction with the court of claims in contract cases (24 U.S.S.L. 505; *Cornell S. S. Co. v. U.S.*, 202 U.S. 184). The district courts have jurisdiction over crimes and offences committed upon vessels of the United States wherever they may be afloat upon navigable waters, but they are tried according to common law criminal procedure (*U.S. v. Rodgers*, 150 U.S. 249; *Hamilton v. U.S.*, 268 Fed. 15).

Actions in admiralty may be either *in rem* with the arrest of the ship, or other maritime property, to enforce a maritime lien (a *ius in re*) or *in personam* against a person. Actions *in rem* are limited to courts of admiralty. Under s. 24 of the Judicial Code, "saving to suitors the right of a common law remedy where the common law is competent to give it," a right *in personam* may be enforced in a common law court, but the substantive rights of the parties are determined by the maritime law (*Southern Pacific v. Jensen*, 244 U.S. 205; *Knickerbocker Ice Co. v. Stewart*, 253 U.S. 149). Admiralty jurisdiction extends to all navigable waters, including rivers, lakes and canals connected with the sea (*The Hine*, 4 Wall. 555; *Robert W. Parson*, 191 U.S. 17). Admiralty jurisdiction extends to prize cases (*Jecker v. Montgomery*, 13 How. 498), to possessory and petitory suits (*The Schooner Tilton*, Fed. Cas. No. 14054; *Ward v. Peck*, 18 How. 267), to maritime contracts and torts. Maritime contracts are determined by their subject matter and in general they relate to ships as such, or to transportation of goods or passengers. They include charter-parties, contracts of affreightment, bills of lading, bottomry and respondentia bonds, salvage, towage, pilotage, stevedoring, supplies and repairs, advances, marine insurance policies, wages, preferred mortgages (41 U.S.S.L. 988, 1000; *ex parte Easton*, 95 U.S. 68). A contract to build a ship or furnish material for its completion is non-maritime (*Peoples Ferry Co. v. Beers*, 20 How. 393; *the Thames Co. v. Francis McDonald*, 254 U.S. 242). A tort is maritime if the injury is inflicted on navigable waters (*Atlantic Transport Co. v. Imbrovek*, 234 U.S. 52). If a vessel collides with a pier the damage to the pier is a non-maritime tort because the injury occurs on land (*Cleveland Terminal & Valley R.R. Co. v. Cleveland S.S. Co.*, 208 U.S. 316), but the damage to the vessel is a maritime tort because that injury occurs on navigable waters (*P.W. & B.R.R. Co. v. Phila. etc. S.S. Co.*, 23 How. 209; *Hill v. Board of Freeholders*, 45 Fed. 260). (A. M. B.)

ADMITTANCE, in alternating current electricity, the reciprocal of the reactance. (See ELECTRICITY.)

ADO (died 874), archbishop of Vienne in Lotharingia, held his archiepiscopal see from 859 till his death Dec. 16, 874. His extant letters reveal their writer as an energetic man of wide sympathies. Ado's principal works are a *Martyrologium* (printed *inter al.* in Migne, *Patrolog. lat.* cxxiii. pp. 181-420; append. pp. 419-436), and chronicle, *Chronicon sive Breviarium chronicorum de sex mundi aetatibus de Adamo usque ad ann. 869* (in Migne, cxxiii. pp. 20-138, and Pertz, *Monumenta Germ. ii.* pp. 315-323).

Ado's chronicle is based on that of Bede, with which he combines extracts from the ordinary sources, forming the whole into a consecutive narrative founded on the conception of the unity of the Roman Empire, which he traces in the succession of the emperors, Charlemagne and his heirs following immediately after Constantine and Irene.

BIBLIOGRAPHY.—Ado wrote also a book on the miracles (*Miracula*) of St. Bernard, archbishop of Vienne (9th century), published in the Bollandist *Acta Sanctorum*; a life or *Martyrium* of St. Desiderius, bishop of Vienne (died 608), written about 870 and published in Migne, cxxiii. pp. 435-442; and a life of St. Theudericus, abbot of Vienne (563), published in Mabillon, *Acta Sanct.*, i. pp. 678-681, Migne, cxxiii. pp. 443-450, and revised in Bollandist *Acta Sanct.*, Oct. 29, xii. pp. 840-843. See W. Wattenbach, *Deutschlands Geschichtsquellen*, vol. i. (Stuttgart, 1904).

ADOBE (ă-dō'bē), a Spanish-American word (often corrupted to *dobie*) for the sun-dried clay used for building by the Indians in the arid regions of the south-western United States and northern Mexico (from Spanish *adobar*, to plaster). The use of such building material is said to have been anciently introduced into Spain from northern Africa. Soon after the discovery of America the method was imported into Peru, Mexico and other dry countries of the New World by the Spanish conquerors, who brought it as early as the 16th century to the Indians of New Mexico and Arizona. Most of the buildings connected with the Spanish missions in California, established in 1770-1823 were constructed of adobe. In Mexico and the south-western United States the name is not only applied to the bricks but also to the clay from which they are made, and, likewise, to structures built of this material. The usual method of making adobe is very simple. It consists of wetting a quantity of suitable clay, adding a small amount of chopped straw, hay, grass roots or other fibrous litter, mixing the materials with a hoe or a similar implement, and then trampling the mass with the bare feet. When brought to the proper consistency, the adobe is shaped with simple wooden moulds into bricks. These vary greatly in size, in accordance with intended use, ranging from small forms about 8in. square and 2in. thick to large slabs 1 or 2yd. long, 1ft. wide and 6 to 8in. thick. A common form for structural use is about 12in. wide, 16in. long and from 4 to 8in. thick. After being properly dried, adobes are laid in walls, like ordinary bricks, and joined with a mortar of the same material. Often the walls are smoothly finished inside and out with this mortar and given an outer coating of lime wash, which is frequently tinted with yellow or other colours.

In regions of scant rainfall adobe is serviceable in structures of one storey or other low buildings, having well-drained foundations and non-leaking roofs with wide cornices and eaves. When protected against the action of water adobe walls will endure for many decades and sometimes for centuries. As adobe is a very poor conductor of heat and as walls made of it do not become frosty in cold weather or damp in a short rainy season, adobe structures are warm in winter and cool in summer, the interior temperature of the walls remaining remarkably constant. Since 1900 there has been a revival of adobe construction in the south-

western United States, particularly in California. In a modified form adobe is utilized also in Colorado and other States of the Rocky Mountain plateau, where, instead of being first made into bricks, the adobe is moulded directly into the wall, being applied and dried in successive layers. In the plateau region adobe is used chiefly for walls of stables, cattle sheds and chicken houses. In southern California substantial city homes have been constructed with adobe walls, made from materials available on the premises, and finished with waterproof plaster or stucco, thus making it possible, when so desired, to dispense with the wide cornices and eaves otherwise required in adobe structures. For the artistic adaptation of adobe to building construction see ARCHITECTURE.

Recent scientific researches have shown that seeds that have been embedded with the barnyard refuse used in making adobe are preserved indefinitely. Consequently, by dissolving out seeds contained in adobes from the walls of old buildings whose date of erection is known, the approximate date of introduction of various cultivated plants in the region may be ascertained.

See J. W. Adams, "Adobe as a Building Material for the Plains," *Colorado Agric. Expt. Sta. Bull.* 174 (1910); Lee McCrae, "The Revival of the Adobe," *Keith's Magazine*, vol. xlv., p. 45-47 (1921); Torrey Connor, "The Art and Uses of Adobe," *House Beautiful*, vol. li., p. 78-79 (1922); and Roy M. Singer, "Adobe House Construction," *National Builder*, vol. lxvii., pp. 74-76 (1924).

ADOBE SOIL, a term used in the western United States, particularly in California, to designate the structural quality of various clay soils, referring usually to the characteristic breakage of such soil material into small angular blocks when it dries. These soils are very heavy in texture, being composed of extremely fine-grained material, a large part of which is colloidal. Sands and loose sandy loams, for example, never display an adobe soil structure. By many, however, adobe soils are often thought of as constituting the material from which adobe or sun-dried bricks are made; but, as in the case of ordinary brick, adobe building materials are derived from a great variety of clayey soils. Under proper conditions of moisture soils of adobe structure are readily worked, but when too dry their hardness and coherence make tillage extremely difficult. When placed under irrigation soils of this type usually display great fertility.

ADOLESCENCE, the term now commonly adopted for the period between childhood and maturity, during which the characteristics (mental, physical and moral) that are to make or mar the individual disclose themselves, and then mature, in some cases by leaps and bounds, in others by more gradual evolution. The annual rate of growth, in height, weight and strength, increases to a marked extent and may even be doubled. The development in the man takes place in the direction of a greater strength, in the woman towards a fitter form for maternity. The sex sense develops, the love of nature and religion, and an overmastering curiosity both individual and general. This period of life, so fraught with its power for good and ill, is accordingly the most important and by far the most difficult for parents and educationists to deal with efficiently. The chief points for attention may be briefly indicated. Health depends mainly on two factors, heredity and environment. In an ideal system of training these two factors will be so fitted in and adapted to one another, that what is weak or unprovided for in the first will be amply compensated for in the second.

In an ideal condition children should be brought up in the country as much as possible. An abundance of simple well-cooked food in sufficient variety, ample time at table, where an atmosphere of light gaiety should be cultivated, and a period free from restraint both before and after meals, should be considered fundamental essentials.

The exercise of the body must be attended to in the shape of games.

But severe exercise should only be allowed under adequate medical control, and should be increased very gradually. In the case of girls, let them run, leap and climb with their brothers for the first 12 years or so of life. But as puberty approaches, with all the change, stress and strain dependent thereon, their lives may need appropriate modification. Rest may be necessary during the

MEXICAN PEONS MOULDING AND DRYING ADOBE, A COMMON BUILDING MATERIAL IN ARID PARTS OF MEXICO AND THE SOUTHWEST

menstrual periods of these earlier years, and perhaps, milder, more graduated exercise should be taken at other times. In the same way all mental strain should be diminished. Instead of pressure being put on a girl's intellectual education at about this time, as is too often the case, the time devoted to school and books should be diminished. Education should be on broader, more fundamental lines, and much time should be passed in the open air. With regard to the mental training of both sexes two points must be borne in mind. First, that an ample number of hours should be set on one side for sleep, up to ten years of age not less than 11, and up to 20 years not less than nine. Secondly, that the time devoted to "bookwork" should be broken up into a number of short periods, very carefully graduated to the individual child.

In every case where there is a family tendency towards any certain disease or weakness, that tendency must determine the whole circumstances of the child's life. That diathesis which is most serious and usually least regarded, the nervous excitable one, is by far the most important and the most difficult to deal with. Every effort should be made to avoid the conditions in which the hereditary predisposition would be aroused into mischievous action, and to encourage development on simple unexciting lines. The child should be confined to the schoolroom but little, and receive most of his training in wood and field. Other diatheses (the tuberculous, rheumatic, etc.) must be dealt with in appropriate ways.

The adolescent is prone to special weaknesses and moral perversions. The emotions are unstable, and any stress put on them may lead to undesirable results. Warm climates, tight-fitting clothes, corsets, rich foods, soft mattresses or indulgences of any kind, and also mental over-stimulation, are especially to be guarded against. The day should be filled with interests of an objective (in contradistinction to subjective) kind, and the child should retire to bed at night healthily fatigued in mind and body. Let there be confidence between mother and daughter, father and son, and, as the years bring the bodily changes, those in whom the children trust can choose the fitting moments for explaining their meaning and effect, and warning against abuses of the natural functions. (For bibliography see CHILDREN.)

ADOLPH OF NASSAU (c. 1255–1298), German king, son of Walram, count of Nassau. On May 5, 1292 he was chosen German king, in succession to Rudolph I., an election due rather to the political conditions of the time than to his personal qualities. His position was unstable, and the allegiance of many of the princes, among them Albert I., duke of Austria, son of the late King Rudolph, was merely nominal. He claimed Meissen as a vacant fief of the empire, and in 1294 allied himself with Edward I., King of England, against France. Edward granted him a subsidy, but Adolph turned his arms against Thuringia, which he had purchased from the landgrave Albert II. This bargain was resisted by the sons of Albert, and from 1294 to 1296 Adolph was campaigning in Meissen and Thuringia. Meissen was conquered, but he was not equally successful in Thuringia. He had been unable to fulfil the promises made at his election, and the princes began to look with suspicion upon his designs. Wenceslaus II., king of Bohemia, fell away from his allegiance, and Adolph was deposed at Mainz, on May 23, 1298, when Albert of Austria was elected his successor. At the battle of Goellheim on July 2, 1298 Adolph was killed, it is said by the hand of Albert.

Ennen, *Die Wahl des Königs Adolf von Nassau* (Cologne, 1866); L. Schmid, *Die Wahl des Grafen Adolf von Nassau zum Römischen König*; B. Gebhardt, *Handbuch der deutschen Geschichte*, Band i. (Berlin, 1901).

ADOLPHUS FREDERICK (1710–1771), king of Sweden, was born at Gottorp on May 14, 1710, the son of Christian Augustus (1673–1726), duke of Schleswig-Holstein-Gottorp and Albertina Frederica of Baden-Durlach. From 1727 to 1750 he was bishop of Lübeck, and administrator of Holstein-Kiel during the minority of Duke Charles Peter Ulrich, afterwards Peter III. of Russia. In 1743 he was elected heir to the throne of Sweden by the "Hat" faction in order that they might obtain better conditions of peace from the Empress Elizabeth, whose fondness

for the house of Holstein was notorious. During his whole reign (1751–71) Adolphus Frederick was little more than a figurehead, the real power being lodged in the hands of an omnipotent *riksdag*, distracted by fierce party strife. Twice he endeavoured to free himself from the intolerable tutelage of the estates. The first occasion was in 1756 when, stimulated by his wife, Louisa Ulrica, sister of Frederick the Great, he tried to regain part of his prerogative, and nearly lost his throne in consequence. On the second occasion (1768), under the guidance of his eldest son, afterwards Gustavus III., he succeeded in overthrowing the tyrannous "Cap" senate, but was unable to make any use of his victory. He died at Stockholm on Feb. 12, 1771.

See R. Nisbet Bain, *Gustavus III. and his Contemporaries*, vol. i. (London, 1895).

ADOLPHUS, JOHN LEYCESTER (1795–1862), English lawyer and author, well-known London barrister. Adolphus wrote *Letters to Richard Heber, Esq.* (1821) in which he discussed the authorship of the then anonymous Waverley novels, and fixed it upon Sir Walter Scott. This conclusion was based on the resemblance of the novels in general style and method to the poems acknowledged by Scott. Scott thought at first that the letters were written by Reginald Heber, afterwards bishop of Calcutta, and the discovery of J. L. Adolphus's identity led to a warm friendship. At the time of his death (Dec. 24, 1862) he was completing the *History of England to 1783*, written by his father John Adolphus (1768–1845). This book is still valuable for the history of the first part of the reign of George III.

ADONI, a town of British India, in the Bellary district of Madras, 307m. from Madras by rail. Pop. (1921) 30,232. It has manufactures of carpets, silk and cotton goods, factories for ginning and pressing cotton and a considerable trade in cotton. The hill-fort above, now in ruins, was a seat of government frequently mentioned in 18th century wars.

ADONIJAH. A name borne by several persons in the Old Testament, of whom the best known is the fourth son of David. Shortly before the death of David, he made preparations to seize the throne, to which he was the natural heir after the death of Absalom, and received the support of Joab and Abiathar the priest. However, Bathsheba, David's favourite wife, organized a counter-intrigue in favour of her son, Solomon. Shortly after his accession Solomon had Adonijah put to death on the ground that by seeking to marry David's concubine, Abishag, he was aiming at the crown (I. Kings i. seq.).

ADONIS, in classical mythology, a youth of remarkable beauty, the favourite of Aphrodite. According to one account, he was the son of the Syrian king, Theias, by his daughter Smyrna (Myrrha), who had been inspired by Aphrodite with unnatural love. When Theias discovered the truth he would have slain his daughter, but the gods in pity changed her into a tree of the same name. After ten months the tree burst asunder, and from it came forth Adonis. Aphrodite, charmed by his beauty, hid the infant in a box and handed him over to the care of Persephone, who afterwards refused to give him up. When an appeal was made to Zeus, he decided that Adonis should spend a third of the year with Persephone and a third with Aphrodite, the remaining third being at his own disposal. In another version (see Ovid, *Metam.*, x. 298) he was killed by a boar, and this version was followed by Shakespeare. Apollodorus (iii. 185) clumsily combines the two; numerous other variants exist. The name is generally supposed to be of Phoenician origin (from *adon*, "lord"), Adonis himself being identified with Tammuz, although this is not certain. (See also ARTIS.)

Annual festivals, called Adonia, were held in his honour at Byblus, and also, from the 5th century B.C. onwards, at different places in Greece. The central feature was the mourning for Adonis, generally represented by an effigy, which was afterwards flung into the water. The very elaborate Alexandrian festival is described by Theocritus (*Idyll* xv.).

It is now generally agreed that Adonis is a vegetation spirit, whose death and return to life represent the decay of nature in winter and its revival in spring. A special feature of the Athenian festival was the "Adonis gardens," small pots of seeds forced

to grow artificially, which rapidly faded. The dispute between Aphrodite and Persephone for the possession of Adonis finds a parallel in the story of Tammuz and Ishtar (see APHRODITE). In other words, Aphrodite is the Oriental mother-goddess, Adonis her lover; the details have been influenced by the legend of Demeter, (q.v.). The ceremony of the Adonia was intended as a charm to promote the growth of vegetation, the throwing of the gardens and images into the water being supposed to procure a supply of rain (for European parallels see Mannhardt). It is suggested (Frazer) that Adonis is not a god of vegetation generally, but specially a corn-spirit, and that the lamentation is not for the decay of vegetation in winter, but for the cruel treatment of the corn by the reaper and miller (cf. Robert Burns's *John Barleycorn*).

An important element in the story is the connection of Adonis with the boar; possibly Adonis himself was looked upon as incarnate in the swine. For a god sacrificed to himself as his own enemy, cf. the sacrifice of the goat and bull to Dionysus. It has been observed that whenever sacrifices of swine occur in the ritual of Aphrodite there is reference to Adonis. In any case, the conception of Adonis as a swine-god does not contradict the idea of him as a vegetation or corn spirit, which in many parts of Europe appears in the form of a boar or sow.

ADONIS, a genus of plants of the crowfoot family (Ranunculaceae, q.v.) known as pheasant's eye and *Flos Adonis*. There are about 20 species, natives of Europe and Asia. They are erect herbs with much divided leaves and yellow or red flowers. Three species, *A. vernalis*, *A. aestivalis* and *A. autumnalis*, are commonly cultivated. *A. autumnalis* is naturalized in England. The name is also given to the Mazarine butterfly (*Polyommatus adonis*).

ADOPTIANISM. As the theological doctrine of the Logos which bulks so largely in the writings of the apologists of the 2nd century came to the front, the trinitarian problem became acute. The necessity of a constant protest against polytheism led to a tenacious insistence on the divine unity, and the task was to reconcile this unity with the deity of Jesus Christ. Some thinkers fell back on the "modalistic" solution which regards "Father" and "Son" as two aspects of the same divine principle; but the "adoptianist" or humanitarian method was a simpler and more popular one. Basing their views on the synoptic Gospels, the adoptianists under Theodotus of Byzantium tried to found a school at Rome c. 185, asserting that Jesus was a man, imbued with the Holy Spirit's inspiration from his baptism, and so attaining such a perfection of holiness that he was adopted by God and exalted to divine dignity. Theodotus was excommunicated by the bishop of Rome, Victor, c. 195, but his followers lived on under a younger teacher, Artemon, while in the East similar views were expounded by Beryllus of Bostra and Paul of Samosata, who undoubtedly influenced Lucian of Antioch and his school, including Arius and, later, Nestorius.

There is thus a traceable historical connection between the early adoptian controversy and the struggle in Spain at the end of the 8th century, to which that name is usually given. It was indeed only a renewal, under new conditions, of the conflict between two types of thought, the rational and the mystical, the

ADONIS, A YOUTH IN CLASSICAL MYTHOLOGY, BELOVED BY APHRODITE FOR HIS GREAT BEAUTY

school of Antioch and that of Alexandria. The writings of Theodore of Mopsuestia, a typical representative of the Antiochene school, had become well known in the West, and the opposition of Islam also partly determined the form of men's views on the doctrine of Christ's person. About 780 Elipandus (born 718), archbishop of Toledo, revived and vehemently defended the expression *Christus Filius Dei adoptivus* (Christ the adopted son of God), and was aided by his much more gifted friend Felix, bishop of Urgella. They held that the duality of natures implied a distinction between two modes of sonship in Christ—the natural or proper, and the adoptive. In support of their views they appealed to scripture, and especially to Christ's fraternal relation to Christians—the brother of God's adopted sons. Christ, the firstborn among many brethren, had a natural birth at Bethlehem and also a spiritual birth begun at his baptism and consummated at his resurrection. Thus they did not teach a dual personality, nor the old Antiochene view that Christ's divine exaltation was due to his sinless virtue; they were less concerned with old disputes than with the problem as the Chalcedon decision had left it—the relation of Christ's one personality to his two natures.

Felix introduced adoptian views into that part of Spain which belonged to the Franks, and Charlemagne thought it necessary to assemble a synod at Regensburg (Ratisbon) in 792, before which the bishop was summoned to explain and justify the new doctrine. Instead of this he renounced it, and confirmed his renunciation by a solemn oath to Pope Adrian, to whom the synod sent him. The recantation was probably insincere, for on returning to his diocese he taught adoptianism as before. Another synod was held at Frankfurt in 794, by which the new doctrine was again formally condemned, though neither Felix nor any of his followers appeared.

In this synod Alcuin of York took part. A friendly letter from Alcuin, and a controversial pamphlet, to which Felix replied, were followed by the sending of several commissions of clergy to Spain to endeavour to put down the heresy. Archbishop Leidrad (died 816) of Lyons, being on one of these commissions, persuaded Felix to appear before a synod at Aix-la-Chapelle in 799. There, after six days' disputing with Alcuin, he again recanted his heresy. The rest of his life was spent under the supervision of the Archbishop at Lyons, where he died in 816. Elipandus, secure in his see at Toledo, never swerved from the adoptian views, which, however, were almost universally abandoned after the two leaders died. Adoptianism continued to be a source of theological dispute all through the middle ages, but was no longer put forward as a serious interpretation of the person of Christ.

ADOPTION is the act of a person taking upon himself the position of parent to another who is not in fact or is not treated by law as his child, and the person so acting is recognized by the law as having the rights and duties of a parent by nature. The practice prevailed in most civilized or semi-civilized nations from the earliest times. In India it is general, based on customs or religious and social ideas which vary in different parts of the country and among different classes. "The probability is that any Hindu who has no son will contemplate adoption," and the effect that every adoption must have on the devolution of property causes endless disputes, so that the courts, including the Privy Council on appeals from Indian tribunals, are constantly occupied with the litigation of this subject. An elaborate statement with regard to the Indian laws affecting adoption will be found in Mayne's *Commentaries*.

Adoption was also common among the Greeks and Romans. The Roman law was well defined and clearly stated by the jurists and, in this as well as in other subjects, had an important influence on the law of most modern European countries except England. Important changes were made from time to time, but it is to be noticed that from the earliest to the latest times some intervention on the part of the State and official sanction was required to give legal effect to adoptions. This principle has been

generally accepted in the legislation and practice of modern States and is also the basis of the recent change in English law.

By the French code conditions are laid down under which adoption may take place. To give legal effect to it, inquiry must be made by the court (1) whether the conditions have been fulfilled, (2) whether the adopter is of good repute. The act of adoption must be published and registered. The adopted person preserves his rights in his natural family of origin and gains no rights of inheritance as regards the property of the relatives of the adopter, but in the property of the adopter himself has the same rights as a legitimate child. According to the French code, the adoptive parent must be 50 years of age, and on the other hand it is provided that *l'adoption ne pourra en aucun cas avoir lieu avant la majorité de l'adopté*. A subsequent part of the code deals with the appointment of *tuteurs officieux* for protection of the interests of persons who require such oversight or assistance.

In Germany adoption is recognized and plays a most important part in the social life and conditions of the German people. It is regulated by a number of elaborate and carefully drawn provisions which are contained in the civil code. A comprehensive statement of these provisions will be found in an article by Mr. Henry Happold, of Berlin, which appeared in the *Law Magazine and Review* for Aug. 1914. It shows how complicated the question is and how many points have to be provided for. As in the French code, confirmation by a competent tribunal is necessary to give legal validity to an adoption. It is also to be noted that though the adopted child acquires the legal position of a legitimate child of the adopter, the adopter acquires no right of inheritance, and the person adopted acquires no rights as regards the relatives of the adopter.

Adoption is also provided for in the legislation of the British dominions. In West Australia, for example, a male may be adopted by a man 18 years his senior, or by a woman 30 years his senior, or a female by a woman 18 years her senior or a man 30 years her senior. An act on the subject has also been passed in South Africa.

In view of this widespread recognition of adoption by law both in ancient and modern States all over the world it seems strange that until 1926 "adoption" in the sense of the transfer of parental rights and duties in respect of a child to another person and their assumption by him was not recognized by the law of England (*see Halsbury's Commentaries*). But a relative or a stranger might put himself *in loco parentis* to a child and certain legal consequences between the parties might result from that position. Where a parent has neglected a child or it would be injurious to the child to remain in his custody he could be deprived of it or of the direction of the child's education or of the right to decide in what religion it shall be brought up (*re Newton*, 1896, 1 ch. 748). Under the Children's Act 1908 and other statutes the guardianship of children may be taken from parents who have ill-treated and neglected them and entrusted to some other person or institution, but this is not properly a case of adoption.

By the British Adoption of Children Act 1926 for the first time a definite system of legal adoption is introduced. Under that Act on application made by a person desirous of being authorized to adopt an infant the court may make an order authorizing the applicant to adopt that infant. In this procedure English law follows the precedent of Roman law and of most other countries, including the dominions, in requiring the sanction of a judicial or public authority for adoption of children. The welfare of the child is to be the paramount consideration. No payment or reward is to be received by the adoptive parent unless sanctioned by the court for some special reason. The adopted child does not lose rights of succession to the property of the natural parent or gain rights of succession to the adopter, but all rights and duties of parents or guardians as to future custody, maintenance and education are to vest in and be exercisable by and enforceable against the adopter as though the adopted child was born to the adopter in lawful wedlock. The applicant must not be under 25 years of age, must as a rule be 21 years older than the person adopted, and the court must see that the consent of the proper parties has been obtained. Either the high court, the

county courts, or courts of summary jurisdiction may deal with applications for adoption, and the effect of the order is registered.

Already the Act has been used in a very large number of cases and it is constantly found that between the adoptive parents and the children adopted ties of affection grow up very similar to those which exist between parents and their own children.

In the United States, Louisiana and Texas follow the civil law in relation to adoption, but the other states, where their jurisprudence is based on the common law, have had to enact statutes concerning the same. In many states it is required that adoptions be made only by married couples, but in a few states a single person may do so. Suitable age, financial solvency and substantial compliance with the requirements of the statutes are essential to make adoptions legal. Some states permit adoptions only of minors, and others forbid adoptions of relatives. An adopted child stands in the position of a child by blood in the matter of inheritances if the adoptive parent dies intestate.

See W. Clarke Hall, Law of Adoption and Guardianship of Infants (1928). (A. H.)

ADOR, GUSTAVE (1845-1928), Swiss statesman, was born at Geneva, Dec. 23, 1845, of a Vaudois family established there in 1814. He studied law at the academy and in 1868 became an advocate. He served his apprenticeship to politics in the cantonal government and was president of the cantonal executive in 1892 and 1906. From 1889 to 1917 he was a member of the Swiss National Council, of which he was president in 1901.

Ador gained an international reputation for the hard and disinterested work he did for the International Red Cross. He had become president of the committee four years before the World War, and when it broke out he founded an association at Geneva for facilitating communications between prisoners of war and their families and for alleviating their condition. A central agency for forwarding parcels and letters was established.

In June 1917, after the enforced resignation of Arthur Hoffmann, Ador became a member of the executive of the Swiss Federation with the portfolio of Foreign Affairs. Toward the end of 1918 he was elected president of the Swiss Federation; he retired at the end of his year of office. He headed the Swiss delegation which visited Paris and London in Jan.-Feb. 1920 to secure a reservation of the principle of the neutrality of Switzerland when she joined the League of Nations. He did important work for the League itself, first as president of the Brussels Conference of 1920 and then as president of the Economic and Financial Commission. He represented Switzerland at the various Assemblies of the League of Nations until 1924, when he retired on the ground of advancing age, although he still continued his Red Cross work. He died at Geneva on March 31, 1928. His funeral was a national ceremony, and was held in Geneva Cathedral.

ADORATION, primarily an act of homage or worship, performed among the Romans by raising the hand to the mouth, kissing it and then waving it in the direction of the adored object (Lat. *ad*, to; *os*, mouth; *i.e.*, carrying to the mouth). Saturn and Hercules were adored with the head bare. By a natural transition the homage came to be paid to monarchs by the Greeks and Romans. The Persian method was to bend the knee and fall on the face at the prince's feet, striking the earth with the forehead and kissing the ground. This striking of the earth with the forehead is the form of adoration usually paid to Eastern potentates to-day. The Jews kissed in homage. (*See* 1 Kings xix. 18, Psalms ii. 12, Hosea xiii. 2.) In England the ceremony of kissing the sovereign's hand may be described as a form of adoration. Adoration is applied in the Roman Church to the ceremony of kissing the pope's foot, a custom said to have been introduced by the popes following the example of the Emperor Diocletian. In the Roman Church a distinction is made between *Latria*, a worship due to God alone, and *Dulia* or *Hyperdulia*, the adoration paid to the Virgin, saints, martyrs, crucifixes, etc.

ADORF, a town in the republic of Saxony, 3m. from the Czechoslovakian frontier, at a height of 1,400ft. above sea. Pop. (1925) 7,722. Musical instruments, objects in mother of pearl, textiles and carpets are made.

ADOUR, a river of south-west France, rising in the department of Hautes Pyrénées, south of the Pic du Midi de Bigorre, and flowing in a wide curve to the Bay of Biscay. It traverses the beautiful valley of Campan and, after passing Bagnères de Bigorre, enters the plain of Tarbes. Beyond Tarbes numerous canals are drawn from the river for irrigation purposes; the most important is the Canal d'Alaric, which follows the right bank for 36m. Within the department of Landes it flows west and later south-west, becoming navigable at St. Sever, beyond which it is joined on the left by the Larcis, Gabas, Louts and Luy, and on the right by the Midouze. After Bayonne the river enters the sea through a dangerous estuary, after a total course of 208m. The mouth of the Adour has repeatedly shifted, its old bed being represented by the series of *étangs* and lagoons extending northwards as far as the village of Vieux Boucau (22½m.), where it debouched in the 14th century. The present channel was constructed by the engineer Louis de Foix in 1579. The area of the basin of the Adour is 6,565sq.m.

ADRA (anc. *Abdera*), a seaport of southern Spain, in the province of Almería. Pop. (1920) 8,565. Adra is the port of shipment for the lead obtained in the Sierra de Gádor near Berja, 10 m. north-east, and also exports grapes, sugar and esparto grass.

ADRAR (Berber for "uplands"), the name of various districts of the Sahara, northern Africa. Adrar Sutuf is a hilly region in southern Rio de Oro (*q.v.*). Adrar el Jebli, otherwise Adghagh, a plateau north-east of Timbuktu, is the headquarters of the Awellimiden Tuareg (see **TUAREG** and **SAHARA**). Adrar n'Ahnet and Adrar Adhafar are smaller regions in the Ahnet country south of Insalah. Adrar Temur, the best known region of the name, is in the western Sahara, 300m. N. by E. of the Senegal and separated on the north-west from Adrar Sutuf by wide valleys and sand dunes. Adrar is within the French sphere of influence. In general barren, the country, which occupies the centre of a plateau scarped steeply westwards, contains several oases, with a total population of about 10,000. The chief centres of population are Atar, Shingeti, Wadan and Ujeft, Shingeti being the chief commercial centre, whence caravans take to St. Louis gold-dust, ostrich feathers and dates. A considerable trade is also done in salt from the sebkha of Ijil, in the north-west.

Adrar or Adgar is also the name sometimes given to the chief settlement in the oasis of Tuat in the Algerian Sahara.

ADRASTUS: see **OEDIPUS**.

ADRENAL GLANDS, two flattened, yellowish brown bodies, about 2in. long which lie on the upper anterior surface of the kidneys, called also suprarenal glands. They have no ducts but pour their secretions directly into the blood stream, and are therefore called ductless or endocrine glands. Their function is closely related to that of the other ductless glands, such as the thyroid, pituitary, liver and gonads, in controlling the normal growth and development of the body and in maintaining a certain equilibrium among its various processes. Each ductless gland, besides having a special function, seems to have an effect on every other ductless gland, and these interrelated effects are so complex that it is difficult to isolate the activity of a single gland.

Removal of both adrenal glands in animals is followed by death in about 48 hours and destructive disease of these glands in man produces a symptom complex called Addison's disease, which is ultimately fatal. They therefore seem to perform some function necessary to life. Each gland consists of two distinct and originally separate layers, the yellowish cortex which covers the whole external surface and the gray central part, or medulla. The exact function of the cortex is unknown, but it seems to play a rôle in sexual development and to be the part necessary to life. The medulla, on the other hand appears in the embryo from a group of those nerve cells which migrate from the nerve layer to form ganglia or relay stations of the sympathetic nervous system. The cells of the medulla are presumed to secrete the chemical substance which has been isolated and analyzed from extracts of the whole gland.

This substance, called epinephrine or adrenalin, may be regarded, according to Cannon's theory, as an emergency messenger which supplements the activity of the sympathetic nervous sys-

tem in times of emotional stress. Under the influence of such emotions as fear and anger, the adrenals, stimulated by the sympathetic nerves, mobilize the resources of the body for such exertions as struggle or flight. The actual effects of a sudden outpouring of epinephrine into the blood may be observed experimentally and consist in an increase in the blood pressure and pulse rate, inhibition of digestion, erection of the hair, dilatation of the pupil and a rise in the blood sugar. (See **DUCTLESS GLANDS**; **ENDOCRINOLOGY**; **SUPRARENAL EXTRACT**.)

ADRENALIN (Adrenine, Epinephrine or Hemieine) is obtained from the medulla of the suprarenal glands of animals, ductless glands situated immediately above each kidney. Its chief action is upon the heart and small arteries. The heart is somewhat slowed, but the force of its contractions is increased and the arteries are constricted, thus causing a considerable rise in the general blood pressure. An aqueous solution (1 part in 1,000) is a very efficient haemostatic and may be used together with cocaine for painless, bloodless operations on the eyes, teeth, etc. Adrenalin is one of the most efficacious drugs for stopping a paroxysm of asthma. (See **HORMONES**; **SUPRARENAL EXTRACT**.)

ADRIA (anc. *Atria*; the form Adria or Hadria is less correct: Atria was a town in Picenum, the modern Atri), town and episcopal see, province of Rovigo, Italy, 15m. E. by rail from the town of Rovigo. It is situated between the mouths of the Adige and the Po, about 13½m. from the sea and but 13ft. above it. Pop. (1921), 13,817 (town), 19,827 (commune). It gave its name to the Adriatic and was an important Etruscan harbour. The town was famous in Aristotle's day for a special breed of fowls. Even then river silt rendered access difficult, and the historian Philistus excavated a canal to the sea. This was still open in the imperial period, and the town possessed its own guild of sailors; but its importance gradually decreased. The remains of the ancient town lie 10–20ft. below the modern level.

ADRIAN or **HADRIAN** (Lat. *Hadrianus*), the name of six popes.

ADRIAN I., pope from 772 to 795, was the son of Theodore, a Roman nobleman. Soon after his accession Adrian found it necessary to invoke the aid of Charlemagne against Desiderius, king of the Lombards. In his contest with the Greek empire and the Lombard princes of Benevento, Adrian remained faithful to the Frankish alliance, and the friendly relations between pope and emperor were not disturbed by the difference which arose between them on the question of veneration of images, to which Charlemagne and the Gallican Church were strongly opposed, while Adrian approved the decree of the council of Nicaea (787), confirming the practice and excommunicating the iconoclasts. The dispute remained unsettled at Adrian's death. Adrian restored the ancient aqueducts of Rome, and governed his little state with a firm and skilful hand.

ADRIAN II., pope from 867 to 872, was a member of a noble Roman family, and became pope in 867, at an advanced age. Like his predecessor, Nicholas, Adrian II. was forced to submit, at least in temporal affairs, to the tutelage of the emperor, Louis II., who placed him under the surveillance of Arsenius, bishop of Orta, his confidential adviser, and Arsenius's son Anastasius, the librarian. Adrian had married in his youth, and his wife and daughter were still living. They were carried off and assassinated by Anastasius's brother, Eleutherius. Adrian died in 872.

ADRIAN III., pope, was born at Rome. He succeeded Martin II. in 884, and died in 885, on a journey to Worms.

ADRIAN IV. (Nicholas Breakspear), pope from 1154 to 1159, the only Englishman who has occupied the papal chair, was born before A.D. 1100 at Langley, near St. Albans, in Hertfordshire. Nicholas went to Paris and became a monk of the cloister of St. Rufus, near Arles. He rose to be prior, and in 1137 was unanimously elected abbot. Eugenius III. created him cardinal bishop of Albano. From 1152 to 1154 Nicholas was in Scandinavia as legate; organizing the affairs of the new Norwegian archbishopric of Trondhjem, and arranging for the recognition of Uppsala as a metropolitan see in 1164. Nicholas was elected pope on Dec. 4, 1154. He at once endeavoured to compass the overthrow of Arnold of Brescia, the leader of anti-papal sentiment in Rome.

Disorders ending with the murder of a cardinal led Adrian, shortly before Palm Sunday 1155, to put Rome under the interdict. The senate thereupon exiled Arnold, and the pope, with the co-operation of Frederick I. Barbarossa, was instrumental in procuring his execution. Adrian crowned the emperor at St. Peter's on June 18, 1155, a ceremony which so incensed the Romans that the pope had to leave the city for some months. At the diet of Besançon in Oct. 1157, the legates presented to Barbarossa a letter from Adrian which alluded to the *beneficia* conferred upon the emperor, and the German chancellor translated this *beneficia* in the feudal sense. In the storm which ensued the legates were glad to escape with their lives, and the incident at length closed with a letter from the pope, declaring that by *beneficium* he meant merely *bonum factum*. The breach subsequently widened, and Adrian was about to excommunicate the emperor when he died at Anagnina on Sept. 1, 1159.

In 1155 Henry II. of England sent an embassy to Adrian to ask for permission to invade and subjugate Ireland, in order to gain absolute ownership of that isle. Unwilling to grant a request counter to the papal claim (based on the forged Donation of Constantine) to dominion over the islands of the sea, Adrian proposed that the king should become hereditary feudal possessor of Ireland while recognizing the pope as overlord. This compromise did not satisfy Henry, so the matter dropped; Henry's subsequent title to Ireland rested on conquest, not on papal concession, and was therefore absolute. The much-discussed bull *Laudabiliter* is, however, not genuine.

See Herzog-Hauck, *Realencyklopädie*, 3rd ed. (excellent bibliography), and Wetzer und Welte, *Kirchenlexikon*, 2nd ed. under "Hadrian IV."; also Oliver J. Thatcher, *Studies concerning Adrian IV.* (Chicago, 1903); R. Raby, *Pope Adrian IV.; An Historical Sketch* (London, 1849); and A. H. Tarleton, *Life of Nicholas Breakspear* (London, 1896).

ADRIAN V. (Ottobuono de' Fieschi), pope in 1276, was a Genoese who was created cardinal deacon by his uncle Innocent IV. In 1264 he was sent to England to mediate between Henry III. and his barons. He was elected pope to succeed Innocent V. on July 11, 1276, but died at Viterbo on Aug. 18, without having been ordained even to the priesthood.

ADRIAN VI. (Adrian Dedel, not Boyens, probably not Rodenburgh, 1459-1523), pope from 1522 to 1523, was born at Utrecht in March 1459, and became tutor to the seven-year-old Charles V. Charles secured his succession to the see of Tortosa, and on Nov. 14, 1516, commissioned him inquisitor-general of Aragon. During the minority of Charles, Adrian was associated with Cardinal Ximenes in governing Spain. After the death of the latter Adrian was appointed, on March 14, 1518, general of the reunited inquisitions of Castile and Aragon, in which capacity he acted until his departure from Tarragona for Rome on Aug. 4, 1522. When Charles left for the Netherlands in 1520 he made Adrian regent of Spain. In 1517 Leo X. had created him cardinal priest *SS. Ioannis et Pauli*; on Jan. 9, 1522, he was almost unanimously elected pope. Crowned in St. Peter's on Aug. 31, at the age of 63, he entered upon the lonely path of the reformer. His programme was to attack notorious abuses one by one; but in his attempt to improve the system of granting indulgences he was hampered by his cardinals; reduction of the number of matrimonial dispensations was impossible, for the income had been farmed out for years in advance by Leo X. In dealing with the early stages of the Protestant revolt in Germany Adrian did not fully recognize the gravity of the situation. At the diet which opened in Dec. 1522 at Nuremberg he was represented by Chiericati, whose instructions contain the frank admission that the whole disorder of the church had perchance proceeded from the Curia itself, and that there the reform should begin. But Adrian was stoutly opposed to doctrinal changes, and demanded the punishment of Luther for heresy. The statement in one of his works that the pope could err in matters of faith ("*haeresim per suam determinationem aut Decretalem asserendo*") has attracted attention; but as it is a private opinion, not an *ex cathedra* pronouncement, it is held not to prejudice the dogma of papal infallibility. On Sept. 14, 1523, he died, after a pontificate too short to be effective.

BIBLIOGRAPHY.—Most of Adrian VI.'s official papers disappeared

soon after his death. He published *Quaestiones in quantum sententiarum praesertim circa sacramenta* (Paris, 1512, 1516, 1518, 1537; Rome, 1522), and *Quaestiones quodlibeticae XII.* (1st ed. Louvain, 1515). See L. Pastor in *Geschichte der Päpste*, vol. iv. pt. ii.; *Adrian VI. und Klemens VII.* (Freiburg, 1907); also Wetzer und Welte, *Kirchenlexikon*, 2nd ed., and Herzog-Hauck, *Realencyklopädie*, 3rd ed., under "Hadrian VI."; H. Hurter, *Nomenclator literarius recentioris theologiae catholicae*, tom. iv. Innsbruck (1899), 1027; *The Cambridge Modern History*, vol. ii. (1904), 19-21; H. C. Bibliographie* (1905); and *Liber Pontificalis*, ed. Duchesne (2 vols. Paris 1886-92).

ADRIAN, SAINT, one of the praetorian guards of the Emperor Galerius Maximian, who, becoming a convert to Christianity, was martyred at Nicomedia on March 4, 303. His limbs were struck off on an anvil, and he was then beheaded. St. Adrian's festival, with that of his wife, St. Natalia, is kept on Sept. 8. He is specially a patron of soldiers, and is much revered in Flanders, Germany and the north of France.

ADRIAN, a city in south-eastern Michigan, U.S.A., about 30m. N.W. of Toledo. It is the county seat of Lenawee county, and is served by the New York Central, the Wabash, the Detroit, Toledo and Ironton and the Toledo and Western (electric) railways. The population was 11,878 in 1920, and was 13,064 in 1930 (Federal census).

The county, a rich farming land, contains beautiful lakes. Adrian's trade in grain, livestock and dairy products is extensive. Woven wire fence was first made here, and is the leading manufacture. Electrical appliances, phonographs, furniture, leather, knitted goods, automobile supplies and condensed milk are also produced. There were 42 factories in 1927, with an output valued at \$11,330,448. Adrian college (established 1859, continuing Michigan Union college, which had been organized at Leoni in 1852) is a Methodist Protestant co-educational institution. It has a beautiful campus of 22ac. and an enrolment of about 300. The State training-school for girls (1879) is one mile north of the city.

Adrian was laid out in 1828; incorporated as a village in 1836; became the county seat in 1838; and was chartered as a city in 1853. Tradition says that it was named after the emperor Hadrian.

ADRIANI, GIOVANNI BATTISTA (1513-1579), Italian historian, was born of a patrician family of Florence, and was secretary to the republic. At the instance of Cosimo I. he wrote *Istoria di suoi tempi* (1583; modern ed. 1872), covering the years 1536 to 1574.

See G. M. Mazzucchelli, *Gli Scrittori d'Italia*, i. p. 151 (1753).

ADRIANOPE, the capital of the vilayet of Adrianople, Turkey in Europe, 137m. by rail W.N.W. of Constantinople. It occupies both banks of the river Tunja, at its confluence with the Maritsa, which is navigable to this point in spring and winter. The nearest seaport by rail is Dédéagatch, west of the Maritsa; Enos, at the river-mouth, is the nearest by water. Adrianople is on the railway from Belgrade and Sofia to Constantinople and Salonica. In appearance it is thoroughly oriental—a mass of mean, irregular wooden buildings, threaded by narrow tortuous streets, with a few better buildings. Earlier buildings include Eski Serai, a half-ruined palace of the sultans; the bazaar of Ali Pasha; and the fine 16th century mosque of the sultan Selim II., built by Sinan.

The war of 1877-78 impoverished Adrianople, and the creation of a customs cordon between it and Eastern Rumelia (1885) put an end to its commercial headship of Thrace, and parts of Bulgaria and Philippopolis and Burgas took most of its trade. The city manufactures silk, leather, tapestry, woollens, linen, and cotton, and has an active general trade. Besides fruits and agricultural produce, its exports include raw silk, cotton, opium, rose-water, attar of roses, wax, and the dye known as turkey red. The surrounding country is extremely fertile, and its wines are the best produced in Turkey. The city is supplied with fresh water by means of an aqueduct carried by arches over an extensive valley. There is also a fine stone bridge over the Tunja.

Adrianople was originally known as Uskadama or Uskodama, but was renamed and enlarged by the Roman emperor Hadrian

(117-138). In 378 the Romans were here defeated by the Goths. Adrianople was the residence of the Turkish sultans from 1361, when it was captured by Murad I., until 1453, when Constantinople fell. It was occupied by the Russians in 1829 and 1878 (*see* RUSSO-TURKISH WARS).

During the first Balkan War Adrianople was taken from the Turks by Bulgars, with Serbian assistance, in 1913, after a siege of 155 days. During the second Balkan War, in June, 1913, the Turks retook the town and, by the Treaty of Constantinople, signed on Sept. 29, 1913, it was ceded, together with Karagatch, to Turkey by Bulgaria. After the World War, the Greek army, commissioned to restore order in Thrace (May, 1920), entered Adrianople in July, and it was ceded to them (Aug. 10, 1920) by the Treaty of Sévres. During the Graeco-Turkish War of 1923 the Greeks occupied Karagatch, the railway station of which is very important for the traffic of Dédeagatch and had therefore been abandoned by Turkey to Bulgaria in 1915. On leaving it they destroyed many buildings and removed the machinery from the mills. After the close of the World War Adrianople was again restored to Turkey by the Mudania Convention of October 1922, confirmed by the Treaty of Lausanne of July 24, 1923. A protocol subjected the Greek inhabitants of Karagatch to the exchange of populations, compelling them to emigrate six months after the re-establishment of peace.

The population in 1924 was given as only 56,347, as compared with about 80,000 in 1905 and 65,454 in 1911. This diminution is due to the emigration of the population, with the exception of the Jews, after the successive occupations of the city. The south-western portion of the city, burnt down in 1905, was rebuilt with comparatively broad streets. The railway station, which stands among ruins, has been rebuilt.

See British and Foreign State Papers, 1914, part 1. vol. cvii., p. 706 (1920); vol. cxiii., p. 652 (1917-23); *Treaty Series*, No. 16 (1923).

Adrianople, Battle of, 378.—This is one of the milestones of military, and, in less degree, of political history, for the Roman Empire's barriers against the barbarians were breached so gravely that temporary repair was effected only by the substitution of the forces of destruction—the Goths and Teutons—for the regular imperial forces, and it also marks the changing relative values of infantry and cavalry.

The Visigoths were allowed in 376 to move inside the Roman border to escape the pressure of the Huns. A year later they revolted, and in 378 the Emperor Valens (*q.v.*) determined to subdue them. When (Aug. 9) the attack was made the main body of the Gothic cavalry was away foraging; Gothic offers of surrender, made to regain time for their recall, failed; the Romans, with the legions in the centre, and the cavalry on the wings as customarily, assaulted the Goths' position around the great wagon-laager, when suddenly the enemy squadrons appeared on the scene and charged "like a thunder-bolt" against their left flank. The Roman cavalry were swept aside, while the Gothic horse drove the left wing infantry in upon the centre and reserve, the pressure forcing the Romans into a disordered mass which was too dense to allow them to use their weapons. Surrounded on all sides and forsaken by their right wing cavalry and foot, the Roman main body was massacred, and only after two-thirds of the army had fallen could the survivors break through and follow the retreat of the right wing.

That evening the sun set for all time on the glory of the legions, the infantry who had been the foundation of Roman world-power, and a thousand years' era of cavalry supremacy was ushered in. Henceforth cavalry became the predominant arm of the Roman army, as reorganized by Theodosius, and 150 years later, during Justinian's revival of Roman power, we find Belisarius risking battle and achieving victory without waiting for his infantry to arrive on the battlefield. (*See* ROMAN ARMY.)

ADRIATIC SEA (ancient *Adria* or *Hadria*), an arm of the Mediterranean sea separating Italy from the Balkan peninsula, occupying a structural depression between the New Fold mountain systems of the Apennines and the Dinaric Alps. The sea extends from north-west to south-east between lat. 40° and 45° 45'

N., a length of nearly 500 miles. Its average width is *c.* 110 m.; but the Strait of Otranto is only 45 miles. The Italian shore, except where the Apennines fall steeply to a narrow coastal ledge between Rimini and Mt. Gargano, is low, merging in the north-west into the marshes and lagoons about the delta of the Po, the basin of which is structurally a continuation of the Adriatic. The sediment brought by the river has pushed forward the coast-line for several miles within historic times. The east coast is generally rugged, and south of the Istrian peninsula, placed between the Gulf of Trieste and the Strait of Quarnero, is fringed with islands (*e.g.*, Veglia, Cherso, Brazza and Curzola) and with many small islets and rocks which represent submerged parallel deviations of the longitudinal mountain folds. Opposite the islands of the Dalmatian coast the sea is shallow, and in the extreme north rarely exceeds 25 fathoms. But between Sebenico and the Abruzzi a well marked depression occurs, with depths exceeding 100 fathoms. South of this shallower water continues, but beyond Mt. Gargano and south of Ragusa depths of over 500 fathoms are reached, and a small area of this basin falls below 800 fathoms. Opposite this deeper water, at the 100 fathom line, the islands of the Balkan coast disappear. The absence of good harbours on the Italian side contrasts with the excellent inlets of the Dalmatian coast. Here the rocks are mainly cretaceous and have characteristic features of dry barren soil and poor vegetation despite the fairly heavy rainfall. Some of the islands, however, are luxuriant with dark vegetation. The *bora* (north-east wind), and the prevalence of sudden squalls, are dangers to navigation in winter. Tidal movement is slight. (*See also* MEDITERRANEAN.)

For the "Marriage of the Adriatic," or more properly "of the sea," a ceremony formerly performed by the doge of Venice, *see* the article BUCENTAUR. (X.)

Political Question.—Before the World War the Adriatic littoral belonged to four States, Italy, Austria-Hungary, Montenegro and Albania, and in practice to the two first. In negotiating the "secret" Treaty of London of April 26, 1915, the Italian Government aimed at securing, in return for Italy's entrance into the war on the side of the Allies, the conversion of the Adriatic into an Italian lake—*il nostro mare*.

Article 4 of that treaty provided that "all Istria up to the Quarnero and comprising Volosca, just beyond Abbazia and the Istrian islands of Cherso, Lussin . . . and the adjoining islets" with Castua and Mattuglie, the station for Abbazia, should become Italian. Article 5 declared that Italy "shall equally receive the province of Dalmatia . . . comprising Lisarica and Tribanj in the north" to a line as far south as Cape Planca (Ploče), between Sebenico and Traù (Trogir), on the mainland, with "all the islands . . . from Premuda, Selve (Silba) and Pago in the north to Meleda in the south, comprising Lissa, Lesina, Curzola, Lagosta (Lastovo) and Pelagosa, with the solitary exception of Great Zirona (Veli Drvenik) and Small Zirona (Mali Drvenik), Bua (Ciovo), Solta and Brazza." The whole coast from Cape Planca to the "southern root" of the peninsula of Sabbioncello and from a point 10 km. to the south of Ragusa Vecchia (Cavtat) to the river Viosa (north of Valona), except Montenegro, and all the non-Italian islands were to be neutralized. The rest of the Dalmatian coast, besides Fiume and the islands of Veglia and Arbe in the north, were to go to Croatia, Serbia and Montenegro, besides the Albanian roadstead of San Giovanni di Medua (the landing-place for Scutari); but Durazzo was to be Albanian.

Article 6 further conferred upon Italy "the entire sovereignty over Valona, the island of Saseno and a territory sufficiently extended to assure the defence of those points" (from the Viosa . . . approximately to the northern frontier of the district of Chimara). Article 7 neutralized the coast south of the above as far as Cape Stylos opposite Corfu. This treaty violated every principle of nationality; it assigned to Italy provinces overwhelmingly Slav (for the Italian population of Dalmatia was only 3.5%), it dismembered Albania and would have created a new Irredentism far more powerful than that which Italy had fought to cure. The entrance of the United States into the war made the treaty a dead letter, although Baron Sonnino, then Italian Minister of Foreign Affairs, still clung to it, for President Wilson refused

to be bound by it, and even some Italians, notably Bissolati and Prof. Salvemini disapproved of it.

Thus began the wearisome "Adriatic question," which at times threatened war between Italy and the Yugoslavs, and attempts were made by British publicists, notably Messrs. Steed and Seton-Watson, to bring about an agreement, the "Pact of Rome," between the two races. The departure of Sig. Orlando, then the Italian premier, and Baron Sonnino from the Paris Conference was due to this question, which was not regulated till the Treaty of Rapallo between the Italians and the Yugoslavs on Nov. 12, 1920, largely the work of Signor Giolitti and Count Sforza, who had meanwhile become Premier and Minister of Foreign Affairs. In Dalmatia, Italy obtained only Zara—the one overwhelmingly Italian town—with an enclave which included the Albanian settlement of Borgo Erizzo—and the island of Lagosta. Italy kept the whole of Istria (despite its large Slav minority) with the islands of Cherso and Lussin and that of Pelagosa. "All the other islands which belonged to the former Austro-Hungarian Monarchy" were "recognized as forming part of the Kingdom of the Serbs, Croats and Slovenes."

By article 4, both States recognized the full liberty and independence of the State of Fiume (*q.v.*), consisting of the *corpus separatum* (the city) and a corridor south of Castua (which became Yugoslav) connecting it with Volosca and Abbazia. Sig. Giolitti evacuated Albania, where Italy retains only the island of Saseno. Mussolini observed the Rapallo Treaty and subsequently settled the question of Fiume, which is now Italian.

The Adriatic is described at Belgrade, no less than in Rome, as "our sea," but the keys of the mouth of the Adriatic, Brindisi and Saseno, are in Italian hands.

Salvemini, *La questione dell'Adriatico* (1919); Adriaticus, *La question Adriatique*; Recueil de documents officiels (1920); see also "The Problem of Dalmatia" by "Antenor" in *History*, April 1919; E. J. and C. G. Woodhouse, *Italy and the Yugoslavs* (Boston, 1920). (W. M.)

ADSCRIPT. A *villein* was called an "adscript of the soil" (*adscriptus glebae*) since he could be sold or transferred with it, as in feudal days, and as in Russia until 1861. See **VILLEINAGE**.

ADSORPTION. If a gas or solution is brought into contact with a very finely divided or porous material (*e.g.*, charcoal, kaolin) the pressure of the gas or the concentration of the solution generally decreases, the gas or solute being concentrated on the surface of the solid. This phenomenon is known as adsorption, and the finely divided or porous solid is called the adsorbent. The gas or solid can be easily removed from the surface of the solid by exhaustion, heating or washing. The efficiency of an adsorbent depends largely on its specific surface (*i.e.*, area of surface per unit mass), but as we shall see later it also depends on other factors.

This phenomenon of *adsorption* is to be distinguished from *absorption* by the fact that the adsorbed gas or solute is concentrated on the surface of the adsorbent, while in absorption the matter taken up penetrates throughout the mass of the absorbing agent. (See **ELECTRIC LAMP**.)

The Adsorption of Gases.—Wood charcoal is very porous; so that it possesses a large specific surface, and is very efficient as an adsorbent. On exposure to the air it adsorbs the atmospheric gases. In order to demonstrate its adsorbing properties it should first be heated to redness in order to remove the adsorbed gases from its surface. If then it is brought into a vessel containing a gas, an immediate diminution of pressure would be indicated by an attached manometer, reaching eventually a constant value.

This final equilibrium pressure depends on the temperature, the nature of the gas and adsorbent, and also on the specific surface of the latter. Adsorption can also be shown by filling a glass tube with ammonia with the open end of the tube dipping into a trough of mercury. A piece of charcoal (after being heated to redness and allowed to cool) is introduced on to the surface of the mercury in the tube. The mercury rises rapidly in the tube, indicating a rapid diminution in the volume of the gas. The ammonia can be recovered from the charcoal by heat or by exhaustion. Hydrogen burns with a pale blue flame which is non-luminous; if the hydrogen is bubbled through benzene it burns with a smoky luminous flame due to the presence of benzene vapour. If the mixture of hydrogen and benzene vapour is passed over charcoal the benzene is adsorbed, as shown by the non-luminous character of the flame of the gas which passes through.

When an adsorbent remains for some time in contact with a gas, an adsorption equilibrium is established, the amount of gas adsorbed per unit mass of the adsorbent increasing with decreasing temperature and with increasing pressure. By plotting the pressures p as abscissae, and the amount of gas adsorbed per unit mass of the adsorbent as ordinates, curves similar to those shown in figure (Curve 3) are obtained. Such a curve, which represents the amount adsorbed at constant temperature, is termed an "adsorption isothermal." It is seen from the curves that the amount of gas adsorbed is not proportional to the gas pressure, but that it increases much more rapidly at low pressures than at high pressures. The adsorption isothermal can be represented by the equation:

$$x/m = ap^{1/n}$$

where x is the amount of gas adsorbed by m grams of the adsorbent at gas pressure p ; a and n are arbitrary constants. The value of a depends on the units of measurement, and n is characteristic of the adsorbent and of the gas. Thus, for the adsorption of CO_2 , NH_3 or SO_2 on charcoal, the values of $1/n$ are 0.394, 0.437 and 0.324, respectively, whereas for the same three gases on glass, the values are 0.66, 0.53, 0.28. These constants also vary with the temperature, $1/n$ approaching unity at high temperatures. The temperature at which the unity value is reached depends on the critical temperature of the gas. For hydrogen, which has a very low critical temperature, the value of $1/n$ is unity at ordinary temperatures, but it is less than unity at the temperature of liquid air. In general the value of $1/n$ becomes 1 at temperatures considerably above the critical temperature of the gas.

The logarithmic equation of the isotherm is:

$$\log x/m = \log a + 1/n \log p,$$

which is the equation of a straight line. On plotting experimental values, however, it is found that it only holds at low pressures. As the pressure increases the logarithmic curve ceases to be a straight line, and bends towards the pressure axis. The pressure at which this deflection occurs varies from gas to gas; it is lower the more readily the gas is condensed. Below the critical temperature the equation does not hold for even low pressures. The adsorbability of gases runs more or less parallel with their condensability. The above equations, which are due to Freundlich, imply that an indefinite increase in pressure produces an indefinitely large adsorption. Recent work by Langmuir and others indicates that on increasing the pressure surface saturation is reached. Arrhenius introduced this (s) into his equation for adsorption, viz., $k \cdot dx/dp = (s-x)/x$.

The rate of adsorption is high, equilibrium being reached in a few minutes. The kinetic equation is $dp/dt = k(p_\infty - p)$, dp/dt being the rate of diminution of pressure; p_∞ and p being the pressures at equilibrium and at time t respectively. Since adsorption is decreased by a rise in temperature, it follows that it is accompanied by evolution of heat. This can be readily shown by means of a thermometer immersed in the adsorbent when adsorption takes place. The heat of adsorption can be calculated from the temperature-coefficient of adsorption. If the adsorbent is in contact with several gases at the same time, the adsorption of each is diminished, and at equilibrium the amounts of the several gases adsorbed are in proportion to their respective adsorbabilities. Nothing is definitely known about the influence of the nature of

CURVES OF THREE POSSIBLE TYPES OF RELATION BETWEEN THE PROPORTION OF GAS ADSORBED ON THE SURFACE AND THE PRESSURE OF THE GAS

the adsorbent. Wood or animal charcoal is by far the most efficient. Silica gel is also a very powerful adsorbent. In the adsorption of gases on the surface of solids the adsorbed gas forms a layer one molecule thick on the adsorbent, but in the adsorption of vapours the layer may be several molecules thick.

Adsorption in Solution.—Small drops of a pure liquid, when free from external influences assume a spherical shape. This can be seen with drops of water on a waxy surface—if the drops are large then the effect of gravity is appreciable and the drops become flattened. A liquid suspended in another liquid of the same density and in which it is insoluble also assumes a spherical shape. The second law of thermodynamics states that free energy always tends to become a minimum, and in the case of liquids the free surface energy therefore tends towards a minimum. The free surface energy of a liquid is the product of its surface tension and the area of its surface, so that if there is a diminution in the surface tension or in the superficial area there is a diminution in the free surface energy. A pure liquid cannot change its surface tension, but its surface area is reduced to a minimum if it assumes a spherical shape, for it is characteristic of a sphere that for a given volume it has the minimum surface. If we consider a liquid containing a substance in solution, and having a lower surface tension than the pure liquid, *e.g.*, a solution of one of the fatty acids in water, we find that the lowering of the surface tension results in a lowering of the free surface energy of the liquid; the effect is all the greater the more concentrated the solution. The free surface energy would decrease still further if there were an unequal distribution of the solute in the solution, *i.e.*, if the concentration of the surface layer of the solution were greater than the concentration of the bulk of the solution. This is found to be the case in all solutions where the solute lowers the surface tension of the solvent, and we may state generally that those solutes which decrease the surface tension of the solvent are concentrated at the surface, and, conversely, those solutes which raise the surface tension of the solvent have a lower concentration in the surface layers than in the bulk of the solution. This generalization is known as Gibbs's adsorption theorem. The increase in concentration of the solute at the surface is a case of adsorption of the solute at this surface. Solutions of low surface tension are apt to foam or froth. Conditions favourable to frothing are low surface tension, low volatility and not too high mobility of the liquid. Pure liquids do not froth. A solution of soap in water froths very readily; if this froth is collected it is found to contain a much greater concentration of soap than the bulk of the liquid, *i.e.*, the soap has been adsorbed on the air-liquid surface.

Adsorption of Solutes by Solids.—The adsorption of solvents by solids is explained in exactly the same way as that of solutes at the gas-liquid interface. It is the application of Gibbs's adsorption theorem to the distribution of the solute. Those solutes which lower the surface tension at the liquid-solid interface will be concentrated or adsorbed at that surface and vice versa. When the surface area of the solid is very large (porous or very finely divided solids), the free surface energy assumes very high values, and may be considerably reduced as a result of adsorption. In the case of the gas liquid interface, the surface tension, and consequently the free surface energy, can be readily determined, and thus the results of adsorption interpreted quantitatively. It does not follow that a decrease in the surface tension at the gas-liquid interface involves a decrease in the surface tension at the liquid-solid interface. The measurement of the surface tension in the latter case is extremely difficult, and the results are not trustworthy. If charcoal is shaken with a solution of methylene blue in water, a decrease in the concentration of the solution is indicated by a decrease in the intensity of its colour. A similar result is obtained by shaking charcoal with a solution of the fatty acids, amines, phenols, etc., in water; the solutes are adsorbed by the charcoal, since they lower the surface tension and therefore the free surface energy at the solution-charcoal interface.

In the case of solutes which raise the surface tension of the solvent, the converse holds, *i.e.*, the concentration of the surface

layers will be less than that of the bulk of the solution, and the concentration of the solvent is relatively greater at the solid-liquid surface. We thus have two cases of adsorption; the first, resulting in a diminution in the concentration of the solution, is generally known as positive adsorption, and the second, resulting in an increase in the concentration of the solution, is known as negative adsorption.

It has been suggested that liquids in contact with charcoal are actually compressed on the surface of the solid, and this pressure has been estimated at 10,000 to 60,000 atmospheres. Positive adsorption is utilized largely in industry. Bancroft has determined the efficiencies of the more important decolorizing agents.

Material	Efficiency	Material	Efficiency
Alumina	100	Bone charcoal	17
Fuller's earth	50	Ferric oxide	3
Bauxite	40	Kieselguhr	3

The amount of adsorption generally decreases with increasing temperature, but the rate of adsorption increases with increasing temperature. In adsorption efficiency, specific surface plays a very important part—the higher the specific surface the more efficient the adsorbent. Freundlich's isotherm for adsorption from solution is:

$$x/m = Kc^{1/n};$$

x/m is the amount of solute adsorbed per unit mass of adsorbent; c is the concentration of the solution at equilibrium; K and n are constants, the values of which vary considerably (*e.g.*, n varies between 1 and 5), and depend on the temperature, nature and specific surface of the adsorbent, and also on the solvent.

The adsorption isothermal defines the relationship between concentration in the solution and the quantity adsorbed, as with gases; at small concentrations relatively more is adsorbed than at higher concentrations. This relationship only holds for dilute solutions: at high concentrations a saturation value is reached—in fact, at very high concentrations the amount adsorbed seems to decrease, due to more of the solvent being adsorbed. The adsorption of a salt is an additive property of the cation and the anion; thus, the adsorbability of a series of potassium salts is in the same order as that of sodium salts. The order of adsorbability of cations is as follows: Organic dyes (basic), H^+ , Ag^+ , Hg^{2+} , Cu^{2+} , Al^{+++} , Zn^{2+} , Mg^{2+} , Ca^{2+} , NH_4^+ , K^+ , Na^+ ; and for the anions: Organic dyes (acidic), OH^- , CN^- , S^{--} , I^- , NO_3^- , Br^- , Cl^- , SO_4^{--} . Apart from the organic dyes, hydrogen and hydroxyl ions are the most readily adsorbed. In the case of the metals, the valency and the position of the element in the electrolytic potential series seem to be of importance. This preferential adsorption of H^+ and OH^- gives the adsorbent a positive or negative charge, and explains the origin of the electric charge on colloidal particles. The coagulation of colloidal solutions by electrolytes is also explained by the preferential adsorption on the surface of the colloidal particles of one ion which neutralizes its charge (*see COLLOIDS*).

If we consider the adsorption of methylene blue by kaolin, we find that the adsorbent is very efficient, much more efficient than in the adsorption of the fatty acids, etc. The solute in the case of methylene blue is highly ionized, and it comes into contact with a solid (calcium silicate) whose anion is extremely insoluble, but whose cation readily goes into solution. The calcium ions of the solid therefore change places with the methylene blue cation in solution. This kind of adsorption is known as exchange adsorption and is polar in character.

Theories of Adsorption.—Three theories of adsorption have been advanced: (1) Chemical theory; (2) Solution theory; (3) Surface theory.

Chemical Theory.—If one regards adsorption equilibria as chemical equilibria, then the adsorption isotherm must be a special case of the law of mass action (*see CHEMICAL ACTION*). If one considers the adsorbent and the compound of the adsorbent and adsorbed substance as solid phases of constant composition, one must also assume a phase of variable composition (a solid solution) in order to apply the adsorption isotherm. Then the adsorption equilibrium can be regarded as a chemical equilibrium. The opponents of this theory claim that chemical equilibrium is very

specific, the equilibrium and velocity coefficients vary considerably with the number of reacting molecules (in the adsorption isotherm this is $1/n$). Adsorption equilibrium, on the other hand, is but slightly specific; the constant K (the equilibrium constant in the law of mass action) does not vary much under very different conditions; the same applies to $1/n$. The chemical theory makes it difficult to understand the relation between the adsorbability of a gas and its condensability, or the influence of a solute on the surface tension of a solvent and the readiness with which it is adsorbed. Again, the chemically inactive gases helium and argon are adsorbed.

Solution Theory.—Adsorption as a solution phenomenon has but few adherents. In adsorption, equilibrium is rapidly established, but diffusion in a solid is extremely slow. Again to bring the phenomenon of adsorption into line with Henry's law, one must assume the dissociation of the gas, which is highly improbable in most cases. Some suggest that the gas is liquefied on the surface of the solid; this explains the relationship between adsorption and condensability of gases, but does not assist in the case of adsorption from solution.

Surface Theory.—Many regard adsorption merely as a concentration on the surface of the adsorbent in accordance with the second law of thermodynamics. Assuming the validity of the gas laws and van't Hoff's law for dilute solutions, the following equation can be deduced thermodynamically:

$$u = -c/RT \cdot d\sigma/dc$$

where u =excess of gas or solute in the surface layer; c =concentration of solution (pressure of gas); R =gas constant; and T =absolute temperature.

It is difficult to test this equation in the case of solid surfaces because of the difficulty of determining the value of the surface tension σ . In the case of gas-liquid and liquid-liquid surfaces, the experimental results agree qualitatively, but quantitative results are difficult to obtain on account of the necessity of using very large surfaces.

The laws of chemical combination, solution and adsorption are represented by the curves in figure.

Curve 1: $x=K$ (law of constant composition). Action is due to the attractive forces between the atoms or molecules.

Curve 2: $x/p=K$ (Henry's law of solubility).

Curve 3: $x/p=K^{1/n}$. K is given an exponent between 0 and 1, the values found in the case of chemical combination and solubility respectively. This phenomenon is due to molecular attraction and also to the kinetic motion of the molecules.

Modern research tends to bring together the extreme views (chemical and physical) of adsorption. At one time the phenomenon was regarded as purely physical and non-specific; adsorption is now shown to depend on a variety of factors, many of which are extremely specific and closely related to chemical phenomena. I. Langmuir and N. K. Adam studied the behaviour of oils spread in unimolecular layers on water, and found that the forces operating were not readily distinguishable from chemical forces or affinity.

Applications of Adsorption.—Cocoa-nut charcoal is generally employed at very low temperatures (temperature of liquid air). Adsorption facilitates the separation of the difficultly adsorbed gases hydrogen and helium from the more easily adsorbed, such as nitrogen and oxygen. The effectiveness of gas masks depends on the efficiency of the charcoal which they contain for adsorbing such poisonous gases as chlorine, phosgene, etc. A very active and porous grade of charcoal is also used in an important process for the adsorption of gasoline from natural gas.

Adsorption is of very great importance in chemical reactions, for many of them are accelerated on various solid surfaces, and this has found extensive application in industry. Mention need only be made of the contact process for the manufacture of sulphuric acid (*q.v.*), the synthesis of ammonia (*q.v.*), hydrogenation (*q.v.*) of oils, etc. Catalytic poisoning is also due to adsorption. (See CATALYSIS.) In dyeing, adsorption plays a very prom-

inent part in the fixing of the dye on the material, although the formation of compounds may also play a part in some cases. In the photographic plate the silver bromide is in the colloidal form and adsorbs the sensitiser. In brewing, the gas content and taste of the beer depend largely on adsorption of the colloidal particles. The growth of crystals from solution or from a molten mass is frequently influenced by the presence of other substances in solution; this rate of growth of the crystals in different directions determines their shape.

Adsorption plays a very important part in the agglutination of bacteria, and in the neutralization of a toxin by an anti-toxin. In the field of public health we find adsorption of importance. Aluminium hydroxide and ferric hydroxide, which are present in the soil, are very pronounced adsorbents, and filtration through soil is therefore a very efficient means of freeing sewage and other waste water from colloidal organic particles. This is also of importance to agriculture as the means whereby the soil is able to retain solvents from solutions which percolate through it.

S. Taylor, 1924); A. Findlay, *Physical Chemistry for Students of Medicine* (1924). Burrell's, *The Recovery of Gasoline from Natural Gas* (1925). (W. Ts.)

ADULIS (mod. *Zula*).—An ancient city of Eritrea. According to Pliny, it was founded by slaves who had fled from their Egyptian masters. Excavations have led to the discovery of a considerable amount of prehistoric pottery, and of various buildings, including an altar of the Sun and two Christian churches. The principal periods of its prosperity were the Ptolemaic, Graeco-Roman and Christian. The city, as far as can be ascertained, had neither fortifications nor walls.

See R. Paribeni in *Monumenti dei Lincei*, xviii. (1907) 437 sqq.

ADULLAM, a Canaanite city (Gen. xxxviii. 2), fortified by Rehoboam (2 Chron. xi. 7), and still a place of importance at the time of the Maccabees (2 Mac. xii. 38). Its chief interest lies in its connection with David who took refuge in its stronghold ("Cave" is a scribal error) on two occasions (1 Sam. xxii. 1; 2 Sam. v. 17). A site on the eastern edge of the Shephelah in the neighbourhood of Socoh (Shuweikah) seems to be indicated. Conjectural identifications are (1) Khareitun, south-east of Bethlehem, which has a large cave but nothing else to commend it. (2) Deir ed-Dibban, some 6m. east of Shuweikah, where there are caves and (3) Aid el-Ma', south of Shuweikah and at no great distance from it. The last identification is the one most favoured. The name, which appears to represent an Arabic reconstruction of Adullam, the position and the physical characteristics of the site support it. In modern political history the term "Cave of Adullam" was applied by John Bright to certain Liberals who seceded from their party to oppose the Reform Bill of 1866. But the expression had been used earlier by President Lincoln (1864). From the same usage is derived the shorter political term "Cave" for any body of men who secede from their party on some special subject.

ADULT EDUCATION, a phrase originally meaning education of adults who have not been properly educated as children. As the educational system improved, the need for such education diminished, but as democratic government developed, it brought with it the need, felt by everyone, for education in citizenship. Adult education in this sense has been described as "an inseparable aspect of citizenship" and the new movement, which dates from the beginning of this century, has extended to democratic countries all over the world, including such countries as Germany and the United States. Because these countries had early possessed a comprehensive system of elementary and secondary education, they have not felt the need for adult education in its original sense. (See Adult Education in the United States, page 185.) It is often also distinguished as non-vocational adult education from the vocational education now given to adults in technical and commercial colleges in many parts of the country.

The new movement has taken many forms and is carried on

by many different organizations which held ideals that were at the same time high and practical. Thus in England the Workers' Educational Association, founded by Albert Mansbridge in 1903, originally aimed at bringing together working-class organizations to provide for an education, designed not to take men out of their class or trade, but to equip them, whatever their occupation in life should be, for the work of citizenship. It was to be a highway and not a ladder. The education it desired to bring into being was to be broad, impartial and scholarly, was to aim at a higher university standard and was to enlist the aid of the universities and of public authorities.

The universities were asked to help in maintaining the standard of education, but the choice of subjects and of tutors was to be with the students. It was recognized that adult students bring an experience of life and an understanding of practical problems which are as important a contribution as the more theoretical knowledge of the teachers, and that adult education, therefore, requires a technique and organization in which both students and university trained teachers have their parts to play.

Tutorial Classes.—In 1907 the University of Oxford organized the first tutorial class, the characteristic educational instrument of the new movement. These classes were small, between 20 and 30 persons, meeting once a week in the winter over a period of three years. Each class period consisted of an hour's lecture and an hour's discussion, the students undertaking from the start to attend for the full period of three years and to do written work. The classes were under the control of a joint committee consisting of equal numbers of representatives of the university and of working-class organizations. The quality of work done in these classes was often of a good university standard. All the other universities of England and Wales followed the example of the University of Oxford, and in 1925 there were over 500 tutorial classes with 12,000 students, while the number of affiliated bodies was 2,500 and of independent members 23,000. The Board of Education has supported this work from the beginning and through its inspectors and the reports of its advisory adult education committee done much to further the standard of the teaching given. Most local education authorities now give some support to adult education by grants either to tutorial classes or to the more elementary one-year classes and terminal courses which have greatly increased in numbers.

The total amount of education of this kind given in democratic countries is very considerable and is rapidly increasing. The movement is still young and its future organization is still uncertain. Its great strength in the past was that it has been run by voluntary associations and has in a real sense been a university controlled in the main by its students. It suffers, however, from the weakness of administration and the fluctuating enthusiasm characteristic of all voluntary organizations. Its success in the future will depend on how far it can be connected more closely with public educational institutions on the one hand and organized labour on the other, without losing its voluntary character. The British Institute of Adult Education attempts to survey and co-ordinate by the publication of its journal and other literature, and by the holding of conferences, the work of the various organizations in the country which are concerned with adult education. The World Association of Adult Education is working to spread knowledge of adult education in all parts of the world.

See *Final Report of the Adult Education Committee* (Cmd. 321, 1919) and *Journal of the British Institute*. (A. D. L.)

UNITED STATES

In the United States the term adult education is used to denote an educational movement for men and women, young and old, who no longer are in contact with formalized education and whose primary interest lies in a vocation but who possess a secondary interest in their own educational improvement as a sustained and continuing process. It is sometimes called "continuing education." It interprets graduation from any sort of schooling as a commencement of educational opportunity extending throughout life.

While the movement was not recognized in the United States under the name "adult education" until 1924, its roots were already deeply imbedded in American life. The New England town meeting of the 17th century formed the initial adult education venture of record in the English colonies of North America. It was a logical next step to the formation of the first lyceum in Massachusetts in 1826, a voluntary association of farmers and mechanics "for the purpose of self-culture, community instruction and mutual discussion of common public interests." The town lyceums made rapid growth and in 1839 more than 3,000 were in existence. They assumed an educational leadership with the years, Emerson, Thoreau, Lowell and Holmes among others lending them prestige. It was the example of the lyceum which led Bishop John H. Vincent and his colleagues in 1874 to expand a Sunday school association into a general adult education venture. The Chautauqua Institution (*see* LYCEUMS and CHAUTAUQUAS) resulted and in its train numerous imitators, later to be served by the commercial Chautauqua and lyceum circuits. The last quarter of the 19th century saw the beginnings of the university extension movement and with the 20th century impetus to popular education was given through Andrew Carnegie's large benefactions to public libraries. Meanwhile the tax-supported school system, as the compulsory school age was pushed upward, had instituted a series of vocational extensions, soon accompanied by such non-vocational enterprises for adults as the voluntary evening high school.

The increase in public estimation of these agencies gave rise to many other forms of educational activity for adults. Most of them were based on the American tradition of education at cost, less than cost or no cost to the student. In addition there were devised, to meet the recognized educational needs of large numbers of people, certain commercial organizations known as private correspondence schools (*see* CORRESPONDENCE SCHOOLS) operated for profit under modern salesmanship methods. Almost wholly vocational and technical in nature, these courses attracted such numbers that in 1927 the current enrolment was estimated at more than 2,000,000 persons who were annually expending \$70,000,000 for the instruction offered.

An inquiry into adult education needs and possibilities in England and Scotland, made as a part of the British ministry of reconstruction report of 1919, had resulted in the phenomenal growth of adult classes in those countries. Increasing recognition of the British movement and observance of a considerable American interest in various forms of continuing education led to an inquiry into American conditions, instituted in 1924 by the Carnegie Corporation of New York. Five volumes constituting reports on as many broad phases of the general subject were published, a series of regional and national conferences of teachers and leaders of adults was held and, in March, 1926, there was formed the American Association for Adult Education with headquarters in New York. It serves as a national clearing house for information, sponsors and initiates researches and studies, and supervises and conducts experiments and demonstrations in co-operation with local and national agencies.

Urban and Rural Community Organization for Adult Education.—The initial attempt in the United States to organize an entire community's educational facilities with special reference to the adult and his needs was made in Cleveland in 1924. The Cleveland Conference for Educational Co-operation resulted and later a complementary body, the Adult Education Association of Cleveland. In 1925, Buffalo, organized similarly, conducted a self-survey under the auspices of a co-operative group known as the Buffalo Educational council. The survey has since been published and the recommendations of the council are rapidly becoming effective. The Cleveland and Buffalo examples have brought together like groups in Chicago, Detroit, St. Louis and Brooklyn. Plans for organization have been made in eight other cities. In addition, Dallas, Texas, in its Civic Federation and Institute for social education, founded in 1920, furnishes perhaps the best example in the country of a private educational venture for adults. Representatives of the various community enterprises have formed a national community conference which has affiliated

itself with the National Community Foundation. The latter organization is conducting, on an experimental basis, community organization activities and educational programmes in 60 small cities and towns of the Middle Atlantic States. It co-operates with its related organization, the Swarthmore Chautauqua. Michigan state college is experimenting with continuing education for rural areas in two Michigan counties selected for the purpose. A preliminary survey has been made and responsibility has been assumed by local groups. The California State board of education has likewise initiated a rural county demonstration. A privately supported small town circuit in western New York has been formed, initiating programmes in 16 centres.

Tax-supported Adult Education.—Approximately 100,000 men and women are enrolled in public evening schools (*see* CONTINUATION SCHOOLS) annually. They are almost exclusively in urban centres of 25,000 population or more. The work offered is either the same as the day school, designed to meet the needs of those who have had to leave school for economic reasons, or technical courses for vocational preparation, or classes for immigrants desiring to learn English. The last group has diminished rapidly since the revision of the immigration laws, although evidence is at hand that the need for such instruction still is large. The continuation school (*see* CONTINUATION SCHOOLS) is newly established and is found in only half the States of the Union and there only in the larger urban communities. It requires from four to 18 hours of student school time each week. The co-operative school, originating at the University of Cincinnati, is still in an experimental stage. It provides for equal division of time between class-room and work in a factory. The usual practice is to alternate weeks. Antioch college, O., is wholly given over to the industrial co-operative idea.

Private Technical, Commercial and Correspondence Schools.—Thousands of business schools (*see* COMMERCIAL EDUCATION), trade schools (*see* TECHNICAL EDUCATION; INDUSTRIAL SCHOOL), and technical institutes, conducted for profit and in a relatively small number of cases, philanthropically endowed, operate in cities of all sizes throughout the country. They vary widely in efficiency and in repute. The schools of this type which utilize the correspondence method of instruction have reached large proportions in the United States. Of the 1,500,000 new students enrolled each year, 95% wish to obtain vocational training and pay from \$10 to \$280 for each course, the average payment being about \$40. Extensive advertising methods are employed, from 30% to 80% of all tuition fees received being devoted to course salesmanship. Efforts are being made by the Federal trade commission, by the Better Business bureau of the National advertising clubs and by the National Home Study council, an association of correspondence schools, to improve business ethics and to create instructional standards.

Schools Operated by Religious Organizations.—Each of the large associations originally organized for religious and social purposes maintains an educational activity as an auxiliary phase. The Young Men's Christian Association (*q.v.*) enrolls about 90,000 young men, mostly in evening classes which are chiefly of a vocational nature but which recently have shown a trend toward the non-vocational. The Young Women's Christian Association (*q.v.*) has an even more widespread educational programme, though of a much more informal nature than that of the Young Men's Christian Association. Its emphasis is definitely on the side of cultural studies. The Knights of Columbus (*q.v.*) and Young Men's and Young Women's Hebrew associations repeat the patterns of the other associations on a smaller scale.

Corporation Schools.—Education for workers is of two general types in the United States: that provided by the workers themselves and that provided by the employers. In the latter group fall some interesting experiments in education for the job-vocational education designed for immediate practical use in the industry which offers it. The larger corporations such as the Standard Oil Company, The Westinghouse Company, the telephone and allied interests, and to a lesser degree the automobile manufacturers, have educational departments which take employes from apprentice courses to the highest technical branches.

Workers' Education.—Although sporadic efforts had been made during the preceding quarter century, it was not until after the World War that an organized educational movement of wage-earners assumed sizable proportions in the United States. In 1921 a group of trade unionists and teachers in New York formed the Workers' Education bureau of America as a national organization to serve as a clearing house for information and to establish study classes. The bureau has since become the agency through which the American Federation of Labor carries on its entire adult education programme for its membership. It has not only increased the number of workers' classes, but has published text-books, syllabi and study outlines. Of the dozen or so labour colleges scattered through the country, the residential Brookwood Labor college at Katonah, N.Y., is the best known. It has a two-year course and also conducts special summer institutes. The International Ladies' Garment Workers' union has the most highly developed educational programme among national unions, although those of the United Mine Workers in Illinois and Pennsylvania are worthy of note. In California, the State Federation of Labor and the University of California Extension Division have embarked upon a joint programme for workers.

Special Summer Schools.—At Bryn Mawr college, a summer session for women workers in industry is held annually for 100 women workers, equally divided between unionized and non-unionized workers. The Bryn Mawr plan has been successfully adopted at the University of Wisconsin, Barnard college of Columbia university, New York, and at Sweetbriar college, Virginia. The National League of Girls' clubs holds an annual summer session on Long Island for mill girls, stenographers and other industrial workers, initially trained in the league's winter classes in New England and Middle Atlantic States. These summer schools are not to be confused with those conducted in great numbers by the universities and colleges throughout the country (*see* SUMMER SCHOOLS) which, while open to adults generally, are chiefly attended by teachers and college students. The California State board of education in 1927 initiated a series of special summer schools of adult education to be held annually. The first session was held at Mills college, Oakland, with an attendance of 250. The Chautauqua Institution of New York conducts a two months' summer session annually attended by about 12,000 people. This course is comparable with a university summer session. In addition winter reading courses are attended by 10,000 persons.

University Extension and Adult Education.—The total enrolment of university extension students in the United States, exclusive of agricultural extension (*see* UNIVERSITY EXTENSION and AGRICULTURAL EDUCATION) may conservatively be estimated at 250,000. The university extension movement (*see* UNIVERSITY EXTENSION), through lectures, visual education media, correspondence courses, exhibits, discussion groups, reading circles, etc., easily reaches five times that number. If the 5,000,000 members of farm families reached by the State agricultural colleges in co-operation with the Federal department of agriculture be added to the general extension total, it will be seen that university and college extension is the most important factor numerically in adult education in the United States.

Libraries and Museums.—Through the activities of the board on the library and adult education of the American Library Association, the 4,000 communities in the United States which have their own public library facilities, together with a number of State and regional organizations, have been acquainted with a new conception of the library as a dynamic agency of education. Many of the larger libraries have instituted readers' advisory services providing individual attention for every serious reader, including the preparation of special reading courses. This association has published a "Reading with a Purpose Series" consisting of more than 40 pamphlets, each of which is a short introduction to a given subject together with a list of half a dozen recommended books in the field. Hundreds of thousands of copies of these pamphlets have been sold and distributed. (*See* LIBRARIES and SCHOOL LIBRARIES.) By means of lectures, gallery talks, guidance for visitors, publications for the layman, loan collections, travelling exhibits, consultation hours for students and manufacturers, and

formal classes, a great educational work has also been done by the museums.

Chautauquas and Lyceums.—The modern Chautauqua and lyceum serve towns of less than 2,500 population almost exclusively. With the exception of one circuit, they are conducted for profit. The competition deriving from the radio, motion pictures and cheap transportation has resulted in large financial loss to the Chautauqua and lyceum operators of late years and it is questionable whether this form of combination lecture and entertainment bureau will persist in America. The commercial Chautauquas are not to be confused with the Chautauqua Institution of New York.

Women's Clubs, Parent Groups and Forums.—Three million women in the United States belong to women's clubs, in towns and cities of all sizes. Study materials are prepared by national and State offices which form the bases of educational programmes throughout the year. With the public school as the basic unit, hundreds of thousands of parents, chiefly mothers, are united in parent-teacher associations, child study (*see CHILD STUDY ASSOCIATIONS*), child welfare groups, etc. They are served by several national organizations. Each group is engaged upon an educational programme. Certain of the large State universities, notably Iowa, Minnesota and California, have recently assumed responsibilities in relation to the parental education programmes within their respective areas. Varying greatly in accordance with the communities which they serve, open forums flourish in many parts of the country. They are purely individualistic and autonomous; half of them are conducted by Protestant or Jewish churches.

Individual Enterprises.—Certain individual enterprises reflect the best which the nation has to offer in adult educational thought. Among these should be cited the People's Institute of New York, founded in 1897 as a forum for public discussion. Courses of instruction of a high standard and individual lectures are offered. In its school, the institute conducts experimental classes for adults in various parts of New York city. Similarly, the New School for Social Research of New York city may be considered an adult education enterprise. There are others of less note, including at least three Danish folk school experiments which have not yet demonstrated their adaptability to American life.

ADULTERATION, the act of debasing a commercial commodity with the object of passing it off as or under the name of a pure or genuine commodity for illegitimate profit, or the substitution of an inferior article for a superior one, to the detriment of the purchaser. Although the term is mainly used in connection with the falsification of articles of food, drink or drugs, and is so dealt with in this article, the practice of adulteration extends to almost all manufactured products and even to unmanufactured natural substances. In its crudest forms, as old as commerce itself, it has progressed with the growth of knowledge and of science, and is, in its most modern developments, almost a branch—and that not the least vigorous one—of applied science. From the mere concealment of a piece of metal or a stone in a loaf of bread or in a lump of butter, a bullet in a musk bag or in a piece of opium, it has developed into the use of aniline dyes, of anti-septic chemicals, of synthetic sweetening agents in foods, the manufacture of butter from coco-nuts, of lard from cotton-seed and of pepper from olive stones. Its growth and development has necessitated the employment of multitudes of scientific officers charged with its detection and the passing of numerous laws for its repression and punishment. While for all common forms of fraud the common law is in most cases considered strong enough, special laws against the adulteration of food have been found

necessary in all civilized countries. A vigorous branch of chemical literature deals with it; there exist scientific societies specially devoted to its study; laboratories are maintained by governments with staffs of highly trained chemists for its detection; and yet it not only develops and flourishes but becomes more general, if less virulent and dangerous to health.

There are numerous references to adulteration in the classics. Both in Rome and in Athens wine was often adulterated with colours and flavouring agents, and inspectors were charged with looking after it.

In England, so far back as the reign of John (1203), a proclamation was made throughout the kingdom as regards bread; and in the following reign the statute (51 Hen. III. Stat. 6) entitled "the pillory and tumbrel" was framed for the express purpose of protecting the public from the dishonest dealings of bakers, vintners, brewers, butchers and others. This statute is the first in which the adulteration of human food is specially noticed and prohibited; it seems to have been enforced with more or less rigour until 1709, when it was repealed.

Similar records have come down from the continental European countries. In 1390 an Augsburg wine-seller was sentenced to be led out of the city with his hands bound and a rope round his neck; in 1400 two others were branded and otherwise severely punished; in 1435 "were the taverner Christian Corper and his wife put in a cask in which he sold false wine, and then exposed in the pillory. The punishment was adjudged because they had roasted pears and put them into new sour wine, in order to sweeten the wine. Some pears were hung round their necks like unto a Paternoster." In Biebrich, on the Rhine, in 1482, a wine-falsifier was condemned to drink six quarts of his own wine; from this he died. In Frankfurt, casks in which false wine had been found were placed with a red flag on the knacker's cart, "the jailer marched before, the rabble after, and when they came to the river they broke the casks and tumbled the stuff into the stream." In France successive *ordonnances* from 1330 to 1672 forbade the mixing of two wines together under the penalty of a fine and the confiscation of the wine.

MODERN BRITISH LEGISLATION

In modern times the English parliament has dealt frequently with the subject of food adulteration. In 1725 and 1730 acts were passed prescribing a penalty for "sophisticating" tea; in 1718 adulteration of coffee and in 1803 of cocoa were the subjects of legislation; in 1816 the addition of extraneous colouring matters to beer and porter was prohibited. It was only in 1847 that brewers were allowed to make for their own use from sugar a liquor for darkening the colour of worts or beer and to use it in brewing.

All the laws hitherto referred to were mainly passed in the interest of the inland revenue, and their execution was left entirely in the hands of the revenue officers. About the middle of the 19th century statements were from time to time published concerning the food supply of the nation and roused the attention of the general public. In 1850 Dr. Arthur H. Hassall, had the happy idea of looking at ground coffee through the microscope. Eminent chemists had previously found great difficulty in establishing any satisfactory chemical distinction between coffee, chicory and other adulterants of coffee; the microscope immediately showed the structural difference of the particles, however small. Hassall was in consequence commissioned by Thomas Wakley (1795–1862), the owner of the *Lancet*, to extend his examination to other articles of food, and for a period of nearly four years reports of the *Lancet Analytical Sanitary Commission* were regularly published, the names and addresses of hundreds of manufacturers and tradesmen selling adulterated articles being fearlessly given. The responsibility incurred was immense, but the assertions of the journal were so well founded upon fact that they were universally accepted as accurately representing the appalling state of the food supply. As instances may be cited, that of 34 samples of coffee only three were pure, chicory being present in 31, roasted corn in 12, beans and potato-flour each in one; of 34 samples of chicory, 14 were adulterated with corn, beans or

acorns; of 49 samples of bread, every one contained alum; of 56 samples of cocoa, only eight were pure; of 26 milks, 14 were adulterated; of 28 cayenne peppers, only four were genuine, 13 containing red-lead and one vermilion; of upwards of 100 samples of coloured sugar-confectionery, 59 contained chromate of lead, 11 gamboge, 12 red-lead, six vermilion, nine arsenite of copper, and four white-lead.

First Measures.—In consequence of the *Lancet's* disclosures a parliamentary committee was appointed in 1855, the labours of which resulted in 1860 in the Adulteration of Food and Drink Act, the first act that dealt generally with the adulteration of food. As the act, however, left it optional to the district authorities to appoint analysts or not, and did not provide for the appointment of any officer upon whom should rest the duty of obtaining samples or of prosecuting offenders, it virtually remained a dead letter till 1872, when the Adulteration of Food and Drugs Act came into force, prescribing a penalty not exceeding £50 for the sale of injurious food and, for a second offence, imprisonment for six months with hard labour. Inspectors were empowered to make purchases of samples to be submitted for analysis, but appointment of analysts was still left optional. The definition of an adulterated article given in that act was essentially that still accepted at the present time, namely, "any article of food or drink or any drug mixed with any other substances, with intent fraudulently to increase its weight or bulk, without declaration of such admixture to any purchaser thereof before delivering the same." The adoption of the act was sporadic, and, outside London and a few large towns, the number of proceedings against offenders remained exceedingly small. Nevertheless complaints soon arose that it inflicted considerable injury and imposed heavy and undeserved penalties upon some respectable tradesmen, mainly owing to the "want of a clear understanding of what does and does not constitute adulteration," and in some cases to conflicting decisions and the inexperience of analysts.

Again a parliamentary committee was appointed which took a mass of evidence, the outcome of its enquiries being the Sale of Food and Drugs Act 1875, which is in force at the present day, subject to amendments and additions made at later dates. This act avoided the term "adulteration" altogether and endeavoured to give a clearer description of punishable offences. Also it made the appointment of analysts compulsory upon the City of London, the vestries, county quarter sessions and town councils or boroughs having a separate police establishment.

Endless disputes unavoidably arose, friction with manufacturers and traders, unfortunately also with the referees at the inland revenue, who for many years were altogether out of touch with the analysts. Conflicting decisions come to by various benches of magistrates upon similar cases, allowing of the legal sale of an article in one district which in another had been declared illegal, rendered the position of merchants often unsatisfactory. It was not recognized by parliament until almost a quarter of a century had elapsed that it was not enough to compel local authorities to get samples analysed, but that it was also the duty of parliament to lay down specific and clear instructions that might enable the officers to do their work. This has only been very partially done even at the present time.

As many thousands of samples were annually submitted by inspectors under the act to the analysts who had been appointed in 237 boroughs and districts, a very large number of cases led to disputes of law or fact, about 70 high court cases being decided within 18 years of the passing of the act. While these cases related to a variety of different articles and conditions, dairy produce—namely, milk and butter—led to the greatest amount of litigation. It may seem to be a simple matter to ascertain whether a vendor of milk supplies his customer with milk of the "nature, substance and quality demanded," but milk is subject, naturally, to great variations in composition owing to a large number of circumstances.

Not many years after the passing of the Food Act of 1875 the sale of butter substitutes assumed very large proportions, and so seriously prejudiced dairy-farmers that, as regards these, an act was passed which was not exactly an amendment of the Sale of

Food and Drugs Act, although it embodied a good many provisions of that act. It was called the Margarine Act 1887. It provided that every package of articles made in imitation of butter should be labelled "margarine" in letters $1\frac{1}{2}$ inches square. The Margarine Act is the first statute that makes reference to and sanctions the use of preservatives, concerning which something will have to be said farther on.

Administrative Difficulties.—In the course of 20 years of administration of the Food Acts so many difficulties had arisen on various points, that in 1894 a select committee was appointed to enquire into the working of the various acts and to report whether any, and if so what, amendments were desirable. During three sessions the committee sat and took voluminous evidence. They reported that where the acts had been well administered they had been most beneficial in diminishing adulteration offences, but that wide local differences in the administration of the acts existed, and that in many parts of the country the local authorities had failed to exercise their powers. The important question of food standards was considered at great length. The absence of legal standards or definitions of articles of food had occasioned great difficulty in numerous cases, but as no authority was provided by the existing acts that might fix such standards they recommended the formation of a scientific authority or court of reference composed of representatives of the laboratory of the Inland Revenue, of the Local Government Board, the Board of Agriculture, the General Medical Council, the Institute of Chemistry, the Pharmaceutical Society, of other scientific men, and of the trading and manufacturing community, who should have the duty of fixing standards of quality and purity of food to be confirmed by a secretary of state.

The committee's deliberations and recommendations resulted in the Sale of Food and Drugs Act 1899. This unfortunately was not a comprehensive act superseding the previous acts, but was an additional and amending one, so that at the present time four food acts run parallel and are together in force, rendering the subject from a legal point of view one of extreme complexity.

The act of 1899 embodies, with one exception, the most important recommendations of the Food Products Committee, the exception being the omission to institute a board of reference that might deal with difficulties as they arose, guide analysts and public authorities in fixing limits for articles other than milk and butter, and take up the important questions of preservatives and colouring matters and such like. An occurrence which almost immediately followed the passing of the act showed in the strongest manner the necessity of such guiding board—namely, the outbreak of arsenical poisoning in the Midlands in the latter part of 1900.

In the month of June 1900 there occurred, mainly in the Midlands but also in other parts of England and Wales, an outbreak of an illness variously described as "alcoholism," "peripheral neuritis" or "multiple neuritis." This affected about 6,000 persons and resulted in about 70 deaths. It was soon ascertained that the sufferers were all beer drinkers, and several of them were employees of a local brewery, the majority of whom had suffered for some months past. Although suspicion fell early upon beer, some considerable time elapsed before Dr. E. S. Reynolds of Manchester discovered arsenic in dangerous proportions in the beer. Steps were immediately taken by brewers and sanitary authorities to ensure that this arsenical beer was withdrawn from sale, and, as a result, the epidemic came speedily to an end. In all instances where this epidemic of sickness had been traced to particular breweries, the latter had been users of brewing sugars—glucose and invert sugar—supplied by a single firm. The quantity of arsenic detected in specimens of these brewing sugars was in some cases very large, amounting to upward of four grains per pound. The implicated brewing sugars were found to have become contaminated by arsenic in course of their manufacture through the use of sulphuric acid made from highly arsenical iron pyrites. Strictly speaking, arsenical poisoning does not belong to the subject of adulteration. It is not due to wilfulness but to stupidity, but it affords a lesson which cannot be taken too much to heart, that mankind, by relying too much upon "science" in feeding, is

on a path that is fraught with considerable danger. For there is hardly a chemical substance which has, directly or indirectly, come into contact with sulphuric acid that is not at times arsenical. Recently, arsenical poisoning has been reported from consumption of apples that had received a "summer spray" against insect pests.

To safeguard consumers, as far as practicable, the royal commission made important recommendations concerning amendments of the Food Acts. Pending the establishment of official standards in respect of arsenic under the Food Acts, they were of opinion that penalties should be imposed upon any vendor of beer or any other liquid food, or of any liquor entering into the composition of food, if that liquid be shown by adequate test to contain one-hundredth of a grain or more of arsenic in the gallon; and with regard to solid food, no matter whether it be consumed habitually in large or small quantities, or whether it be taken by itself (like golden syrup), or mixed with water or other substances (like chicory or yeast extract)—if the substance contain one-hundredth of a grain of arsenic or more to the pound. The board of reference, most urgently needed for the protection of the public and for the guidance of manufacturers and officers, has yet to be created.

PRESERVATIVES IN FOOD

While from time immemorial certain articles of food have been preserved by salting, smoking, drying, the addition of sugar or of saltpetre, during the last quarter of the 19th century the use of chemicals acting as antiseptics or preservatives extended enormously. Refrigeration and cold-storage have enabled meat and other highly perishable foods to be imported, but it is necessary to prevent decomposition prior to such goods coming into cold store. This difficulty—apart from the use of preservatives—can only be overcome by improvement in transport facilities or constriction of the area from which supplies can be obtained. The legality or otherwise of the use of chemical preservatives hinges upon the difficult question of their innocuousness. Hence in 1899 a committee of the Local Government Board was appointed to inquire into the use of preservatives and colouring matters in food. In 1901 this committee recommended that the use of formaldehyde or formalin, or preparations thereof, in food or drinks, be absolutely prohibited, and that salicylic acid be not used in a greater proportion than one grain per pint in liquid food and one grain per pound in solid food, its presence in all cases to be declared; that the use of any preservatives or colouring matter whatever in milk offered for sale in the United Kingdom be constituted an offence under the Sale of Food and Drugs Act; that the only preservative which it shall be lawful to use in cream be boric acid, or mixtures of boric acid and borax, and in amount not exceeding 0.25% expressed as boric acid, the amount of such preservative to be notified by a label upon the vessel; that the only preservative permitted to be used in butter and margarine be boric acid, or mixtures of boric acid and borax, to be used in proportions not exceeding 0.5% expressed as boric acid; that in the case of all dietetic preparations intended for the use of invalids or infants, chemical preservatives of all kinds be prohibited.

Boric Acid.—As the most commonly used chemical preservative is boric acid, free or in the form of borax, which is extensively employed in butter, cream, ham, sausages, potted meats, cured fish, and sometimes in jams and preserved fruit, the arguments for and against its employment deserve more detailed attention. It cannot be looked upon in the light of common adulteration because, in any case, the quantity used is but an inconsiderable fraction, and the cost of it is generally greater than that of the food itself. It is not used to hide any traces of decomposition that may have taken place or to efface its effects. It enables food to be kept from decomposition, but it also lessens the need for cleanliness and encourages neglect and slovenliness in factories. It has little taste and hence cannot be perceived by the consumer or avoided by him should he desire to do so. Its preservative action is very slight in comparison with most other preservatives; its potential injuriousness to man must be proportionately small. It is practically without interference upon salivary, peptic or tryptic

digestion, unless given in large quantities. An exhaustive investigation was carried out by Dr. H. W. Wiley, chief chemist to the United States Department of Agriculture. Dr. Wiley concludes his report: "It appears, therefore, that both boric acid and borax, when continuously administered in small doses for a long period or when given in large quantities for a short period, create disturbance of appetite, of digestion and of health." This report was adversely criticized, but on the whole the balance of evidence seems to be that while no acute injury is likely to result from boron compounds in food, they are liable to produce slighter digestive interferences. Its use as a preservative for food was prohibited in England in 1925.

Formaldehyde.—Other chemical substances used to preserve food may be treated more shortly. Formaldehyde, coming into commerce in the form of a 40% solution under the name of formalin, was for a time largely used in milk. It is now generally recognized as admirably adapted for disinfecting a sick-room, but unsuitable for food preservation.

Salicylic Acid.—Salicylic acid or orthohydroxybenzoic acid is either obtained from oil of winter-green or is made synthetically. When pure, salicylic acid employed as a food preservative has never produced decided injurious effects, although it is a powerful drug in larger doses and requires careful administration, especially as about 60% of the persons to whom it is administered show symptoms known as "salicylism," namely, deafness, headache, delirium, vomiting, sometimes haemorrhage or heart-failure. When present in proportion of 1 to 1,000 it inhibits the growth of moulds and yeasts. In jams two grains per pound and in beverages seven grains to a gallon are considered by manufacturers to be sufficient for preservative purposes. It is used mainly in articles of food or drink containing sugar. Its use in butter, potted meat, milk or cream, is now quite exceptional. To some extent benzoic acid and benzoates have taken the place of salicylic acid and salicylates, partly because salicylic acid can readily be detected analytically, while benzoic acid is not quite easily discoverable.

Sulphurous Acid.—For the preservation of meat and beer, lime juice and dried fruit, sulphur dioxide (sulphurous acid) and some of the sulphites have long been employed. About 1 part in 4,000 or 5,000 of beer is the usual amount. By the Public Health (Preservatives, etc., in Food) Regulations, 1925, in England, the amount of sulphur dioxide (by weight) in beer must not exceed 70 parts per million. While in larger quantities the sulphites produce nephritis, there is no evidence that they have ever caused injurious effects in alcoholic liquors.

Other Preservatives.—Sodium fluoride, a salt possessing powerfully antiseptic properties but interfering with salivary and peptic digestion, has been found in butter, imported mainly from Brittany, in quantities quite inadmissible in food under any circumstances. A few other chemical preservatives are occasionally used. Hydrogen peroxide has been found effective in milk sterilization, and if the substance is pure no serious objection can be raised against it. Saccharine and other artificial sweetening agents having antiseptic properties are taking the place of sugar in beverages like ginger-beer and lemonade, but the substitution of a trace of a substance that provides sweetness without at the same time giving the substance and food value of sugar is strongly to be deprecated.

The employment of chemical preservative matters in articles intended for human consumption threatens to become a grave danger to health or well-being. Each dealer in food contributes but a little; each one claims that his particular article of food cannot be brought into commerce without a preservative, and each condemns the use of these substances by others. There is doubtless something to be said for the practice, but infinitely more against it. It cheapens food by allowing its collection in districts far away, but the chief gainer is not the public as a whole but the manufacturer and the wholesale merchant. It is clearly the duty of the state to see that the evil is checked.

COLOURING MATTER

A similar criticism applies to the continually extending use of colouring matter in food. Civilized man requires his food not

only to be healthy and tasty, but also attractive in appearance.

Vegetables.—This is difficult to ensure, for the various colouring matters which are naturally present in meat and fish, in fruit, legumes and green vegetables are of a delicate and changeable nature and easily affected or destroyed by cooking. The manufacturer who used to put up "green" peas in pots or tins for sale produced the effect by the wilful addition of a substance known to be injurious to health, namely, sulphate of copper. The copper combines with the chlorophyll, forming copper phyllocyanate, which, by reason of its insolubility in the gastric juice, is comparatively innocuous. Preserved peas and beans have been for so many years "coppered" in this manner that it is difficult to induce the public to accept these vegetables when possessed of their natural colour only. The use of copper compounds as colouring matters was prohibited in England in 1925.

Milk.—Milk is naturally almost white with a tint of cream colour. When adulterated with water this tint changes to a bluish one. To hide this tell-tale of a fraud a yellow colouring matter used to be added by London milkmen. Very gradually this practice, which had its origin in fraud, extended to all milk sold in London. The consumer, mis-educated into believing milk to be yellow, required it to be so. Large dairy companies endeavoured to wean the public of its error, without success. In England the addition of colouring matter to milk was prohibited in 1925. From milk the practice extended to butter; natural butter is sometimes yellowish, mostly a faint fawn, and sometimes almost white. In agricultural districts this is well known and taken as a matter of course. In big towns, where the connection of butter and the cow is not well known, the consumer requires butter to be of that colour which he imagines to be butter-colour. Anatto, turmeric, carrot-juice used formerly to be employed for colouring milk, butter and cheese, but of late certain aniline dyes, mostly quite as harmless physiologically as the vegetable dyes just mentioned, are largely being used. In England, the addition of picric acid, dinitrocresol, Martius or naphthol yellow, aurantia and aurine (rosolic acid) is prohibited.

Sugars and Jams.—The same aniline dyes are also employed in the manufacture of an imitation Demerara sugar from white beet-sugar crystals. Aniline dyes are very frequently used by jam-makers; the natural colour of the fruit is apt to suffer in the boiling-pan, and unripe, discoloured or unsound fruit can be made brilliant and enticing by dye. The brilliant colours of cheap sugar confectionery are almost invariably produced by artificial tar-colours. Most members of this class of colouring matters are quite harmless, especially in the small quantities that are required for colouring, but there are a few exceptions, picric acid, dinitrocresol, Martius yellow, Bismarck brown and one of the tropaeolins being distinctly poisonous.

On the whole, the employment of powerful aniline dyes is an advance as compared with the use of the vicious and often highly poisonous mineral colours which Hassall met with so frequently in the middle of the 19th century. Mineral colours, with very few exceptions, are no longer used in food. Oxide of iron or ochre is still very often found in potted meats, fish sauces and chocolates; dioxide of manganese is admixed with cheap chocolates. All lump sugar of commerce is dyed. Naturally it has a yellow tint. Ultramarine is added to it and counteracts the yellowness. In the same way our linen is naturally yellow and only made to look white by the use of the blue-bag.

Difficult Cases.—The same idea underlies both practices, and indeed the use of all colouring matters in manufactured articles, namely, to make them look better than they would otherwise. Within bounds, this is a reasonable and laudable desire, but it also covers many sins—poor materials, bad workmanship, faulty manufacturing and often fraud. Like sugar, flour and rice are sometimes blued to make them look white. All vinegar, most beers, all stout, are artificially coloured with burnt sugar or caramel. The line dividing the legitimate and laudable from the fraudulent and punishable is so thin and difficult to draw that neither the law nor its officers have ventured to draw it, and yet it is a matter which urgently requires regulation at the hands of the State. Practices which, when new, admit of regulation are almost ineradicable

when they have become old and possessed of "vested rights." Recognizing this, the departmental committee, like the royal commission on arsenical poisons, recommended that "means be provided, either by the establishment of a separate court of reference, or by the imposition of more direct obligation on the Local Government Board, to exercise supervision over the use of preservatives and colouring matters in foods and to prepare schedules of such as may be considered inimical to the public health."

Metallic Impurities.—In close connection with this subject is the occasional occurrence of injurious metallic impurities in food-materials. Tin chloride is used in the West Indies to produce the yellow colour of Demerara sugar. The old processes of sugar-boiling left some of the brown syrup attached to the crystals, giving them both their colour and their delicious aroma; with the introduction of modern processes affording a much greater yield of highly refined sugar white sugar only was the result. The consumer, accustomed to yellow sugar, had the colour artificially supplied by the action of the tin compound upon the sugar. Nowadays all Demerara sugar, with the exception of that portion that is dyed with aniline dye, has had its colour artificially given it and consequently contains strong traces of tin.

Soda-water, lemonade and other artificial aerated liquors are liable to tin or lead contamination, the former proceeding from the tin pipes and vessels, the latter from citric and tartaric acids and cream of tartar used as ingredients, these being crystallized by their manufacturers in leaden pans. Almost all "canned" goods contain more or less tin as a contamination from the tin-plate. While animal foods do not attack the tin to any great extent, their acidity being small, almost all vegetable materials, especially fruits and tomatoes, powerfully corrode the tin covering of the plate, dissolving it and becoming impregnated with tin compounds. These tin compounds are by no means innocuous; yet poisoning from tinned vegetable foods is of rare occurrence. On the whole, tin-plate is a very unsuitable material for the storage and preservation of acid goods. Certain enamels, used for glazing earthenware or for coating metal cooking pots, contain lead, which they yield to the food prepared in them. Food materials that have been in contact with galvanized vessels sometimes are contaminated with zinc. Zinc is also not infrequently present in wines.

PARTICULAR ARTICLES ADULTERATED

We will now proceed to consider adulteration as practised during recent years in the more important articles of food.

Milk.—Milk adulteration means in modern times either addition of water, abstraction of cream, or both, or addition of chemical preservative. Owing to the wide variation to which milk is naturally liable it is exceedingly difficult to establish beyond doubt whether any given sample is in the state in which it came from the cow or has been impoverished. These natural variations are seen from the following analyses, fairly representing the maximum, minimum and mean composition of the milk of single cows:

	Minimum	Maximum	Mean
Specific gravity	1.0264	1.0370	1.0316
Fat	1.67%	6.47%	3.59%
Casein	1.79%	6.29%	3.02%
Albumen	0.25%	1.44%	0.50%
Milk sugar (lactose)	2.11%	6.12%	4.78%
Salts	0.35%	1.21%	0.71%
Water	80.32%	90.69%	87.40%

In market milk such wide variations are not so liable to occur as the milk from one animal tends to average that from another. The average composition of genuine milk supplied by one of the largest dairy companies in London, as established by the analysis of 120,000 separate samples recorded by Dr. P. Vieth, is fat 4.1%, other milk solids ("solids not fat" or "non-fatty solids") 8.8%, total dissolved matters (total solids) 12.9%, the variations being from 3.6% to 4.6% in the fat and 8.6% to 9.1% in the solids not fat. It is clear that the 4.6% of fat could be reduced, by skimming, to 3.0%, and the 9.1% of solids not fat to 8.5% by

addition of water, without bringing the composition of the milk thus adulterated outside that of genuine milk.

Condensed milk is milk that has been evaporated under reduced pressure with or without the addition of sugar. Generally one part of condensed milk corresponds to three parts of the original milk. There is no case on record of adulteration of unsweetened condensed milk, but sweetened milk has in the past been frequently prepared either from machine-skimmed or partly skimmed milk and sold as whole-milk. As sweetened condensed milk is largely used by the poorer part of the population for the feeding of infants, and as the fat of milk is its most valuable constituent, this class of fraud was particularly mischievous. The average composition of sweetened condensed milk may be taken, with slight variations, to be: water 24.6%, fat 11.4%, casein and albumen 10%, milk-sugar 11.7%, cane-sugar 40.3%, mineral matters 2.0%.

Cream.—There are, in England, no regulations or official standards relating to this article, the value of which depends upon its contents in fat. Additions of starch paste, or any thickening substance (other than cane or beet sugar), with the object of giving an appearance of richness to a naturally poor and dilute article, are forbidden in England. Within recent times all cream sold by others than milkmen, and much of that even, contained boric acid. The limit of boric preservative that might be permitted, but which was nearly always exceeded, was one-quarter of 1%. Its use is now prohibited altogether.

Butter.—Of all articles of food butter is the most extensively adulterated by the addition of water either directly or by the way of milk or salt. Another form of adulteration consists in the substitution of other fatty matters for the whole or part of the really valuable portion of the butter-fat. Margarine, coco-nut oil and other fats are of this class.

Margarine is frequently adulterated. Excessive amounts of water or of milk—margarines with over 30% of water are met with—sugar, glucose, starch, gelatinous matter, solid paraffin, in fact anything that is cheaper than fat has been used.

Cheese varies very widely in composition, so-called cream cheese containing not less than 60% of fat; Stilton upwards of 40%; Cheddar about 30%; Dutch, Parmesan and some Swiss and Danish less than 20%. The amount of water varies with the kind and age of the cheese and may be as low as 20% and as high as 60%. When, however, cheese is made from skimmed milk and the fat is replaced by margarine, as is the case in so-called "filled" or margarine cheeses, the sale of these amounts to an adulteration, unless the presence of the foreign substance is declared.

Lard.—Between the years 1880 and 1890 a gigantic fraudulent trade in adulterated lard was carried on from the United States. A great proportion of the American lard imported into England was found to consist of a mixture of more or less real lard with cotton-seed oil and beef-stearine. Maize oil is now used as a lard adulterant, its detection being far more difficult than that of cotton-seed oil.

Oils.—The most common adulterant of the more valuable oils, like olive oil, is cotton-seed oil. The oils expressed from the sesame seed or the earth-nut (arachis oil) are also frequently admixed with olive oil. Almond oil is adulterated with the closely allied oils from the peach-kernel or the pine-seed. Deodorized paraffin hydrocarbons also enter as adulterants into edible oils.

Flour and Bread as sold in England are almost invariably genuine. The old forms of adulteration, such as the use of alum for the production of a white but indigestible loaf from bad flour, have disappeared. The only admixture which has been met with during recent years is maize-meal in American produce. This is of inferior food value to wheat-meal. In 1927 a committee of the British Ministry of Health issued a report on the treatment of flour with chemical substances. These bleaching agents and so-called "improvers" are chiefly nitrogen peroxide, benzoyl peroxide, chlorine and nitrogen trichloride, acid calcium phosphate, acid ammonium phosphate and persulphates. It was considered that chlorine, nitrogen trioxide and benzoyl peroxide were more open to objection than the others, and that the use of physical rather than chemical methods of improving flour merited extension.

Sugar in its various forms is not subject to adulteration by the addition of inferior substitutes. There have, however, been numerous prosecutions for a fraud of another class, namely, the substitution of dyed beetroot sugar for Demerara sugar.

Marmalade and Jams.—In the preparation of marmalade and jams a part of the sugar, from 10% to 15%, is often now replaced by starch glucose. Artificial colouring matters and chemical preservatives are almost constant ingredients of jams. To such fruits which, when boiled with sugar, do not readily yield a jelly (strawberries, raspberries) an addition of apple juice is frequently made in the manufacture of jam, without much objection; the pulp of the apple, however, is sometimes bodily added as an adulterant. The only preservatives now allowed in England are sulphur dioxide and benzoic acid in quantities prescribed in the Statutory Rules and Orders, 1925, No. 775.

Tea.—In consequence of the proviso contained in the Food Act of 1875 that tea was to be examined by the customs on importation, such tea as was found to be admixed with other substance or exhausted tea being refused entry into England, the adulteration of tea has been virtually suppressed. The practice, very common a generation ago, of artificially colouring tea green with a mixture of Prussian blue and turmeric has quite vanished with the decline of the consumption of green tea.

Coffee.—A few cases of artificially manufactured coffee berries, made from flour and chicory, have been observed, but it would not be fair to speak of a practice of adulteration regarding coffee berries. Not infrequently coffee is roasted with the addition of some fatty matter or paraffin or sugar, to give to the roasted coffee a glossy appearance. These additions as a rule are small in amount. Ground coffee is often sold adulterated with chicory, sugar or caramel.

Cocoa and Chocolate are liable to a number of fraudulent additions. In the cheaper qualities of cocoa-powder, sugar and starch—the latter in the form of sago flour or arrowroot—are admixed in very large proportions, and, in order to give to such mixtures something like the appearance of genuine cocoa, red oxide of iron is added. This almost invariably is more or less arsenical. Cocoa-shell, a perfectly valueless material, is mixed in a very finely ground state with cocoa of the commoner kind.

Wine.—Much wine is fortified with alcohol made from other sources than the grape, and the addition of sugar, precipitated chalk, salts of zinc, to correct the product of poor vintages is common in certain instances.

Beer cannot be said to be adulterated, although materials often very different from those which the general public believe to be the proper raw materials for the manufacture of beer, namely, water, malt and hops, are largely used. That is to say, beer is legally anything that is sold as beer provided that it has 2% of proof spirit. There is not any restriction upon the materials that are employed provided that they are not positively poisonous. For inland revenue purposes, however, a prohibition has been made against the admixture of anything to beer after it has been manufactured, and excise prosecutions of publicans for watering beer are not infrequent.

Non-alcoholic Drinks.—Of these again it is hardly proper to speak as liable to adulteration. So-called soda-water is very often devoid of soda and is only carbonated water. Potash and especially lithia waters very frequently contain only mere traces of the substances from which they derive their names. The sweetness of ginger-beer and often of lemonade is no longer due to sugar but to saccharine (the toluol derivative), which is possessed of sweetness but not of nourishment; and since, as an antiseptic, it may affect the digestion, its use in these beverages is to be deprecated.

Vinegar ought to be the product obtained by the successive alcoholic and acetous fermentation of a sugary liquor. When this is obtained from malt or from malt admixed with other grain the vinegar is called a malt vinegar. Often, however, acid liquors pass under that name which have been made by the action of a mineral acid upon any starchy material such as maize or tapioca, with or without the addition of beet sugar. Dilute acetic acid, obtained from wood, is very frequently used as an adulterant of vinegar.

When properly purified such acid is unobjectionable physiologically, but it is improper to sell it as vinegar. Adulteration of vinegar by sulphuric or other acids, formerly a common practice, is now exceedingly rare.

Spirits.—For many years the only form of adulteration known was dilution with water. It was, however, well known that many so-called brandies were not the product of the grape, but that spirits of other origin were mixed with grape brandy. These were deficient in alcohol derivatives ("esters") to which the flavour of real brandy is due. For the present a brandy is not considered genuine unless it contains in 100,000 parts (calculated free from water) at least 60 parts of "esters." As a consequence a trade has sprung up in artificially produced esters, sold for the purpose of adding them to any spirit to convert it into a liquor passing as "brandy." Formerly a common form of adulteration of whisky was the addition to it of spirit made on the Continent mainly from potatoes.

Drugs.—Very few of the great number of drugs included in the pharmacopoeias are liable to serious adulteration, and cases on record during recent years where real fraudulent adulteration was involved, are rare. Certain perishable drugs, such as sweet spirits of nitre, or others liable to contain from their mode of manufacture metallic impurities, form the subjects of frequent prosecutions, but the element of intentional fraud which characterizes many forms of food adulteration is happily generally absent in the case of drugs.

Results of Legislation.—In general it may be said that so far as England and Wales are concerned the effect of the application of the food laws has been entirely beneficial. Not only has the percentage proportion of samples found adulterated largely declined, but the gross forms of adulteration which prevailed in the middle of the 19th century have almost vanished. Plenty of fraud still prevails, but poisoning by reckless admixture is of exceedingly rare occurrence. Whilst formerly milk was not infrequently adulterated with an equal bulk of water, few fraudulent milkmen now venture to exceed an addition of 10% or 15%.

So far as concerns the latest regulations in England, section 4 (1) of the Public Health (Preservatives, etc., in Food) Regulations 1925, dated August 4, 1925, made by the Minister of Health is as follows:

4.—(1) No person shall manufacture for sale or sell any article of food which contains any added preservative or any of the colouring matters specified in part ii. of the First Schedule to these Regulations: provided that—(i.) any article of food specified in part i. of the said Schedule may contain preservative of the nature and in the proportion therein specified; (ii.) where an article of food specified in part i. of the said Schedule is used in the preparation of any other article of food, the latter article may contain any preservative necessarily introduced by the use of the former article, but the total proportion of any one preservative contained in any article of food specified in that part of the Schedule shall not exceed the proportion therein specified. For the First Schedule see adjoining column.

FOOD LAWS IN THE UNITED STATES

In the United States the control of foods is exercised by the Federal Government of the United States under the Federal Food and Drugs act, the Meat Inspection act, the Tea Inspection act and certain acts relating to specific products such as filled cheese, filled milk, butter and mixed flour. Forty-seven of the 48 States of the Union have some form of food control legislation. A number of States have laws which follow the general principles of the Federal Food and Drugs act, but other States have laws differing very materially from that act. In some States foods are controlled under the general provisions of one act, in other States they are controlled under a number of acts relating to specific

PART I.—Articles of Food Which May Contain Preservative and Nature and Proportion of Preservative in Each Case:—

The articles of food specified in the first column of the following table may contain the preservative specified in the second column in proportions not exceeding the number of parts (estimated by weight) per million specified in the third column:—

Food	Preservative	Parts per million
1. Sausages and sausage meat containing raw meat, cereals and condiments	Sulphur dioxide	450
2. Fruit and fruit pulp, not dried:		
(a) Strawberries and raspberries	" "	2,000
(b) Other fruit	" "	1,500
3. Dried fruit:		
(a) Apricots, peaches, nectarines, apples and pears	" "	2,000
(b) Raisins and sultanas	" "	750
4. Unfermented grape juice and non-alcoholic wine made from such grape juice if labelled in accordance with the rules contained in the Second Schedule to these Regulations	Benzoic acid	2,000
5. Other non-alcoholic wines, cordials and fruit juices, sweetened or unsweetened	{ Either sulphur dioxide or benzoic acid	350 600
6. Jam (including fruit jelly prepared in the way in which jam is prepared, but not including marmalade made from citrus fruits)	Sulphur dioxide	40
7. Candied peel	" "	100
8. Sugar (including solid glucose)	" "	70
9. Corn syrup (liquid glucose)	" "	450
10. Gelatine	" "	1,000
11. Beer	" "	70
12. Cider	" "	200
13. Alcoholic wines	" "	450
14. Sweetened mineral waters	{ Either sulphur dioxide or benzoic acid	70 120
15. Brewed ginger beer	Benzoic acid	120
16. Coffee extract	" "	450
17. Pickles and sauces made from fruit or vegetables	" "	250

PART II.—Colouring Matters Which May Not Be Added to Articles of Food

1. METALLIC COLOURING MATTERS

Compounds of any of the following metals:

Antimony	Copper
Arsenic	Mercury
Cadmium	Lead
Chromium	Zinc

2. VEGETABLE COLOURING MATTER

Gamboge

3. COAL TAR COLOURS

Number of colour index of Society of Dyers and Colourists, 1924	Name	Synonyms
7	Picric acid	Carbazotic acid
8	Victoria yellow	Saffron substitute; dinitrocresol
9	Manchester yellow	Naphthol yellow; Martius yellow
12	Aurantia	Imperial yellow
724	Aurine	Rosolic acid; yellow coralline

food products. Each State has complete control of the foods produced and consumed within that State. The Federal Government has control of foods shipped into interstate or foreign commerce.

The Federal Food and Drugs act, approved on June 30, 1906, and amended in 1912, 1913 and 1919, provides in general that all foods coming within its jurisdiction be prepared in a cleanly manner from pure and wholesome materials; free from any added substances which might render them injurious to health; not labelled or sold under representations which are in any manner deceptive. Food packages must bear a plain and conspicuous statement of the quantity of the contents.

The Meat Inspection act, approved on June 30, 1906, provides that every establishment in which cattle, sheep, swine or goats are slaughtered or their carcasses are wholly or in part canned, cured, smoked, salted, packed, rendered or otherwise prepared for transportation or sale as articles of interstate or foreign commerce, shall be inspected under the act. The inspection begins when live animals are received for slaughter, and includes a thorough ante-mortem and post-mortem examination, a rigid inspection of products such as smoked or cured meats, lard and by-products, and a final inspection when meats and their products leave the inspected establishments.

The Tea Inspection act of March 2, 1897, amended on May 16, 1908, provides that all shipments of tea offered for entry into the United States shall be inspected to see that they comply with the standards of quality and purity adopted each year by a board of tea experts appointed by the secretary of agriculture. Every consignment of tea offered for entry into the United States is inspected, and only such tea admitted as complies with the standards.

The department of agriculture in the enforcement of the Federal Food and Drugs act endeavours to see that out of the great volume and variety of foods coming from other countries only such as comply with the act are allowed to enter the United States. Shipments in violation of the Food and Drugs act are denied entry into the United States, and if not exported within three months are destroyed. If the violation is a form of misbranding that can be entirely corrected by relabelling, the importer is permitted to relabel the shipment, after which it may be admitted to the country, if the relabelling is correct. Foods that are harmful to health, however, are not admitted to the United States and must be exported or destroyed.

For the control of interstate commerce two forms of action are provided by the Federal Food and Drugs act—criminal prosecution against the party responsible for the violation, and seizure of any shipments of adulterated or misbranded foods or drugs found in interstate or foreign commerce. Both actions may be invoked when necessary. Under the Federal Food and Drugs act more than 14,000 cases, including both criminal prosecutions and seizures, have been terminated in the Federal courts and the results published in the form of notices of judgment. This number represents only those instances of flagrant misbranding or adulteration in which court action was necessary to check the practice. Countless minor violations have been corrected by serving notices on the firms responsible without recourse to formal legal action.

Most of the grosser forms of adulteration and misbranding which prevailed at the time of the enactment of the Federal Food and Drugs act and Meat Inspection act in 1906 have been eliminated as general trade practices. Occasional sporadic instances on the part of widely scattered dealers to adulterate and misbrand in the old way are still detected at intervals; but such practices are no longer general. New and more subtle forms of adulteration, however, are being detected. As a result of the effects of pure food legislation by the Federal and State Governments, and by the application of the principles of sanitary science in the food industries, very great improvement was made in the purity of food in the markets of the United States between 1910 and 1925. No other classes of merchandise are to-day, on the whole, so free from adulteration and misbranding as foods.

ADULTERY, the sexual intercourse of a married person with another than the offender's husband or wife (from Lat. *adulterium*). Among the Greeks, and in the earlier period of Roman law, it was not adultery unless a married woman was the offender. The foundation of the later Roman law with regard to adultery was the *lex Iulia de adulteriis coercendis* passed by Augustus about 17 B.C. (See *Dig.* 48. 5; *Paull. Rec. Sent.* ii. 26; *Brisson, Ad Leg. Iul. de Adult.*) (See **DIVORCE**.)

ADUWA (previously Adowa), in the province of Tigré, northern Abyssinia, 145m. north-east of Gondar and 17m. east by north of Aksum, the ancient capital of Abyssinia. Aduwa, a

ADUWA, CAPITAL OF TIGRÉ, IS THE CHIEF CENTRE OF TRADE BETWEEN CENTRAL ABYSSINIA AND THE COAST. HERE IS SHOWN THE CHURCH OF THE SAVIOUR OF THE WORLD

hill-slope at an elevation of 6,500ft., in a rich agricultural district, is an important market centre. On a hill about 2½m. north-west of Aduwa are the ruins of Fremona, the headquarters of the Portuguese Jesuits who lived in Abyssinia during the 16th and 17th centuries. On March 1, 1896, in the hills north of the town, was fought the battle of Aduwa, in which the Abyssinians inflicted a crushing defeat on the Italian forces (see **ITALY: History and ABYSSINIA: History**).

AD VALOREM. The term appropriately used in commerce for a duty which is levied by customs authorities on goods or commodities "according to value." An ad valorem duty is the opposite of a "specific" duty, which is chargeable on the measure or weight of goods. The early English customs tax called "poundage" was an ad valorem duty levied at the rate of one shilling in the pound, or five per cent. In Great Britain in 1927 the duties, commonly called "McKenna Duties," on motor cars, musical instruments, etc., and most of those under the Safeguarding of Industries act, are on an ad valorem basis, and duties of this description are also levied in several British overseas dominions and in the United States of America; in some cases a combined specific and ad valorem duty is leviable, particularly in the United States.

The general practice in the United States is that duty is levied on the foreign export value, i.e., the actual cost at the place of purchase, or the home consumption value in the exporting country, whichever is the greater. It is usual to require at the port of entry the production of an invoice with full particulars of the place where, time when, and the person from whom the goods were purchased, and the actual cost of the goods and any charges on them. Such invoice has to be countersigned by the American consular officer for the district from which the goods are actually destined for America, i.e., place of consignment, not place of shipment. On arrival at the U.S. port of entry the invoice is sworn to by the importer. The definite establishment of the dutiable value is then decided upon by the appraisers at the port of entry, appeal lying to the customs court, formerly the board of general appraisers.

In the British overseas dominions ad valorem duties are usually assessed on the value of the goods in the home trade of the exporting country. In some countries, although nominally ad valorem duties are imposed by the tariff, in practice arbitrary unit values are fixed, either periodically as in the case of Egypt or permanently as in the case of Argentina; the prescribed ad valorem duty is levied on these arbitrary valuations, thus in effect making the duties specific.

It has been argued that, theoretically, an ad valorem duty is preferable to a specific duty, inasmuch as it falls in proper proportion alike on the high-priced and low-priced grades of a commodity, and no matter how the value of any article fluctuates the rate of taxation automatically adjusts itself to the new value. This adjustment has been of particular importance in countries where the currency has been subject to violent fluctuations or where prices have been notably unstable. In practice, however, ad valorem duties may lead to great inequalities and are also difficult to assess equitably; while the relative value of two commodities may remain relatively unchanged under an ad valorem duty, yet owing to the difference in the cost of production, or through the different proportions of fixed and circulating capital employed in their manufacture, an ad valorem tax will be felt much more severely by one commodity than another, from the exporter's point of view. Again, there is always a difficulty in obtaining a true valuation of the exported goods, for values from their very nature are variable.

Ad valorem fees are imposed by some countries (mostly Latin American) on the consular certification of invoices, which are necessary for the clearance of goods through the customs on arrival at the port of destination. These range from 2% to 10%.

The term ad valorem is also used for British stamp duties. By the Stamp Act of 1891, certain classes of instruments, e.g., bills of exchange, conveyances or transfers, leases, mortgages, etc., must be stamped in England with the proper ad valorem duty, that is, the duty chargeable according to the value of the subject-matter of the particular instrument or writing. (See STAMP DUTY; CUSTOMS; SAFEGUARDING OF INDUSTRY.)

ADVANCED GUARD, the protective detachment pushed forward in advance of an army, or smaller force, moving towards the enemy. Although protective in purpose, its action is largely offensive in order to fulfil its duties. These are to gain information of the position and strength of the enemy's main forces, to deny similar information to the enemy's reconnoitring troops, to brush aside his advanced detachments and so prevent delay to the march of the main body. When the advanced guard eventually comes to grips with the real strength of the enemy, it should fix him securely in order to allow its own main force to deploy and manoeuvre. Gaining time is then as vital as saving time in the earlier phase, and for this purpose the advanced guard may have to resort to attack, defence, or an alternation of both.

The rôle of an advanced guard may be likened to that of an outstretched arm of a man moving in the dark. Flank guards and rear guards are variations of an advanced guard whose names explain their rôles. Outposts are a protective detachment to a force halted.

ADVANCEMENT, a term used in English law to describe a sum of money or other benefit conferred by a father or a person *in loco parentis* upon a child by blood or adoption for the purpose of establishing such child in life. It may be considered thus:

1. Advancements during a father's life when the father dies intestate. The law as to this is of very ancient origin but is now summed up for our purpose in ss. 47 1 (iii.) and 49 (a) of the Administration of Estates Act 1925. By the former, when a person who dies intestate has during his life paid money or transferred property to a child of his by way of advancement, or has settled money or property on a child of his on such child's marriage, then, if on the parent's death intestate the child is entitled to a share of the parent's estate, the money or property advanced or settled is to be taken *prima facie* as being so paid or settled in and towards the satisfaction of such child's share of the estate as one of the next of kin, and must be taken into account in apportioning the estate among the issue of the intestate. The

value of the advancement is what it is worth at the death of the intestate. By s. 49 (a), where a testator dies partially intestate, any benefits given to the issue of the testator by the will are to be brought into account as if they were advancements in distributing the undisposed of estate among such issue.

2. Double portions. The provisions of s. 49 (a) are really an adaptation of the equitable rule against double portions to cases of partial intestacy. By that rule, where a father or person *in loco parentis* by his will leaves a legacy to a child by blood or adoption and afterwards gives an advancement to such child, then if the advancement was of property of a similar description to that given by the will, the advancement is *prima facie* to be taken as an ademption, total or *pro tanto*, of the legacy. In the same way if the deceased has before he made his will covenanted to advance a certain sum to the child, then if, not having made the advancement during his life, he by his will leaves a legacy to the child, or if he dies intestate and the child is entitled to a share of his estate as next of kin, the legacy or the share of the estate is to be taken into account in total or *pro tanto* satisfaction of the debt due by the covenant.

3. Formerly advancements out of the capital of property held in trust for sale for persons absolutely or contingently entitled could only be made by direction of the court. Now they may be made by the trustees at their absolute discretion, provided that no more than one half part of the cestui que trust's actual and prospective share is so advanced, that if the person advanced becomes indefeasibly entitled to a share of the trust property the amount advanced shall be taken into account, and that no interest in the trust property taking precedence of his share shall be prejudiced by such advancement without the owner's consent in writing (see the Trustee Act 1925, s. 32).

ADVANTAGE, that which gives gain or helps forward in any way (Fr. *avant*, before). It is often contracted to "vantage." In some games (e.g., lawn tennis) the term "vantage" is used technically in scoring. A position which gives a better chance of success than its surroundings is called a "vantage ground."

ADVANTAGE, MECHANICAL. Mechanical advantage is obtained by using a machine which exerts a force greater than the force applied, and is expressed by the ratio $\frac{\text{force obtained}}{\text{force applied}}$.

"Machine" is here used in its widest sense, the simplest form being the lever. (See MECHANICS.)

ADVENT (Lat. *Adventus*, sc. *Redemptoris*, "the coming of the Saviour"), a holy season of the Christian Church, the period of preparation for the celebration of the nativity or Christmas. In the Ethiopic Church it lasts from Nov. 11, in other Churches from the Sunday nearest to Nov. 30, till Christmas. It is uncertain at what date the season began to be observed. A council at Saragossa in 380 forbade the faithful to be absent from church from Dec. 17 to Epiphany; but the first unquestionable mention of Advent is at the Council of Tours (567). It has long been recognized in the West as the beginning of the ecclesiastical year. The Roman Catholic Church forbids the solemnization of marriage during Advent.

In many countries Advent was marked by diverse popular observances, some of which still survive. In some parts of England poor women used to carry round the "Advent images," two dolls dressed to represent Christ and the Virgin Mary, visiting every household and demanding halfpence.

In Normandy the farmers still employ children under 12 to run with torches through the fields and orchards setting fire to bundles of straw to drive out vermin. In Italy the last days of Advent are marked by the entry into Rome of the Calabrian pifferari who play bagpipes before the shrines of the Holy Mother (as the shepherds of Bethlehem are believed to have done before the infant Saviour).

ADVENTISTS, SECOND, members of religious bodies whose distinctive feature is a belief in the imminent physical return of Jesus Christ. For the historical affiliations of this doctrine, see ESCHATOLOGY.

ADVENTITIOUS, coming from outside, in no sense part of the substance or circumstance (Lat. *adventicius*, coming from

abroad). Carlyle called a man's clothes, or condition of life "adventitious wrappages," as being superadded and not a natural part of him. In botany the word means that which is not normal to the plant, e.g., buds or roots out of place, or strange spots and streaks not native to the flower.

ADVENTURE, a hazardous enterprise. Thus an "adventurer," from meaning one who takes part in some speculative course of action, came to mean one who lived by his wits and a person of no character. The word is also used in certain restricted legal connections. *Joint adventure*, for instance, may be distinguished from partnership (*q.v.*). The *bill of gross adventure* in French maritime law is an instrument making a loan on maritime security. The word was freely used of mercantile enterprises during the colonizing period: hence the title of "Merchant Adventurers." (See CHARTERED COMPANIES.)

ADVERB, a part of speech modifying or qualifying an adjective, verb or other adverb. According to their function they are divided into adverbs of time, place, quantity, manner, etc.

ADVERTISING, the process of disseminating information for commercial purposes. Advertisement has existed from early times. Traders made themselves known and called attention to their products by mural inscriptions before the age of printing: a papyrus, discovered at Thebes offering a reward for a runaway slave, is reputed to be 3,000 years old.

The public crier, a civic institution in ancient Greece, is not yet extinct. In the middle ages the spoken word was almost the only mode of publicity in use. The invention of printing ushered in the modern period of advertising. The Bodleian library has a small poster or broadside by William Caxton, 7in. by 5in., advertising a service-book, "The Pyes of Salisbury Use" for sale at the Red Pole in the almonry of Westminster. It was issued in 1480. Printing alone made possible the transition from simple announcement to the system of argument and suggestion which constitutes modern advertising, and the medium of this development was the newspaper. The *Mercuries* or weekly papers sometimes carried a few advertisements, including the first offerings of coffee (1652), chocolate (1657) and tea (1658).

In June 1666 the *London Gazette*, No. 62, announced the first advertisement-supplement, as follows: "An Advertisement—Being daily prest to the publication of Books, Medicines, and other things not properly the business of a Paper of Intelligence. This is to notifie once for all, that we will not charge the *Gazette* with Advertisements, unless they be matter of state; but that a Paper of Advertisements will be forthwith printed apart, and recommended to the Publick by another hand."

In No. 94 of the same journal, published in Oct. 1666, there appeared a suggestion that sufferers from the Great Fire of London should avail themselves of this means of publicity: "Such as have settled in new habitations since the late Fire and desire for the convenience of their correspondence to publish the place of their present abode, or to give Notice of Goods lost or found, may repair to the corner House in Bloomsbury on the East Side of the Great Square, before the House of the Right Honourable of the Lord Treasurer, where there is care taken for the Receipt and Publication of such Advertisements."

Clearly, the restriction of the word "advertisement," which for Shakespeare and the translators of the Authorized Version had meant information of any kind, to a business announcement was in *The Tattler* of Sept. 14, 1710:

"It is my custom, in a dearth of News, to entertain myself with those Collections of Advertisements that appear at the end of all our Publick Prints. . . . Advertisements are of great use to the vulgar. First of all, as they are instruments of ambition. A man that is by no means big enough for the *Gazette* may easily creep into the advertisements. . . . A second use which this sort of writings have been turned to of late Years, has been the management of Controversy. . . . The inventors of *Strops for Razors* have written against one another in this way for several years. The third and last of these writings is to inform the World where they may be furnished with almost everything that is necessary for Life. If a Man has Pains in His head,

Cholic in his Bowels, or spots in his Cloathes, he may here meet with proper Cures and Remedies. If a Man would recover a Wife or a Horse that is stolen or strayed; if he wants new Sermons, Electuaries, Asses' milk, or anything else, either for his Body or his Mind, this is the place to look for them in."

By the middle of the century, advertisements began to be complained of, and the stains which the practice of that age left upon its reputation are not yet quite obliterated. In *The Idler* Jan. 20, 1758, Dr. Johnson has:

"Advertisements are now so numerous that they are very negligently perused, and it is therefore become necessary to gain attention by magnificence of promises and by eloquence sometimes sublime and sometimes pathetick. Promise, large promise, is the soul of an advertisement. I remember a washball that had a quality truly wonderful—it gave an *exquisite edge to the razor*! . . . The trade of advertising is now so near to perfection that it is not easy to propose any improvement."

MODERN ADVERTISING IN GREAT BRITAIN

Complaints have been heard in our own time, though the loudest of them were directed against unsightly notice-boards in rural surroundings. A British society for correcting the abuses of public advertising has been active in this, but the suppression of fraudulent advertising was left to the industry itself. The national vigilance committee of the advertising association systematically calls the attention of newspaper-publishers to doubtful announcements, and the censorship committee of the British poster advertising association (a society of hoarding-owners) is powerful enough to suppress any poster calculated to offend public taste or morality.

Such movements in restraint of abuses are a mark of the modern spirit in advertising, which claims the name of an economic necessity. Through the use of trade-marks and other brands, it enables a consumer to identify wares of standard quality, while by aiding the distribution of merchandise, and sometimes facilitating the introduction of useful inventions which could not be produced at all if they were not marketable on a large scale, it performs public services of no small value.

The use of advertising as an aid to distribution of goods is traceable to the coming of railways and the factory system, early in the 19th century. When commodities of many kinds, formerly produced slowly by hand in small workshops, began to be turned out in large quantities by machinery, markets had to be enlarged, or overhead expenses and interest charges might have crippled the young factories. Simultaneously, improved and cheapened transport made it possible for manufacturers to seek custom far afield.

Economic and Psychological Aspects.—Economic justification has only been claimed for advertising in quite recent times. George Binney Dibblee (*The Psychological Theory of Value*, 1924) showed that the measure of exchange value is the purchaser's desire to possess. Distribution is perceived to be for practical purposes an element of production, since production is useless without it. Distributive costs can be greatly reduced by publicity, but through the stress of competition, the economies thus obtained cannot be retained by the producer, who is therefore stimulated to improve the quality of his wares or to reduce his prices. The consumer thus becomes the beneficiary of advertising.

The statement may seem to require explanation since the cost of advertising must necessarily be added to the price of the goods. Other and larger expenses, however, are reduced or saved. The economy of mass-production is well known. The effects of advertising may be described as mass-selling. Where a specific article is demanded by the public and bought in large quantities, the expense of prevailing upon retailers to offer it for sale is greatly reduced. A commercial traveller, instead of selling by slow persuasion to a few shopkeepers, has only to call on the wholesale trade for orders; sometimes travellers can be dispensed with altogether as salesmen, being employed only to stimulate the proper display and exploitation of the goods.

Yet another economic service of advertising to the public is

the assistance which it gives to the habit of using branded or trade-marked goods. Manufacturers of these have a natural interest in maintaining a good and uniform standard of quality, whereby the reputation of the brand is upheld. When large sums have been invested in advertising, the motive of self-interest in maintaining quality is proportionately great. If advertising did no more than favour the consumption of branded, and (as a consequence) standardized, wares, it still would have the economic justification which is not inherent in it regarded as a mere aid to competition. But it does more. By giving news of desirable things it actually increases the volume of trade and in that same measure reduces unemployment. This fact is recognized and is turned to account in a highly significant use of advertising during the present century. In a certain number of industries in Great Britain manufacturers have banded themselves together to advertise their product jointly and uncompetitively. This co-operative advertising, as it is called, has been applied to such manufactured products as gas, woollen textiles, tyres, motor-cars and paint; and such agricultural products as milk, British tomatoes and fruit. The success achieved in these and in other spheres is naturally encouraging other manufacturing and trading groups to similar acts of combined selling. The most conspicuous advertising campaigns of this character have, of course, been those of the empire marketing board, which enjoys a large government grant. Its operations are yet another instance of State advertising—this time of a productive nature, more agreeable to contemplate than those that served the deadly purposes of war.

Apart from the effects of reasoned exposition, the psychological mechanism by which advertising operates to sell goods may briefly be summarized under two headings.

Constant repetition of a name makes a path in the mind. The consumer, in want of a given commodity, tends to take the path made ready for him by the reiteration of the brand-name.

Association of ideas has an effect somewhat similar on the subconscious mind. If an article be advertised systematically in a tasteful and elegant way, or if verbal or pictorial suggestions of an agreeable kind have been attached to it, the brand-name and an accompanying good opinion of it are entwined among the roots from which volition springs.

A very similar kind of suggestion is exercised by the form in which goods are announced. Modern scientific salesmanship has discovered that emotion plays at least an equal part with cold and deliberate reason in the selection of wares. Attractive and tasteful presentation in both goods and advertisements has an appeal which often proves irresistible.

Organization.—The financial importance of advertising cannot easily be computed unless some agreement be reached upon what, for the purpose of the calculation, shall constitute an advertisement. If the total cost of all Press advertisement, hoarding-space and posters, of all other outdoor publicity and of the printing and postage in advertising by circular, be added together, the yearly outlay must be enormous. There remains to be added very large payments for show-cards, signs, pamphlets, handbills, the window-dressing apparatus and equipment sent to shop-keepers or provided by them, price-lists, catalogues and other printed matter (often in colour) issued by the great departmentalized shops. A substantial sum for printing-blocks, lithographic stones and other materials consumed must also be taken into account. A lecturer at the London school of economics and political science estimated the annual total in Great Britain in 1919 at 100 millions sterling, and the charges for newspaper space have risen very considerably since then; but it is doubtful whether any satisfactory estimate can be formed. Several individual companies are known to spend more than £200,000 annually on publicity and a larger number spend £100,000 or over—in almost every instance for the marketing of cheap, popular commodities. Nor is it easier to compute the number of persons employed in and by advertising. Among the specialized avocations which it has called into being are those of advertising agents, contractors for poster-advertising, advertisement consultants, commercial studios (whose work is practically confined

to the designing of advertisements), research men and window-dressing specialists; besides a large number of printers, lithographers and blockmakers, wholly or chiefly employed in the varied services of publicity.

In order to provide something in the nature of a qualification or certificate of proficiency, public examinations in the theory and practice of advertising were initiated in Great Britain in 1925 by the incorporated society of advertisement consultants, and being continued annually, attracted a considerable number of candidates in each year. They have since been taken over by the advertising association, which represents all branches of the business, and the certificate of either of these bodies is widely accepted as a qualification for employment.

Of all the avocations directly concerned that of the advertising agent is the most important and the most varied; and it is to the work and influence of the great advertising agencies that the vast growth and development of advertising in the last 35 years are chiefly due. The service of a first-class advertising agency to its clients includes direct examination of markets and elaborate research work; the designing of packages and wrappings for new articles; the invention of selling plans; the formulation of an advertising policy and its embodiment in Press advertisements and sometimes posters; preparation of window-dressing designs and materials and of show-cards, and contracting with newspapers, periodicals and hoarding-owners for the supply of space. Yet more important than these is the work, largely carried out by the agencies and also by advertisement consultants, of bringing to the notice of manufacturers and others proposals for the benefit of their respective businesses by means of national or trade advertising, whereby those who have not yet turned to advertising for the promotion of their business interests are induced to avail themselves of it.

A marked tendency now exists for advertising agents to claim something like professional status and to prescribe rules of conduct for themselves. In Great Britain an institute of incorporated practitioners in advertising has been founded, whose standards of practice are strict.

Preparation of Advertisements.—For the actual preparation of advertisements, as for the work of contracting with publishers and the owners of hoardings and other outdoor sites, an advertiser may either keep his own staff or employ advertising agents and poster advertising contractors. In most instances he prefers the latter course, entrusting the general conduct of his advertising to an agent, but keeping the control of it in principle and detail firmly in his own hands. It is to his advantage to employ an advertising agency, as most of the work (including the drafting of advertisements and the preparation of rough designs) is performed without expense to himself, the agency receiving a trade discount on the price of space.

The agent's functions are a matter of arrangement, but generally speaking an advertiser pays for the drawings required for Press or poster advertising unless these are of the simplest character. The larger agencies maintain a studio with a supervisor and a sufficient number of artists and draughtsmen for their normal requirements. At times of pressure, or when work has to be done for which this staff is not sufficiently well equipped, resort may be had to one of the commercial studios, and advertisers who prepare their own "copy" are regular patrons of these establishments. The larger studios sometimes retain commercial artists of reputation, in addition to a whole-time staff of artists, draughtsmen, designers and what are termed lay-out men. The function of the last named is to contrive the skilful arrangement of type, and the well-balanced combinations of pictures and lettering, with which the reader is familiar in advertisements.

Marketing Plans.—The distribution of an advertised article to the public is usually effected through retail traders and middlemen. To advertise anything to the public without first arranging that supplies shall be available when demanded is wasteful; the public will not always wait while the advertised article is obtained. Hence, the first step taken, when anything is to be marketed by the aid of advertising, is to convince the distributing trades that the advertising which is projected will in fact create

a demand profitable to those who handle the goods. Retailers will then place initial orders for stocks either directly or through middlemen, and the latter will place themselves in a position to fulfil their further requirements. Advertisements in trade papers prepare the way for circulars and travellers, whose work is thereby expedited in the breaking down of what is known as retailer resistance.

The expense of this preparatory work is considerable, and the discounts required by middlemen and retailers are nearly always much larger than the net profit of the producer. In some trades the largest manufacturers find it less expensive to maintain their own shops. The boot-and-shoe and margarine trades of Great Britain are examples. Another alternative is to advertise for direct orders from the public through the post, when the term mail-order trading is used. This expression, like much else in advertising, is American, but the system has also been very highly elaborated in Great Britain. Although orders for small and uncostly articles can be obtained in direct response to advertisements in newspapers and magazines, such advertisements are more often used with the object of compiling a list of names for circularization. Where the price is more than a few shillings, the advertisement seldom asks for any remittance, and, if instalments are to be accepted, often gives no clue to the price, merely offering a catalogue or descriptive pamphlet. Applicants for this receive very elaborate printed matter, showing signs of careful attention to detail and little, if any, regard for expense. Those who do not respond with an order for the goods advertised receive further circulars and letters according to an organized plan known as the follow-up system.

Such a system requires extreme patience and forethought, no detail being too small to affect results. In the marketing of goods trifles often make perfection. Variations in detail are purposely introduced and examined in the light of their effect on enquirers; even the order in which the enclosures with a follow-up letter are arranged and the intervals at which successive follow-ups are sent out, are the subject of careful experiment. The follow-up process is continued as long as there are profitable returns. As the cost of each letter and its enclosures is considerable, when sent to a large number of persons, any argument and device which will bring the order to fruition earlier means a proportionate addition to the profits.

Direct circularization of addresses from directories is a variant of mail-order trading if results are sought by post. More frequently it is employed by large and by small shopkeepers, occasionally by general advertisers whose goods are distributed through trade channels, though the latter have difficulty in ascertaining whether their circulars bring profitable results or not. Unless a somewhat specialized public is sought, or a very complete and elaborately illustrated description has to be circulated, very little calculation is required to show that this method is much less economical than Press advertising; but it is a valuable alternative where capital is not available for the latter, or in places where no local paper may be available as an advertising medium; but such places are few and far between.

The Newspaper Press.—Systematic advertising dates from the rise of the newspaper Press. At first grudgingly admitted, inserted or left out at the editor's whim or convenience, advertisements came in time to exercise a reflex action on nearly all publications. The major revenue of newspapers and periodicals is derived from them, and great improvements in contents and production, accepted by readers as a matter of course, find their explanation and exchequer here.

Until quite recent times, advertisers in the great majority of British newspapers and periodicals laboured under a grievance not yet wholly redressed. Publishers resolutely withheld any information about the net sales of their publications, and perhaps even permitted exaggerations as to the actual number of copies printed and sold to stalk about unchecked and assume the dimensions of mere rumour. In consequence, the advertiser rarely knew what measure of publicity his expenditure produced for him. He was in the dark concerning the arithmetic of circulation. A few publishers, however, broke away from the

general silence and mystery, and from 1920 onwards the custom of publishing an audited statement of net sales, with the certificate of a chartered accountant, has spread rapidly. The institute of practitioners in advertising maintains an audit bureau, by which this practice is encouraged. (By net sales is meant the actual number of copies sold and paid for. Circulation is a vague term, but it must be borne in mind that one purchased copy of a paper may have several readers, the whole household in fact.) A partial censorship of advertisements by newspapers has likewise extended, and while only a few publishers assume overt responsibility for everything inserted, nearly all, with the assistance of the advertising association's national vigilance committee, take pains to exclude anything to which objection can reasonably be taken.

The cost of Press advertising has risen steadily since the end of the World War. The best evidence of the fact that the burden is not too grievous to be borne is the persistency with which this form of publicity is used and the apparent prosperity of those whose expenditure is largest. The cost might well appal manufacturers of cheap commodities, were it not that the articles most largely advertised are those on which the percentage of profit is lowest. In a general sense it is true to say that the lower the factory cost of an article the larger the return from advertising. Where gross profits are heavy, the cost of advertising is high. Household soaps, cocoa, beef-extracts, condiments, bread and similar general requirements are advertised on an enormous scale, and the highest payments are made for contributions to the efficiency of announcements relating to them. All these articles have to meet the competition of goods marketed without publicity. Economies due to advertising enable them to meet this competition by superior quality.

Great sums are invested by advertisers in the writing and designing of announcements; and what is called copy-writing offers an attractive career to both sexes. The fact must not be overlooked, however, that the trading policy of which advertisements are the support and expression is more important to success than the advertisements themselves. Good writing and artistic decoration are important when they set forth and adorn some new or striking mode of distribution, where they reveal some new reason for preferring the article advertised, or where they turn the thoughts of the public in a new direction.

Papers issued daily, whether morning or evening, are, on account of their practical and business-like tone (whereby the mood of readers is affected), best suited for the advertising of everyday needs and other commodities ordinarily bought by routine and not with slow deliberation. The daily paper is in some sort a daily guide consulted for information on a number of topics. He who desires to rent a house, to find a servant, to attend a concert, to order coal, to hear of bargains, to hire a car or to buy a dog, turns to the advertisements in his daily paper as a matter of course. Announcements on these subjects almost have the character of news; the paper would be incomplete without them; but they would not be sent for publication unless such advertisements were known to bring replies. The newspaper which carries habitually the largest number of such small advertisements is the one to which more and more are sent. The appearance of numerous "smalls" or classified announcements, moreover, reacts on the quantity of displayed advertising sent to a paper, it being held that one in which the former appear must be powerful in the locality of publication.

It should be noted that in comparatively recent years in Great Britain the national morning popular paper has extended its geographical range and added considerably to its sales, while the evening papers in the provincial towns and cities have increased in power and importance.

Improvements in printing-blocks, mechanically reproducing drawings or photographs, have brought to the daily papers a preponderance of illustrated advertisements; and refusal to insert these, once common, is now the reverse. The only limitation placed on them (except on grounds of propriety) is that they be not over-obtrusive. Heavy masses of black are relieved by scoring them with white lines, and this is often done in the newspaper

office itself where something too black has been tendered. The rotary presses upon which daily papers are printed make it difficult to produce satisfactory results with great masses of black, or with half-tone blocks if the screen is finer than 50 or 60 lines to the inch. For an explanation of these terms the article *PROCESS* should be consulted.

The same difficulties do not occur in the slower flat-bed method of printing when smooth paper is used. Hence weekly illustrated periodicals are enabled to give advertisers the benefit of better printed half-tone blocks and in general of more perfect typography. This has led to a great development of illustrated publicity with a corresponding attention to the suggestive value of pictures in advertising.

The greater deliberation with which weekly and monthly periodicals are read, their higher price, and the automatic selection of a special public by the nature of the contents, makes these, on the face of them, more suitable for the advertising of expensive wares than are the popular dailies. The latter, by reason of enormously greater circulations, are employed by every class of advertisers, but only those who sell to a public which is entirely artisan can afford to confine their announcements to them. If what may be called the austere part of the Press be neglected, the richer and more cultured part of the public may be lost. The extension of public advertising has brought home to those who use it, and in some measure to their competitors also, that the real customer of every manufacturer is the ultimate consumer. It is just as needful for this ultimate consumer to be approached through his own especial part of the Press as through the class of shops which he habitually uses. This lends importance to the illustrated weeklies and other "society" papers and the literary Press far in excess of what could be attributed to them on the ground of circulation alone.

Besides periodicals of general interest, many others devoted to restricted subjects exist and have importance for certain advertisers. The monthly reviews—papers treating of almost every conceivable science, art and hobby, technical papers for the engineer and the manufacturer and trade papers for the shop-keeper—all have their places in the scheme of Press advertising.

Posters.—Next to the Press, the most important medium of publicity is the poster—defined as a sheet or combination of sheets of paper, printed with an advertisement and intended to be displayed out of doors. This definition excludes other things sometimes loosely referred to as posters, such as window bills and painted or other signs on roadways.

The poster, by reason of its size and the facilities which it affords for the use of colour, has a very powerful effect on the public mind. This effect is an instance of commercial suggestion. The impact, constantly repeated on the memory, of the name on a large coloured bill is almost irresistible. The aim of the advertiser is exactly that—to make his own brand synonymous with the generic name of the product which he sells. For this reason, newspaper advertisements sometimes contain nothing but the name of the product advertised, with some short phrase which, if associated with it for a period of time, is termed a slogan. As the effect sought is precisely similar to that of many posters, and as such announcements can be displayed before a much larger number of persons for a longer time by means of a poster than by the same expenditure of money in the Press, the poster is often found to be a better implement for the purpose. It is estimated that a commanding display of posters throughout Great Britain and Northern Ireland may be obtained, together with the posters themselves, for £60,000 a year. An equal preponderance in the Press would, at present rates, cost perhaps not less than £150,000. This comparison should not be accepted without remembering that the attention received by a newspaper or periodical is much closer and more intimate than that given to a poster. Nor must it be forgotten that the newspaper is bought by the reader and has on that account a value beyond the intrinsic; and further that the newspaper does in most cases enter the home. If more is desired than an instantaneous impact on the mind, the advertising value of the poster falls sharply. In its own sphere, however, it is at present unchallenged.

Improved colour-printing processes and certain details of organization have enormously influenced poster-advertising since it first began to have serious commercial importance. Small bills were pasted up out-of-doors at a very early date in the history of printing, as has already been shown. They may be presumed to have been so affixed to walls and gates without permission of the property-owner, and the practice continued in Great Britain until a date well within living memory. A furtive and disreputable trade was carried on until 1863, when Edward Sheldon, a Leeds billposter, introduced the practice of contracting with the owners for the use of wall space. This soon became general, and poster advertising of an organized character may be said to date from that time. Substantial hoardings, erected according to a standard plan and kept in good order by the contractor, with the growing practice of bordering each poster with neutral-tinted paper, have supplemented a vast improvement in design and execution. At first coarsely printed on letter-press machines from wooden type or blocks, usually in black and red, posters made a great stride forward with the rapid development of chromolithography from 1880 onwards. Very soon afterwards, a new school of designing from this use began to develop, especially in France. Details of this will be found in the article *POSTER*.

Other forms of outdoor advertising, especially in the country, have often brought undeserved opprobrium upon the poster. Field boards, displayed to railway passengers beside the route, caused a great outcry on their first introduction into Great Britain about 1890, and it was widely suggested that the objection to them on aesthetic grounds would make them ineffective as advertisements. This expectation seems to have been unfounded, as one of these advertisers, who reinforced the involuntary attention of passengers by adding a small tablet to each field-sign to show the distance from London, experienced an immediate rise in the sales of the article which he advertised.

The display of roadside and other advertisements where they deface natural scenery, once common, is now passing out of use, not solely as result of legislation, presently to be described, but also through the voluntary action of advertisers. The maxim that an Englishman's house is his castle makes parliament reluctant to restrain him from putting what he chooses upon the outside of it; but there are indications of a tendency in at least one trade to get round this difficulty: advertisers of motor spirit and lubricants are beginning to withhold signboards from owners of filling stations and repair shops in the country, after having removed their signboards from roadside positions and railway bridges.

Large painted signs on gable ends; sky-signs on the roofs of houses; a variety of illuminated signs, with a growing preponderance of flash-light effects; mobile devices for shop-windows; boards and enamelled iron signs on omnibuses; paper posters on the sides of carriers' vans; the rather antiquated expedient of sandwich-men; and motor delivery-vans modelled on the shape of the owner's speciality, enormously magnified, are among the other forms of outdoor publicity familiar to dwellers in towns. Some of these are the subject of legislative restriction, as will be shown.

Conveyance Advertising, which may be considered to include the display of bills at railway stations and in the London "tubes," is a rather specialized form of publicity. Advertisements on public vehicles are subject to the control of the police in London and other large cities. They are forbidden in or upon cabs, and when displayed on omnibuses they must be submitted to the approval of the police, the probable motive being to exclude anything which detracts from the conspicuousness of destination and route-boards. From the point of view of the advertiser, there is a perceptible difference between the effect of anything carried outside an omnibus, and seen by everyone but the passengers, and that of internal notices and window-transparencies, visible to them alone. What is held before a man's eyes from the moment he sits down until the end of his journey is more likely to be studied and remembered than something flashing past him in the street; but the external advertisement is seen by more people. The mobile poster on the side of a van is very effective and the growth of road transport in competition with the railways favours its use as an advertising medium.

MODERN POSTER ADVERTISEMENTS

Four examples of modern British and American poster design, illustrating the adaptation of artistic principles to the uses of publicity

Moving Advertisements.—The tendency of anything in motion to attract the eye is used by a growing number of advertisers in order to compel attention to shop windows. Shopkeepers are able to profit substantially by hiring out their windows for stated periods, to be "dressed" either by the servants of an advertiser, or according to a plan sent out by him and accompanied by the necessary equipment. Mechanical models, worked by electric motors, are sometimes included in these window-shows, but more often they are lent for long periods to the shopkeeper, to be used at will. But the most interesting development of moving advertisements is to be seen in picture-theatres, especially in the provinces.

A minor form of advertisement which nevertheless consumes substantial sums annually is known as the advertising novelty—a small object such as a penknife, cigarette holder, pencil, almanack, note-book or the like, carrying the advertiser's name and message. In the same category are included the ashtrays, match-holders and similar articles, bearing an advertisement, and distributed for use in hotels and restaurants.

Taxes were levied on advertisements in the Press from 1712 to 1853, and, though it is dangerous to prophesy in regard to times of economic stress, are not likely to be revived. The idea of imposing a duty on posters (common on the Continent) is mooted from time to time, generally at the instance of those who dislike them, but the proposal has not yet attracted any chancellor of the exchequer. The growing recognition of advertising as an economic influence in the betterment of trade is indicated by the abandonment of taxation and the official and increasing use of advertising by state departments. The British Empire exhibition at Wembley, to which the Imperial Government gave official support and subsidy, was an effort to advertise the Empire by almost every conceivable phase of modern publicity. And the British Industries fair, held annually simultaneously in London and in Birmingham, is advertised by the Government both at home and abroad.

Advertisements in British Law.—Apart from the provisions for formal notification by advertisement in the *London Gazette* and local papers of a large variety of matters of which the public should be informed, acts of parliament relating to advertisements have generally been restrictive. Nevertheless, public moneys have been voted with increasing readiness for advertising. Moreover, local authorities engaged in commercial undertakings (as gas and transport) have increasingly advertised their services, and, by the Health Resorts and Watering Places Act, 1921, the local authorities of such places were authorized to expend from certain moneys coming into their hands on advertising in other districts an amount not exceeding the amount produced by a penny rate.

Whatever their subject matter, certain forms of advertisement are forbidden, usually under by-laws of local authorities. By the Advertisements Regulation Act, 1907, such by-laws were authorized for the regulation and control of hoardings over 12ft. in height and for regulating, restricting or preventing the exhibition of advertisements calculated to affect injuriously the amenities of a public park or pleasure promenade, or to disfigure the natural beauty of a landscape. In 1925 the powers were extended to include advertisements which would disfigure or injuriously affect the view of rural scenery from a highway or railway, or from any public place or water, or the amenities of any village, or of any historic or public building or monument, or any place frequented by the public chiefly on account of its beauty or historic interest. The Home Office prepared model forms of by-laws, and more than 100 local authorities in Great Britain have exercised their statutory powers.

In congested areas further restrictions are often imposed for the greater safety or convenience of those using the streets. Thus, under the London Traffic Act, 1924, the minister of transport may within the London traffic area restrict the use of sandwich-men and other persons in the street for the purpose of advertisement, if they are likely to be a source of danger or to cause obstruction to traffic; and in 1927 the minister, Col. Wilfrid Ashley, M.P., forbade the use of displayed vehicles for advertising pur-

poses in certain streets. Within the City of London and the metropolitan police district, no person may carry on foot or horseback or any carriage in any thoroughfare or public place any advertisement to the obstruction or annoyance of the inhabitants or passengers (London Hackney Carriage Act, 1853), and by the Metropolitan Streets Acts 1867 and 1885 no advertisement except in such form and manner as may be approved by the commissioner of police having jurisdiction in the area, may, within six miles of Charing Cross, be exhibited or distributed in any street by any person on foot or riding in any vehicle or on horseback. In the County of London, by the London Building Act, 1894, and in areas in which the Public Health Acts Amendment Act, 1907, applies, sky-signs as defined by those acts are prohibited. By a by-law made in 1900 under general statutory powers for the suppression of nuisances, the London County Council, in great measure as a result of observation made at coroners' inquests, prohibited advertisement by searchlight or flash light causing danger to traffic in any street. "Flash light" is defined as a light which alters suddenly either in intensity, colour or direction. A large number of by-laws for the regulation of advertisements have been passed in different parts of Great Britain.

Other advertisements are prohibited by statute because they are themselves an evil or because they are incidental to evils which the legislature wishes to suppress. Although money-lending is a legitimate trade, it tends to create abuses unless it is severely restricted. In 1892 the sending of an advertisement to any infant inviting him to borrow money was prohibited. Much more drastic restrictions are imposed by the Moneylenders Act, 1927. No person may send to any person, except in response to such person's written request, any advertisement with the name, address or telephone number of a moneylender, or inviting him to borrow, or to enter into any transaction involving the borrowing of, or to apply for information as to the borrowing of money from, a moneylender. A moneylender may, however, advertise in newspapers and at an authorized address by poster or placard, but in each case the Act severely limits the contents of the advertisement. Moreover, an advertisement or document sent in response to a written request must show with due prominence the moneylender's authorized name, any other name in which he or a partner was registered under the Moneylenders Act, 1900, and must not contain expressions which might reasonably be held to imply that the moneylender carries on a banking business. If the terms of interest are indicated they must be stated at the rate per cent. per annum, or, if otherwise stated, the rate per cent. per annum represented by the interest proposed must also be shown.

By the Larceny Act, 1861, advertisements of reward for the return of property stolen or lost must not indicate that no questions will be asked or enquiries made, and must not promise to repay the purchaser or pledgee of stolen property. A number of statutes prohibit advertisements relating to betting and lotteries. The most recent is the Ready Money Football Betting Act, 1920. Prize schemes used for advertising are often illegal, as being lotteries. If in a competition skill contributes to the winning of a prize, however, the competition is not a lottery. Indecent and obscene advertisements are penalized by the Indecent Advertisements Act, 1889.

The general law also affects advertisements. False representations, offers to contract, defamatory statements, incitements to crime, contempt of court, breach of copyright and infringement of trade marks may be contained in advertisements and will be governed by the ordinary rules relating to deceit, contract, libel, crime and infringement of rights. The courts have, however, firmly refused to allow puffing advertisements to become the basis of law suits between rival traders, and will only give a remedy for the disparagement of goods by advertisement when false statements are made with specific reference to the plaintiff's goods, with intent to injure the plaintiff, and then only when the plaintiff has actually been involved in financial loss.

The law recognizes the value of advertisements to advertisers. Hence for breach of a contract to insert advertisements damages will be given for the loss of business due to the failure to insert the advertisements. Similarly, where advertisement can be shown

to be one of the objects of a contract—as, for instance, where an actor is engaged for a theatre of high repute—loss of publicity may be a substantial element in the damages recoverable for breach of the contract.

A summary of laws and regulations dealing with advertisements in certain other countries is contained in an official return issued by the British Home Office in 1903, but no similar return has since been issued.

UNITED STATES

In America, the first newspaper was entitled *Publick Occurrences both Foreign and Domestick*, published in Boston in 1690. This was succeeded in 1704 by *The Boston News Letter*, a weekly publication. The first issue of *The Boston News Letter*, published April 26, 1704, contained advertisements. It was 40 years before this publication reached a circulation of 300 copies per issue. The early history of advertising, together with numerous sample advertisements of this early period, is well presented in Sampson's *History of Advertising*.

The Modern Period may be dated from about 1850. The reason for putting the dividing point between the early and modern periods at 1850 is the rapid appearance of newspapers and magazines, which made possible the development of modern advertising on a large scale. Advertising was impossible until printing developed and until people generally learned to read. One reason for the rapid increase in the number and distribution of advertising media at this time is probably to be found in the development of transportation systems—railways and waterways. Prior to that time railway lines were limited to restricted areas. There was no national transportation system. To illustrate the difficulties of transportation before that time, and even up to 1870 or 1875, we may quote the following announcement of the Kenosha (Wisconsin) *Telegraph* in Rowell's Directory in 1869:—

The town is renowned for the manufacture of wagons, which find a market all the way to the Rocky Mountains, and even to Oregon, being shipped by way of New York.

This shows how difficult it was to distribute goods generally over the country. It is obvious, then, that without the possibility of transporting goods there was no need of advertising media of wide circulation, and furthermore media could not develop a wide circulation because they could not be distributed conveniently or rapidly. During the middle and latter part of the 19th century the development of a national transportation system made possible the ready distribution of goods and publications. About this time also advertising agencies arose whose primary purpose was to serve as brokers of advertising space. They were rather different in this respect from the present advertising agency, which, in addition to contracting for space, is, in its best form, an organization giving expert counsel and service regarding marketing and advertising plans and methods.

During this period the number of magazines and newspapers grew very rapidly, so that in 1861 there were 5,203 magazines, papers and periodicals of all kinds in the United States. Yet advertising was relatively limited as compared with the present day. *Harper's Magazine* had its first advertisement in 1864; *Scribner's* in 1872. Magazine advertising on a large scale did not begin until about 1860 to 1870. It was stated in 1926 that *Harper's Magazine* had approximately as many pages of advertising in one year as it had in its first 24 years. At first it was used chiefly as a medium for advertising the Harper publications. Advertising rates at that time began to assume real proportions. *Harper's Weekly* was receiving \$35 an inch for its back page in the 'sixties.

The first advertising agency was established in Philadelphia in 1840 by Volney B. Palmer. Later, offices were established in Boston and New York. Rates and contracts were not standardized at that time. The agent contracted for a certain amount of

space with a publication and then sold it for whatever he could, receiving sometimes as high as 50% of the cost of the space as his commission. Among the better known early advertising agents were V. B. Palmer, S. M. Pettingill and George P. Rowell. In 1928 the United States had about 1,200 advertising agencies. Some 140, including most of the larger ones, were members of the American Association of Advertising Agencies.

Development of Higher Standards.—Since 1911 advertising has developed most rapidly as a standardized business. It was in that year that definite organized steps were taken to forward the movement of truth in advertising. In 1911 counsel for *Printers' Ink*, a leading advertising journal in the United States, formulated what has become known as "The Printers' Ink Model Statute," which has been adopted in a large number of States. This statute makes dishonest advertising a misdemeanour.

It (a) places the responsibility for deception upon the advertiser, (b) deals with questions of facts about goods rather than opinions and (c) designates the making of untruthful, deceptive or misleading statements a misdemeanour. Up to Feb. 1928 this statute had been adopted in 23 States in substantially the form in which it was originally prepared by counsel for *Printers' Ink*, and in 15 States in modified form.

In these 15 States the modification which was made in the statute consisted for the most part of the insertion of the words "knowingly" or "with fraudulent intent." It is obvious that this change very considerably weakens the force of the statute. Nevertheless, the adoption of this statute has been a powerful force in bringing deception, misrepresentation and dishonesty in advertising under legal control. The Associated Advertising Clubs of the World, now known as the International Advertising Association, the national and local advertising clubs and other organizations have been active in pushing the adoption of this or similar legislation, which has been a powerful influence toward the remedying of objectionable practices. In addition to State legislation a number of larger cities have ordinances intended to check certain undesirable advertising practices.

About 1912, the Associated Advertising Clubs of the World at their annual convention adopted the motto "truth in advertising," and established a National Vigilance committee in the United States, now called the National Better Business commission, with the purpose of forwarding higher standards of honesty and reliability in advertising. This committee organized, in connection with the various local clubs throughout the United States, local vigilance committees or Better Business commissions to eliminate objectionable, untruthful advertising. The purpose of these commissions has been to carry on locally in each city active efforts, similar to those of the national commission, toward the elimination of dishonest and objectionable advertising and related business methods. Up to 1928, such commissions had been established in over 40 cities, including Boston, St. Louis, Cleveland, Indianapolis, Kansas City, Des Moines, Minneapolis, St. Paul, Spokane, Portland, Ore., and New York city.

About this same time the Associated Advertising Clubs of the World undertook definite educational activity in outlining courses of study and discussions to be conducted by the various local clubs, for the purpose of studying advertising methods and of improving them. A distinct service has been rendered in this connection by the several educational activities of the different local organizations. Colleges and universities began to give serious attention to the study of advertising by establishing well-defined courses of instruction.

Facts About Circulations.—In 1914 there was organized the Audit Bureau of Circulations. This has become the leading agency for securing reliable information about the circulation and distribution of publications. The work of this bureau came about as the result of several organizations which were interested in the endeavour to develop a generally acceptable means of obtaining reliable, standardized statements of circulation. It was felt that the time was ripe for devising such means, and that the advertiser had a right to know what he was buying when he bought space in publications. It was desirable to know not only the total circulation but also something about the various aspects of this

circulation, facts which are as important as the statement of the total amount of the circulation.

About 1870 the only facts generally available regarding circulation were the statements in George P. Rowell's *Directory*; and after that time the *Ayer Directory* was the chief source of information. In order to bring about a somewhat more reliable statement of circulations at that time, Rowell added a gold mark to the name of the publication if the publisher made an affidavit concerning his circulation. This was accompanied by an offer of \$100 to anyone who could disprove the claim made. In general, the audit bureau reports attempt to answer three main questions: (a) How large is the circulation? (b) Where does it go? and (c) How was it obtained? The bureau operates by requiring from its publisher members a so-called publisher's statement every six months. The bureau itself makes an audited report once a year.

The Audit Bureau of Circulations became of great value to advertising, because it made available reliable statements of circulation covering many different phases. In case of error, either intentional or unintentional, the bureau established certain rules. In case of error, a publisher or advertiser member of the bureau could ask for a re-audit of any publication, if he so desired. If the re-audit proved that the publisher had misrepresented the facts the expense was to be borne by the publisher. This fact being then bulletined to the other members of the bureau, the publisher became subject to suspension and expulsion from the bureau. Up to Oct. 1927, 186 general magazines and periodicals were members of the bureau, 75 farm publications, 251 business publications and 923 newspapers. In addition to publications, 142 national advertisers, 56 local advertisers and 178 advertising agencies were members.

About 1913 there was organized in the United States the Association of National Advertisers, another important influence in the study and development of advertising practices. Likewise, during that period publishers developed a distinct consciousness of censorship of advertising. A considerable number of publishers took a definite stand with regard to the advertising which they would or would not accept. The announced or stated policy might not be fully lived up to in practice in all instances, but the best evidence of actual progress made in this regard lies in a comparison of the present issues of leading magazines and newspapers with issues of the early years of the century. The improvement is marked. In addition to the elimination of objectionable and doubtful advertising, a considerable number of media went a step further by guaranteeing their advertising in the sense that they would either themselves make good on any misrepresentation or deception which appeared in connection with an advertisement, or would see that the advertiser in question made good. With most of the high-grade media a policy of guaranteeing is substantially implied, and is almost unnecessary in view of the commendable care which is exercised in rejecting questionable commodities or irresponsible business houses.

In 1917 the American Association of Advertising Agencies was organized. It contributed materially toward the establishment of standards of practices and uniform methods of procedure. In 1925 it inaugurated a department of research for studying fundamental problems of advertising and marketing. Finally, and perhaps most important, an increasing use of research methods developed. Here and there these methods appear to be thoroughgoing in finding the facts on which marketing and advertising plans may be based, scientific research and planning taking the place of guesswork.

SUMMARY OF DEVELOPMENTS SINCE 1850

Considering the period since 1850 as a whole, the chief developments, in addition to those mentioned, may be designated as follows:—

Growth in Quantity.—There has been a tremendous growth in the number of firms employing advertising in one form or another. In 1928 there were about 10,000 firms doing some national advertising. The report entitled *Leading Advertisers*, prepared each year by the Curtis Publishing Co., mentions 2,405 firms, which spent \$20,000 in either 1924, 1925 or 1926 in 32

leading national magazines. In this list there were 50 firms which spent \$264,500 or more in 36 leading national publications in 1921. There has been likewise an enormous growth in the number of media. In 1830, it is estimated that there were approximately 800 magazines and newspapers in the United States, of which some 50 were daily publications. Their combined annual circulation was estimated at about 60,000,000 copies, or a circulation of approximately 950,000 copies per issue. In 1830 the total population of the United States was 23,500,000.

In 1861 there were 5,203 papers and magazines for a population of approximately 30,000,000. In 1922 there were 22,128 magazines and newspapers in the United States for a population of about 126,000,000. In other words, there has been an increase of magazines and newspapers since 1861 of approximately 4½ times, whereas the population during the same period of time has increased approximately 4 times; but since 1830 the population has increased approximately 4½ times, while the number of magazines and newspapers has increased almost 30 times. A more striking increase has taken place in the total combined circulation. The estimated combined circulation per issue of the magazines was (1928) approximately 63,000,000 copies, and the total combined circulation of the newspapers approximately 45,000,000. Thus since 1830 there has been a growth in total combined circulation of all magazines and newspapers from less than 1,000,000 to approximately 108,000,000 per issue. Besides the marked increase in the number of media and in the extent of their circulation, there has been an equally marked increase in the amount of advertising carried in a given issue of a publication. Two representative newspapers in the United States show an increase in advertising space of 5 times and 13 times respectively from 1850 to 1918.

During that period, also, there developed entirely new media of advertising, including street-car cards, posters, direct-mail, motion-picture and radio advertising. Street-car advertising did not come into general use until about 1890, when the change was made from horse-drawn cars to electric cars. The mail-order field developed rapidly. Not only did mail-order houses spring up in large numbers during the period, but also business firms of all kinds developed a very extensive use of direct-mail material in the form of circulars, catalogues, letters and so on. The large mail-order houses commonly sent out twice a year upwards of 4,000,000 large catalogues in addition to numerous smaller departmental catalogues issued. Figures obtained in 1920 estimated the total approximate amount spent in direct-mail advertising to be \$300,000,000; in 1928 the amount was greater, probably much greater.

Advance in Quality and Scope.—During the period under consideration there was a distinct improvement in the quality of advertising. Methods of printing, typography, colour printing, art work and the like, greatly advanced. Besides the mechanical improvements there were likewise distinct advances in such essential qualities as accuracy of statement and descriptions, reliability and truthfulness.

A widening of the scope of advertising developed rapidly. There was a marked increase in the variety of advertising used. Perhaps the dominating types of advertising which flourished originally—that is, about the middle and latter half of the 19th century—were patent-medicine advertising and circus bills and in general much unreliable, dishonest and objectionable advertising. As developed there is hardly a business or type of commodity for which the printed word is not used as a means of selling. Banks and financial institutions of high grade turned to advertising, finding it profitable to employ in a dependable manner the methods which had been found profitable by unreliable financial houses. Advertising suffered because of the objectionable features which were so prominent in its earlier development. For this reason, undoubtedly, high-grade financial houses and to some extent other types of business were slow to take advantage of the possibilities which it offered.

Public service institutions use advertising to place themselves before the public in the proper light, to secure the co-operation of the community and to offer their securities to customers and

to others. What is termed institutional or good will advertising is widely used, not only by banking or similar institutions, but by large firms of all kinds, retail stores and manufacturers. Causes of one kind or another—local, national and international—use advertising to secure publicity and to gain adherents. Churches, charitable institutions, schools, educational endowments, public health bureaux, political parties, candidates and even governments find advertising a suitable and dignified means of publicity. In industrial disputes, employers and employees alike use advertising as a means of influencing public opinion, securing sympathy and moral support.

The development of trade marks is likewise a conspicuous characteristic of the periods mentioned, particularly of the first quarter of the 20th century. A large proportion of the trade marks known throughout the United States and all over the world developed during this time. Of the somewhat more than 150,300 valid trade marks registered in the U.S. Patent Office up to 1922 practically none was used prior to 1870, and only a small handful go back to 1885 or 1890. The development of national and international business made trade marks virtually a necessity; and advertising became an important means, perhaps the chief means, of making them known to the public.

Volume of Advertising.—Advertising is playing an important rôle in the operation of business. It is assuming such large proportions that it is difficult to estimate its magnitude and to calculate its exact place in commercial affairs. We may gain some notion of its immense proportions from the amount of money expended and from the amount of space used each year for printed advertising in the United States. It has been estimated that in the neighbourhood of a billion dollars is spent annually for this purpose. Approximately \$500,000 is spent annually for advertising any one of a score or more of well-known commodities, as high as \$3,000,000 and \$4,000,000 being spent in exceptional cases. Or we may gain a concrete idea of the immensity of advertising from the cost of space for single advertisements in some of the leading media. Thus, for example, a page in a well-known monthly magazine in a single issue may cost \$350, and the back outside cover \$800. A page in a well-known weekly publication would run to \$8,000, and the back outside cover \$15,000. A page in the large metropolitan newspapers costs as high as \$1,500 to \$2,000. From still another angle the immensity of advertising is indicated by the fact that from two-thirds to three-fourths of the cost of maintaining a newspaper or a magazine comes from its advertising space.

The outsider naturally wonders whether advertising with such high rates for space can really be a profitable aid in selling; or whether it may not be an expensive luxury indulged in by large business concerns. The extent to which advertising plays a justifiable rôle in the distribution of goods is an important and intricate problem which must be dealt with in any important consideration of the subject.

ADVERTISING IN BUSINESS

There are wastes in advertising, but there are wastes everywhere in production, in distribution, in personal selling. Economy in the distribution side of business has lagged behind, but distinct advances have been made. Probably the chief sources of waste in advertising are:—

(1) The lack of proper co-ordination between advertising and the other phases of a business—lack of co-ordination with distribution, personal sales, plans and production—advertising where there is no distribution, and the like.

(2) The use of inefficient methods—weak, unconvincing and ineffective appeals, poor presentation, ineffective technique, the use of too large space or too small space due to guessing instead of finding the facts on which to build and plan. It has been estimated that if every piece of advertising material were made 10% more effective it would mean a saving of \$100,000,000 to the business interests of the United States.

(3) The use of advertising for commodities in circumstances in which returns are highly uncertain or for business ventures which are too hazardous.

(4) The excessive use of advertising in over-keen competition.

(5) The failure to make all advertising literally truthful and dependable. Even if 96% or 97% of advertising were in the main

trustworthy and meritorious, the remaining 3% or 4% would weaken the effectiveness of the rest.

(6) The use of advertising for illegitimate business, highly speculative investments, financial frauds or for commodities of doubtful value or actually injurious to mankind.

Improvements are proceeding in all these directions. Fundamentally, these sources of waste are not peculiar to advertising, but due to the waste and inefficiency in business as a whole. The same sources of waste exist in oral selling—making plans on guesses instead of on facts, not being literally truthful and dependable in every instance, a lack of proper co-ordination with other phases of a business, the waste of time on the part of salesmen and excessive personal expenditure. Preliminary time studies show that the average salesman uses only about 15% to 50% of his working time in actual selling. Fundamentally these wastes in oral as well as in printed selling are not to be laid upon these two aspects of business, but are due to conditions in business as a whole, to mistaken judgment, to ignorance and moral weakness.

The Case Against Advertising.—The actual total amount of money spent on advertising is large. The probable amount spent in the United States in one year is in the neighbourhood of one billion dollars. The question is, Who pays for it, and how far different would be the price of commodities if this expenditure were entirely eliminated, and in what way would the methods of distribution and the cost of distribution be different? The critic assumes that this money is an economic waste and that prices are higher because of it.

A second argument is that advertising has considerably increased the demand for, and the purchase of, luxuries and semi-luxuries, such as cameras, beverages, automobiles, pianos, phonographs, vacuum cleaners and so on.

A third argument is that advertising has been responsible to a considerable extent for the increasing and widespread use of packages, cartons, wrappers and labels for a large variety of products. Advertising has been responsible to a very large extent for the development of standardized brands and trade-marked articles. These wrappers and containers cost money which supposedly is not a part of the price paid for commodities bought in bulk. The argument is that all of this expenditure is added to the price of the product.

Relative Cost.—It is found that the amount actually spent for advertising specific commodities differs widely from the amount which the average person thinks is spent for advertising specific products. Almost every person who makes a general statement that the prices of commodities are higher because of the advertising, or that the money expended for advertising is wasted, knows little about the actual facts of the relative amount of money expended for advertising a specific commodity. People quite generally have a greatly exaggerated notion of the amount of money spent for printed advertising. An investigation was made to determine the amount which people think is spent for advertising certain commodities. The results of the investigation showed that people generally over-estimate from four to five times the amount spent for advertising specific products. For example, the amount spent for advertising a package of breakfast food retailing at 15 cents was estimated by this representative group of persons as two cents, whereas the actual amount spent by the manufacturer of this food for advertising a single package was three-tenths of a cent, an over-estimation of about eight times. The average person believes that approximately five times as much money is expended for this purpose as is actually the case.

Averages of expenditures for advertising by a considerable number of firms in all lines of business show that actual figures are relatively small. Figures obtained by the Harvard Bureau of Business Research, and based on a considerable number of stores in each case, give the percentages of net sales expended for advertising for the years 1919 and 1920 in several lines of business. The accompanying table furnishes the percentages.

The average expenditure for advertising on the part of retailers is approximately 2% or less. Certain types of stores, in particular department stores, expend over that amount, and, on the other hand, a very considerable proportion of retailers spend under that amount. Figures supplied by reliable sources show that the

AEROPLANE SKY-WRITING OVER LOWER NEW YORK CITY

In making the letters of this advertisement the sky-writer worked at an altitude of 12,000 feet. The letter R is approximately a mile in length and is directly over the City Hall. The estimated length of the five letters of the word is five miles

amount spent by manufacturers for advertising is from 2% to 3%, and that therefore the expenditure for advertising as a whole is probably not over 4% to 5%. It is therefore evident that while the total expenditure for advertising runs into large figures, the relative expenditure in proportion to the cost of a commodity is small. In other words, if advertising played no part whatever in stimulating the sale of commodities, and if the cost of advertising

*Percentages of Net Sales Expended for Advertising,
1919 and 1920, in Retail Stores*

	Common Figure %
General stores	0.2
Retail groceries	0.2
187 Retail drug stores (1919)	0.7
130 Retail shoe stores (1919)	1.3
397 Retail shoe stores (1920)	1.9
182 Retail jewellery stores (1920)	2.0
190 Retail jewellery stores (1921)	2.5
266 Department stores (1920)	2.0
301 Department stores (1921)	2.4

were therefore directly added to the price of a commodity to the consumer, the price of an article would be almost inappreciably higher than it now is. An article selling at \$1.00 would have to be sold at \$1.04 or \$1.05 if advertising were purely a dead expenditure of money. Although the actual expenditure for advertising is relatively small—probably not over 4% to 5% in the aggregate—even this expenditure would be a serious waste if it produced no economic or social value. The 1% to 2% spent by retailers, or the 2% to 3% spent by manufacturers, would in many instances serve to make the difference between success and failure.

Effects of Advertising.—In 1925 a National Distribution Conference was held in Washington under the auspices of the Chamber of Commerce of the United States. The report of the committee appointed to investigate "Market Analysis—Advertising and Advertising Mediums" gives some information with regard to the point just brought up. The investigation consisted of a survey of articles which had appeared in publications, giving specific data about the effects of advertising on costs and prices to the ultimate consumer; and in addition of a questionnaire which was sent out to a group of national advertisers, requesting specific data showing the effects of their advertising on their costs and prices. The results were tabulated and summarized in part as follow:

From the data available it is hardly possible to make a non-disputative demonstration. Nevertheless, we believe that it can safely be said that the use of effective advertising by national distributors as a general rule produces one or more of the following results:—

- (1) Decreases the cost of selling.
- (2) Lowers the cost of production on account of increased volume.
- (3) Lowers prices to the consumer and thereby raises the standard of living.
- (4) As a by-product, aids in the education of the general public.

Data have been obtained from a number of national advertisers to show the effects advertising has had upon the cost of production and the cost of selling, and prices to the consumer. It is realized that changes in business conditions during the past few years and changes in distribution policies within the individual companies make it very difficult to eliminate the variable factors and to prove the effects of advertising. The data which have been collected, however, seemed to indicate conclusively that the first three results named above are brought about by advertising. . . .

In addition to the four results obtained by advertising which have been mentioned above, advertising often has the following beneficial effects for the manufacturer, dealer or consumer:—

- (1) Advertising aids in stabilizing production.
- (2) Advertising aids in standardization and quality.
- (3) Advertising aids in the simplification of products. (Elimination of unnecessary items in the line.)
- (4) Advertising helps to prevent fluctuation in prices.

Summary of Advantages.—A beneficial effect of advertising has been the reduction of seasonal fluctuation in the volume of business. In certain fields of business, the seasonable fluctuation, if not entirely eliminated, has been greatly reduced. The two seasons of buying men's clothing have been greatly extended, and the sale of toys, formerly largely confined to the holiday season, is more evenly distributed throughout the entire year. The same

is true of fountain pens, millinery, arms and ammunition, oranges and lemons and other products. The result has been a reduction in the cost of doing business.

Advertising has aided materially in the standardization of products and quality of goods. This has been brought about through the establishment of brand names and trade marks, which have become associated with uniform quantities and qualities in the mind of the public, until the recollection of a brand name of any number of specific products calls up the picture of a certain definite quantity and a certain recognized standard of quality, which the public has been educated to receive when it calls for a product by a specific trade-name. Although the establishment of standard packages has probably added to the cost of commodities to some extent, it has had certain other advantages. It has facilitated retailing, requiring less time on the part of assistants in the preparation of products for delivery to the consumer, and it has secured a more hygienic handling of goods, particularly foods.

The noteworthy advances made in the general level of living, in public taste, in personal and domestic conveniences, in the general use of cultural agencies, must be attributed in part to the use of the printed word in the form of advertising. Such products as phonographs and radios and the development in musical taste generally, vacuum cleaners, better-fitting clothes, better-constructed and designed houses, better-painted houses, evidence the advance made in the level of living, due in a considerable measure to the insistent and continuous force of advertising. There is no doubt that we should very likely have most if not all of these improvements and conveniences without advertising, but probably not so many people would have had them so soon. Printed publicity has no doubt helped to educate people to want more and better things in food, clothing, housing, personal comfort and enjoyment.

The almost universal reading of magazines and newspapers has been made possible largely, if not solely, through advertising, since approximately three-fourths of the income of a periodical is derived from its advertising space. In this sense, the newspaper or magazine is practically a by-product of advertising. The trifling sum which is now charged for a newspaper or magazine—in comparison with the large sum which such magazine or newspaper would cost if it were not for the advertising which it carries—has made some form of reading matter available to even the poorest classes of persons. Advertising revenue has made possible the large-scale production of newspapers, magazines and periodicals of all kinds, the social and educational value of which is beyond estimate.

It seems to have been found from experience that some products may be sold most economically primarily through personal salesmanship, that some products may be sold to certain classes of people most economically primarily through printed salesmanship, but that probably the great majority of products may be distributed most economically by varied proportions of personal and printed selling. So long as competition is believed to be a desirable factor in human welfare, just so long will competitive means be used. Critics of advertising perhaps may neglect the fact that if advertising were eliminated or abolished other competitive methods would necessarily be substituted for it. If the use of advertising were eliminated, it is quite likely that its place would be taken in most instances by some form of personal selling, with its accompanying expense. The fact that numerous firms which have consistently and continuously used printed salesmanship over a long period of years have survived from early periods of business activity may be taken as some indication that advertising has been found to be a fairly effective agency of business progress. (D. St.)

PSYCHOLOGY OF ADVERTISING

The psychology of advertising embraces the application of modern psychology to the problems of advertising. Every effect has a cause: human behaviour is just as susceptible of interpretation in terms of cause and effect as are the movements of the heavenly bodies. To understand behaviour one needs to understand its causes, and to control behaviour one needs to get control of its

causes. The control of human behaviour in the purchase of goods is the ultimate aim of the advertiser.

Dynamic psychology has disclosed the driving forces of the human machine to be motives, desires, needs and wants. Thus, human beings want food and drink, rest and comfort, protection from danger, comradeship with their fellows, superiority over their rivals, etc. The universal presence of these needs or desires guarantees that only relatively slight stimuli need be applied to set the human being into action in order to satisfy them. The advertiser, knowing these facts, attempts not only to engender action by playing upon these motives through his printed advertising, but also to show that his own product will satisfy a fundamental need *more effectively* than any other competing product. We find, therefore, that such a commodity as a tooth-paste will be offered as a means of satisfying the desire for cleanliness, for beauty, for protection from disease, for prestige, for success in love, or in business. Other things being equal, that commodity which stimulates into action the most powerful motive will win the market. The use of argument and logic plays a minor rôle in successful present-day advertising in comparison with the direct appeal to desire.

After the proper appeal is chosen the advertiser is faced with the necessity of presenting it to his readers most effectively. At every step in this process psychological problems are encountered. For instance, in order to attract and hold attention the advertisement must be different from its neighbours; it must be *distinctive*. Now, distinction of a given amount may be attained in a variety of ways and at varying cost, for example, by the use of a large space or through the use of coloured advertising. But when full-page advertisements are too common, and the use of colour is too nearly universal, both these devices lose their power of grasping the attention. Many other psychological ways of making the appeal effective are known, such as the influence of a pleasant state of mind, however it may be created, upon the memory; the dependence of the comprehension of a printed message upon the intelligence level of its readers; the dependence of the effectiveness of the trade names and trade marks of commodities, of packages and other containers upon the ability of the reader to discriminate between them and those of competitors and imitators. All these matters of attention value, of aesthetic quality, of ease of comprehension, of freedom from confusion with imitations and many others have been measured by methods developed in the psychological laboratory. For instance, an adaptation of the familiar free association test has been employed to measure the influence of years of advertising upon the familiarity of certain commodities, trade names and slogans in the minds of the public. By presenting a series of commodity names to a sampling of consumers with the request that they report the first thing suggested by each, it has been possible not only to determine the relative familiarity of products in the minds of people, but to analyse some of the most important factors that determined their status. On the basis of the intelligence surveys that have been made of the population of the United States, the copy-writer can gauge his copy so as to be intelligible to any desired proportion of the population. It is obvious, for example, that any advertising message that is to reach as many as three-fourths of the people of the United States must be expressed in the simplest possible words, with short uncomplicated sentences and with the use of pictures whenever feasible.

Choice of a Medium and a Product.—The choice of the medium in which the advertisement shall appear, whether it be billboard, newspaper, magazine, theatre programme or handbill, and the position that it shall occupy in that medium is dependent upon such psychological factors as attitude and interest. Is the hurried reader of a morning newspaper in the attitude favourable to the purchase of a given article, or is the reader sitting in a comfortable chair at home in the evening in a more appropriate attitude? What is the most appropriate time and place to make a favourable impression upon the professional man, the financier, the merchant or the labourer?

More fundamental than all of these matters of the choice of an appeal and its presentation is the part that psychology may play in determining the nature of the actual product to be sold. It is, indeed, no longer necessary to guess at the popular taste. It may

be measured upon a sampling of the buying public. The pleasingness of a proposed brand of coffee, a pattern of linoleum, a musical composition or a perfume, as well as the name that shall be given to it, can be, and occasionally is, determined before it is put upon the market through the simple process of taking a census of preferences. The technique of measuring such subjective data as preferences, likes and dislikes, as developed in the psychological laboratory, is simple and applicable to an almost unlimited range of practical business problems.

Experimental Studies of Advertising Psychology.—The earliest studies of advertising problems dealt with attention and how to attract it, as this was considered the primary requisite of successful advertising. Such questions as how big an advertisement should be, how frequently it should be repeated, what colours had greatest attention value, what part of the printed page attracted the most attention were examined in the psychological laboratory (H. Gale, *On the Psychology of Advertising*; *Psychological Studies*, University of Minnesota, 1900). Problems of the memory value of advertising were then attacked as second only in importance to attention value. For this purpose the laboratory methods for measuring recall, recognition and retention were adopted outright, or in slightly modified form (W. D. Scott, *The Theory of Advertising*, 1903, and H. L. Hollingworth, *Advertising and Selling*, 1913). The application of the "order of merit method" of Cattell for measuring the value of a whole advertisement introduced a long series of researches of this nature, which have had a profound effect upon the content of the psychology of advertising (E. K. Strong, *The Relative Merit of Advertisements*, 1911). In recent years more complex and less tangible factors affecting advertising success have been subjected to experiment. For example, the power of the reader to discriminate among various commodities, advertisements, trade names, etc., has been tested with interesting results (R. H. Paynter, *A Psychological Study of Trade-Mark Infringement*, 1920). The feelings and faint emotional states aroused by advertisements and their various components have been measured and evaluated. (See A. T. Poffenberger, *Psychology in Advertising*, chaps. xiv. to xix., 1925.) And finally, attention is being directed to the factors which create and strengthen belief in advertising, such as the effect of exaggeration, of positive and negative suggestion and of the reputation of the advertising medium. Such measuring methods as these, added to a general knowledge of human nature, furnish the means of predicting the success of advertising within a known degree of probability. (A. T. P.)

Colour in Advertising as it is known to-day, began in 1894. The first colour advertisement was for a rug and was printed for one of the large mail order houses. Fusion of colours in printing had only recently been perfected; it was made possible by the half-tone process. (See PRINTING.) The use of colour in advertising did not grow rapidly at first owing to the difficulties of securing a highly surfaced paper, printing inks that would fuse without blotting out certain tones, and printing presses that would give perfect register.

Colour in advertising was first extensively used for posters and street-car cards, and it was not until about 1910 that the printing-press was so improved as to turn out high grade colour work in large quantities, and at a reasonable cost for publications. Colour printing has now become so common that it is found in most of the advertising matter. Even some newspapers have their coloured section. In 1927, 32 of the leading American magazines carried over \$71,800,000 worth of advertising in colour. That amount was about twice as much as was invested in all periodical advertising in America in 1914. The rapid growth in coloured advertising in the last few years, has been partly the result and partly the cause of the very wide adaptation of colour in the home, in dress, in automobiles and even in architecture.

First coloured illustrations were desired to advertise these products in all of their colourful attractiveness. On the other hand, presenting so many different articles in colour set a new standard, speeding and spreading the vogue for iridescent tones where black, white and grey had so long held sway. Much of the early use of colour in advertising was primarily to help catch the attention of

the reader. This, however, did not prove either practical or economical. By laboratory tests it has been shown that the addition of colour to the page adds only about 13% to its attention value. As the printing cost of extra colours is more than 13%, it did not pay.

Colour advertising has been strikingly successful: (1) in portraying goods in their actual colours, (2) in giving various articles a setting of richness and a refined atmosphere, (3) in showing the appearance of the package or container, (4) in reproducing trade-marks or other distinguishing features.

Psychologists state that colour actually has a physiological as well as a psychological effect; e.g., red is irritating as shown by the fact that a red rag waved at a bull or tom-turkey arouses anger. Blue and green are said to be cool colours giving a restful effect. It is also cited that such expressions as "feeling blue," "a drab life," "a grey day," etc., are popular acceptances of the effect of colour upon the mental state. This particular effect of colour has not been very much studied in advertising although it is occasionally observed. Of course red, rather than blue, is used to give the feeling of warmth; and blue, rather than yellow or orange, to give the effect of coolness. This has been observed in the summer and winter resort advertising. However, these are rather exceptional uses of colour in commercial printing. So far, psychologists have not made a sufficiently detailed study of colour so that individual preferences are well established. It is commonly said that women prefer red and men blue and a number of superficial psychological investigations have tended to establish the correctness of this observation especially when applied to dress, but in the selection and sale of merchandise broad generalizations of this nature are regarded as conjectural. Advertisers have not found the public well enough informed as to the traditional significance of the different colours to rely on it as a dependable factor in advertising; e.g., yellow traditionally may be the colour of hope, of light and cheer, of optimism. But to the average consumer it may also be a symbol of age—"the sear and yellow leaf," "yellowed with age," and an indication of independability as "being yellow" or having a "streak of yellow."

Many forms of advertising are chosen because of the possibility of utilizing colour. Certain magazines and periodicals, posters, bulletins, and street-car cards are selected because of the possibilities of employing colour. In posters, painted bulletins and street-car cards approximately 90% of the showings contain colour.

(H. E. A.)

ADVERTISING AGENT or AGENCY, an individual or an organization engaged primarily in the preparation of advertising and also in giving counsel and assistance in the advertising and merchandising of commodities, securities and services. In the United States, where advertising as a business is most highly developed, and where the advertising agent first became a recognized factor in business, the activities of the agent differ considerably. These may be limited to one element of advertising or may embody all phases.

In Great Britain and Australia, on the Continent, and in Latin American countries, the advertising agent confines his services largely to preparing copy, both text and illustrations, and arranging for its publication in whatever medium may be used. In recent years, the services of the advertising agent in Great Britain have developed somewhat along American lines. In the United States and Canada there are about six hundred "recognized" national advertising agents or agencies, and as many more local ones, the majority of which extend their activities to everything which has to do with advertising, including any research neces-

sary to its preparation and any merchandising that may be helpful to make the advertising profitable. An American advertising agent generally undertakes to perform the following work: (a) Conduct marketing researches; (b) Suggest the most saleable form of a product, including the design of the package and determination of price. (c) Assist in the organization and direction of the advertiser's sales force. (d) Prepare the advertising, suggesting the amount of money to be expended, the space required, the mediums to be used and writing and illustrating the copy; also such advertising literature as catalogues, mailing pieces, etc. (e) Make contracts with publishers or the purveyors of advertising space in which the advertisements are published. (f) Assist the advertiser to cultivate the good will of the trade and the public.

As an organization, serving any number of advertisers, the agency (or agent) usually divides itself into departments as follows: (1) Executive, which includes the securing of business and its development. (2) Research and plans, which conducts marketing enquiries and investigations, and plans the extent and character of an advertising campaign. (3) Production, which provides for the writing and illustration of advertising copy, and the preparation of the engraving cuts and mats necessary to mechanical reproduction, and other details. Formerly, the advertising agent was remunerated by means of a commission allowed to him by the publisher. At present, in the United States this commission is credited to the advertiser and the agent is paid by a commission, more or less equivalent, on all advertising placed, and he may also receive extra fees. Certain advertising agents specialize in giving advertising advice and help either regarding the merchandising of a product or the advertising thereof or both. Certain other agents specialize in the preparation and production of advertising copy only. In Great Britain the advertising agent generally obtains his remuneration in the commission allowed by publishers, and in fees for special work. The number of British agencies is about 150.

ADVICE, counsel given after consideration, or information from a distance giving particulars of something prospective (e.g., "advice" of an imminent battle, or of a cargo due). In commerce it is a common word for a formal notice from one person concerned in a transaction to another.

ADVOCATE, a person called in to plead the cause of another; especially one entitled, as having the right of audience, to plead the cause of another in a court of law. In Scotland the word is used particularly to designate a member of the bar of Scotland (see **ADVOCATES, FACULTY OF**). The lord advocate is the chief law officer of the Crown in Scotland. As chief public prosecutor he appoints six members of the bar to be his deputies in the conduct of criminal prosecutions, and they are termed advocate-deputies.

The lawyers who practised in the English courts of common law were never officially known as advocates, the word being reserved for those who practised in the courts of the civil and canon law (see **DOCTORS' COMMONS**). There was formerly an important official termed his majesty's advocate-general, or more shortly, the king's advocate, who was the principal law officer of the crown in the College of Advocates or Doctors' Commons, and in the admiralty and ecclesiastical courts. He discharged for these courts the duties which correspond to those of the solicitor of the treasury (see **SOLICITOR**). His opinion was taken by the foreign office on international matters, and on high ecclesiastical matters he was also consulted; all orders in council were submitted to him for approval. The office may now be said to be obsolete, for after the resignation of Sir Travers Twiss, the last holder, in 1872, it was not filled up. Advocate is also the title still in use in some of the British colonies for the chief law officer of the crown.

In the United States the term advocate has no special significance but is used synonymously with such terms as attorney, counsel or lawyer.

In France, the *avocats*, as a body, were reorganized under the Empire by a decree of Dec. 15, 1810. There is, however, a distinction between *avocats* and *avoués*. The latter, whose number is limited, act as procurators or agents, representing the parties before the tribunals, draft and prepare all formal acts and writings, and prepare lawsuits for the oral debates. The office of the *avocat*, on the other hand, consists in giving advice as to the law, and con-

ducting the causes of his clients by written and oral pleadings. The number of *avocats* is not limited.

In Germany the *advocat* no longer forms a distinct class of lawyer. Since 1879, when a sweeping judicature act (*Deutsche Justizgesetzgebung*) reconstituted the judicial system, the *advocat* in his character of adviser, as distinguished from the *procurator*, who formerly represented the client in the courts, has become merged in the *rechtsanwalt*, who has the dual character of counsellor and pleader.

Advocatus Ecclesiae.—In the middle ages the word *advocatus* was used on the continent as the title of the lay lord charged with the protection and representation in secular matters of an abbey. The office is traceable as early as the beginning of the 5th century in the Roman empire, the churches being allowed to choose *defensores* from the body of advocates to represent them in the courts. In the Frankish kingdom, under the Merovingians, these lay representatives of the churches appear as *agentes*, *defensores* and *advocati*; and under the Carolingians it was made obligatory on bishops, abbots and abbesses to appoint such officials in every county where they held property. The office was not hereditary, the *advocatus* being chosen, either by the abbot alone, or by the abbot and bishop concurrently with the count. The same causes that led to the development of the feudal system also affected the *advocatus*. In times of confusion churches and abbeys needed not so much a legal representative as an armed protector, while as feudal immunities were conceded to the ecclesiastical foundations, these required a representative to defend their rights and to fulfil their secular obligations to the state, e.g., to lead the ecclesiastical levies to war. A new class of *advocatus* thus arose, whose office, commonly rewarded by a grant of land, crystallized into a fief which, like other fiefs, had by the beginning of the 11th century become hereditary.

In France the *advocati* (*avoués*) were of two classes—(1) great barons, who held the advocateship of an abbey or abbeys rather as an office than a fief, though they were indemnified for the protection they afforded by a domain and revenues granted by the abbey: thus the duke of Normandy was *advocatus* of nearly all the abbeys in the duchy; (2) petty seigneurs, who held their *avoueries* as hereditary fiefs and often as their sole means of subsistence. The *avoué* of an abbey, of this class, corresponded to the *vidame* (q.v.) of a bishop. Their function was generally to represent the abbot in his capacity as feudal lord; to act as his representative in the courts of his superior lord; to exercise secular justice in the abbot's name in the abbatial court; to lead the retainers of the abbey to battle under the banner of the patron saint.

The *advocatus* played a more important part in the feudal polity of the Empire and of the Low Countries than in France, where his functions, confined to the protection of the interests of religious houses, were superseded from the 13th century onwards by the growth of the central power and the increasing efficiency of the royal administration. They had, indeed, long ceased to be effective for their original purpose; and from the time when their office became a fief they had taken advantage of their position to pillage and suppress those whom it was their function to defend. The mediaeval records, not in France only, are full of complaints by abbots of their usurpations, exactions and acts of violence.

In England *advocatus* was never used to denote the representative of an abbot; but in some of the larger abbeys there were hereditary stewards whose functions and privileges were not dissimilar to those of the continental *advocati*. The word *advocatus*, however, was in constant use in England to denote the patron of an ecclesiastical benefice, whose sole right of any importance was an hereditary one of presenting a parson to the bishop for institution. In this way the hereditary right of presentation to a benefice came to be called in English an "advowson" (*advocatio*).

In Germany the title of *advocatus* (*Vogt*) was given not only to the *advocati* of churches and abbeys, but to the officials appointed, early in the middle ages, by the emperor to administer their immediate domains, in contradistinction to the counts, who had become hereditary princes of the empire. The territory so administered was known as *Vogtland* (*terra advocatorum*), a name still sometimes employed to designate the strip of country which

embraces the principalities of Reuss and adjacent portions of Saxony, Prussia and Bavaria. These imperial *advocati* tended in their turn to become hereditary. Sometimes the emperor himself assumed the title of *Vogt* of some particular part of his immediate domain. In the Netherlands as well as in Germany *advocati* were often appointed in the cities, by the overlord or by the emperor, sometimes to take the place of the bailiff (Ger. *Schultheiss*, Dutch *schout*, Lat. *scultetus*), sometimes alongside this official.

See Du Cange, *Glossarium* (ed. 1882-87, Niort), s. "Advocati"; A. Luchaire, *Manuel des institutions françaises* (1892); Herzog-Hauck, *Realencyklopädie* (ed. Leipzig, 1896), s. "Advocatus ecclesiae," where further references will be found.

ADVOCATES, FACULTY OF, the collective term employed to designate the members of the bar of Scotland. The faculty has grown out of the Scots act of 1532, which established the College of Justice, or Court of Session, in Scotland. The advocates had, and still have, the sole right of audience in the Court of Session and High Court of Justiciary. By immemorial custom, they have formed themselves into a self-governing faculty under annually elected office-bearers consisting of the dean of faculty and his council, the vice-dean, the treasurer and the clerk. When properly instructed by a law agent an advocate is, under pain of deprivation of office, bound and entitled to plead in any court in Scotland, civil or criminal, superior or inferior. He is also entitled to plead before the House of Lords, the judicial committee of the privy council and parliamentary committees. The magnificent library collected by the faculty has now been formed into the National Library of Scotland.

ADVOCATUS DIABOLI, devil's advocate, the popular name for the promoter of the Faith (*promotor fidei*), an officer of the Sacred Congregation of Rites at Rome, whose duty is to prepare all possible arguments against the beatification or canonization of an alleged saint. This functionary first occurs in connection with the beatification of St. Lorenzo Giustiniani under Leo X. (1513-21). (See CANONIZATION.)

ADVOWSON, the right of presentation to a vacant ecclesiastical benefice, so called because the patron defends or advocates the claims of the person whom he presents, or because he is the advocate, patron or defender of the church and benefice and is as such given the right to name the priest. At what period the right of advowson arose is uncertain; it was probably the result of gradual growth. The earliest trace of the practice is found in the decree of the council of Orange, A.D. 441, which allowed a bishop, who had built a church in the diocese of another bishop, to nominate the clerk, but not to consecrate the church. The 123rd Novel of Justinian, promulgated about the end of the 5th century, decreed "that if any man should erect an oratory, and desire to present a clerk thereto by himself or his heirs, if they furnish a competency for his livelihood, and nominate to the bishop such as are worthy, they may be ordained." The 57th Novel empowered the bishop to examine them and judge of their qualifications, and, where those were sufficient, obliged him to admit the clerk. In England, for quite two centuries after its conversion, the clergy administered only *pro tempore* in the parochial churches, receiving their maintenance from the cathedral church, all the appointments within the diocese lying with the bishop. But in order to promote the building and endowment of parochial churches, those who had contributed to their erection either by a grant of land, by building or by endowment, became entitled to present a clerk of their own choice to the bishop, who was invested with the revenues derived from such contribution. After the Norman Conquest, it became quite usual for patrons to appoint to livings not only without the consent, but even against the will, of the bishops.

Advowsons are divided into two kinds, *appendant* and *in gross*. The right of presenting, originally given to the person who built or endowed the church, gradually became annexed to the manor in which it was built, and where the right of advowson remains attached to the manor, it is called an advowson *appendant*, and passes with the estate by inheritance or sale without any special conveyance. But where, as is now generally the case, the right of presentation has been sold by itself, and so separated from the

manor, it is called an advowson *in gross*. An advowson may also be partly *appendant*, and partly *in gross*; e.g., if an owner granted to another every second presentment, the advowson would be *appendant* for the grantor's turn and *in gross* for the grantee's.

Advowsons are further distinguished into *presentative* and *collative*. In a *presentative* advowson, the patron presents a clergyman to the bishop, with the petition that he be instituted into the vacant living, and the bishop then, if the presentee be a fit clerk, admits and institutes him. In a *collative* advowson the bishop is himself the patron, either in his own right or in the right of the proper patron, which has lapsed to him through not being exercised within the statutory period of six months after the vacancy occurred. Collation takes the place of presentation, admission and institution. Before 1898 there were also *donative* advowsons, but the Benefices Act, 1898, made all donations with cure of souls *presentative*. In a *donative* advowson, the patron conferred the benefice by a simple letter of gift, without any reference to the bishop.

The Benefices Act of 1898 did not make any substantial change in the legal character of advowsons, which remain practically the same as before the act. Briefly, it prevents the dealing with the right of presentation as a thing apart from the advowson itself; increases the power of the bishops to refuse the presentation of unfit persons, and removes various abuses. An advowson may, still, be sold during a vacancy, but that will not carry the right to present on the vacancy. But under the Benefices Act, advowsons may not be sold by public auction except in conjunction with landed property adjacent to the benefice; transfers of patronage must be registered in the registry of the diocese, and no such transfers can be made within 12 months after the last admission or institution to the benefice. Restrictions have also been imposed on the transfer of patronage of churches built under the Church Building acts and New Parishes acts, and on that of benefices in the gift of the lord chancellor, and sold by him in order to augment others; but agreements may be made as to the patronage of such churches in favour of persons who have contributed to their building or enlargement without being void for simony.

The Benefices Act, 1898 (Amendment) Measure, 1923, provides that after two further vacancies of the benefice subsequent to the passing of the measure, the right of patronage shall become incapable of sale, and that a patron may anticipate the two avoidances by a registered declaration, and declare the patronage shall from the date of declaration be without power of sale. The measure further provides that if a right of patronage becomes after the date of the measure vested in a clergyman or his wife, or in someone on his or her behalf, that clergyman shall not be presented to the living. There is a further provision in the measure, repealing the act called the Clergy Resignation Bonds Act, 1828, which sanctioned the giving by presentees of a bond to a patron that he would resign the benefice in favour of any one named person, or either of two named persons, if both were related to the patron within certain limited degrees.

The right of presentation may be exercised by the owners, whether they be infants, executors, trustees, coparceners (who, if they cannot agree, present in turn in order of age) or mortgagees (who must present the nominee¹ of the mortgagor), or a bankrupt (who, although the advowson belongs to his creditors, yet has the right to *present* to a vacancy). Certain owners of advowsons are temporarily or permanently disabled from exercising the right, which devolves upon other persons; and the Crown as patron paramount of all benefices can fill all churches not regularly filled by other patrons. It thus presents to all vacancies caused by simoniacal presentations, or by the incumbent having been presented to a bishopric or in benefices belonging to a bishopric when the see is vacant by the bishop's death, translation or deprivation. Where a presentation belongs to a lunatic, the lord chancellor presents for him. Where it belongs to a Roman Catholic the right is exercised in his behalf by the University of Oxford

¹A *nomination* is to be distinguished from a *presentation*. The latter is the legal act, which alone will be recognized by the bishop. But if the legal patron be not entitled in equity, the true patron nominates him.

if the benefice be situate south of the River Trent, and by that of Cambridge if it be north of that river. (For the conditions which make a fit clerk see the article BENEFICE.) If the bishop refuses to admit and institute, the patron has his remedy by an action called after the words in the ancient writ *Quare impedit*; that is, the bishop is called upon to show "why he hinders" the patron in the exercise of his right. If the bishop's refusal be due to the fact that there is another claimant to the patronage, that person is also made defendant. If the refusal be because the clerk is alleged to be unfit, the clerk can himself appeal to the court of the metropolitan by a process known as *duplex querela*. The Benefices act also gives to both patron and presentee an alternative mode of appeal against a bishop's refusal to institute or admit, except on a ground of doctrine or ritual, to a court composed of the archbishop of the province and a judge of the high court nominated for that purpose by the lord chancellor, a course which, however, bars resort being had to the ordinary suits of *duplex querela* or action of *quare impedit*.

In case of refusal of one presentee, the patron may present another so long as he does it before lapse.

Upon institution the church is full against everybody except the Crown, and after six months' peaceable possession the clerk is secured in possession of the benefice, even though he may have been presented by a person who is not the proper patron. The true patron can, however, exercise his right to present at the next vacancy, and can recover the advowson from an usurper at any time within three successive incumbencies so created adversely to his right, or within 60 years. Collation, which otherwise corresponds to institution, does not make the church full, and the true patron can dispossess the clerk. Possession of the benefice is completed by induction, which makes the church full against any one, including the Crown. If the proper patron fails to exercise his right within six calendar months from the vacancy, the right devolves or lapses to the next superior patron; e.g., from an ordinary patron to the bishop, and if he makes similar default to the archbishop, and from him on similar default to the Crown. If a bishopric becomes vacant after a lapse has accrued to it, the right goes to the metropolitan; but in case of a vacancy of a benefice during the vacancy of the see the Crown presents. Until the right of presentation so accruing to a bishop or archbishop is exercised, the patron can still effectually present but not if lapse has gone to the Crown. (See also BENEFICE; GLEBE; INCUMBENT; RECTOR; VICAR.)

See J. Mirehouse, *On Advowson* (1824); Phillimore, *Ecclesiastical Law*; J. Bingham, *Origines Ecclesiasticae, or, the Antiquities of the English Church* (1838-40). (P.)

ADWAN, a Moabite tribe claiming an Arabian origin. They declare that ten generations ago they formed part of a settled population in a fertile district of Arabia and were driven out by invaders much stronger in numbers.

See *The Cambridge Ancient History*, vol. i., 2nd ed. (1924).

ADY, ENDRE (1877-1919), Hungarian poet, was born Nov. 21, 1877, at Ermszent, Transylvania. He was a leader of the modern school and one of the greatest lyrical poets of Hungary. During his youth he became intimate with the publicists and politicians of the Radical and Socialist parties. When he settled down in Budapest he turned his attention towards revolutionary politics and contributed to several Radical papers. He also made prolonged visits to Paris and the Riviera but returned finally to Hungary owing to ill-health, and lived there quietly until his death on Jan. 27, 1919. During the World War he adopted a pacifist attitude, and prophesied the Karolyi revolution of 1918.

BIBLIOGRAPHY.—Jean Horvath, *Ady* (1910); L. Hatvany, *Das verwundete Land* (1921); Paul Gulyas, *Ady* (1925); articles in the *Revue de Genève* (1921-24).

ADYE, SIR JOHN MILLER (1819-1900), British general, son of Major James P. Adye, was born at Sevenoaks, Kent, on Nov. 1, 1819, and died on Aug. 26, 1900. Sir John Adye served in the Crimean War, in the Indian Mutiny, on the North-West frontier in India in 1863 and subsequently in important commands at home. In 1882 he was chief of staff and second in command of the expedition to Egypt and served throughout the

campaign (G. C. B. and thanks of parliament). He held the government of Gibraltar from 1883 to 1886. Promoted general and colonel commandant of the Royal Artillery in 1884, he retired in 1886. He unsuccessfully contested Bath in the Liberal interest in 1892. He was author of *Recollections of a Military Life* (1895) and other works.

ADYTUM, the most sacred part of a shrine, temple or church such as the Holy of Holies of the Temple at Jerusalem, or the cave of the Oracle of Apollo at Delphi, occasionally used for the chancel (*q.v.*) of a Christian church.

ADZE, a tool used for cutting and planing. It is somewhat like an axe reversed, the edge of the blade curving inward and placed at right angles to the handle. This shape is most suitable for planing uneven timber, as inequalities are "hooked off" by the curved blade. At the same time, each cut of the adze leaves its own facet, giving a peculiarly wrought effect to work so finished. The beams of old houses, or of new ones finished in an old-fashioned way, show most pleasantly the marks of the adze. See TOOL.

CARPENTER'S ADZE. TOOL WITH RAZOR-LIKE EDGE WHICH IS USED FOR CUTTING AND PLANING

ADZHAR, an autonomous socialist soviet republic, a zone under the protection of the Georgian S.S.R. Its boundaries are, on the west, the Black sea, on the south, Turkey, on the north and east, the Georgian S.S.R. Area 1,328sq.km.; pop. (1926) 128,553: urban 47,241 and rural 81,312. It consists mainly of the former military Government of Batum with Ardvin, *i.e.*, the slopes and a portion of the Armenian highlands, drained by the Chorokh river and its tributary the Adzharis-Tsakhali, forming deep, picturesque ravines. It is divided for administrative purposes into the following provinces: Adzhar-Tskalsk, pop. 5,524, entirely rural; Kedsk, pop. 10,307, entirely rural; Kobyletsk, pop. 16,996: urban, 1,791, rural, 15,205; Khylosk, pop. 27,172, entirely rural; Chorokh, pop. 59,199: urban, 45,450, rural, 13,749. The climate is "west coast Mediterranean" in type, with southerly and south-easterly rain-bearing winter winds from the low pressure systems over the Black sea. The Caucasus shelters it from north and north-east winds. Rainfall averages 60in. per annum or more—at Batum 93.3in. (maximum in November); average temperature January, 43.0° F.; August, 73.8° F. Malaria is prevalent and insect pests, *e.g.*, mosquitoes and locusts, abound. Along the coastal plains from Batum northwards are cultivated vine, peach, pomegranate, fig, olive (up to 1,500ft. above sea-level), chestnut, apricot, citrus fruits, apple, pear, plum, cherry, melon and tea, maize (the staple food), wheat (up to 5,000ft.), potatoes, peas, currants, cotton, rice, colza, tobacco, sunflower seeds and barley. The eucalyptus, mulberry (with silk cultivation), bamboo and ramie are also produced. Much of the republic is forested; the mountain slopes bearing dense forests with a great variety of timber, interspersed with climbing and twining plants and along the plains and lower slopes flowering shrubs bloom, *e.g.*, magnolia, azalea, camellia japonica, begonia. Petroleum exists north of Batum, but is not worked much. Batum (*q.v.*) is the chief city and port and is linked by rail with Baku (on Caspian) and with Kutais and Poti. Pipes also convey petroleum from Baku to Batum.

A. E.: see RUSSELL, GEORGE WILLIAM.

AEACUS, in Greek legend, was the son of Zeus, and of Aegina, daughter of the river-god Asopus. His mother was carried off by Zeus to the island of Oenone, afterwards called by her name. The island having been depopulated by a pestilence, Zeus changed the ants upon it into human beings (Ovid, *Met.*, vii. 520), who were called Myrmidones (*murmēkes* = ants). Aeacus ruled so impartially that after his death he was made judge of the lower world, together with Minos and Rhadamanthus. His successful prayer to Zeus for rain at a time of drought was commemorated by a temple at Aegina (Pausanias ii. 29), where a festival (*Aiakeia*) was held in his honour.

AECLANUM, an ancient town of Samnium, Italy, 15m. E.-S.E. of Beneventum, on the Via Appia (near modern Mirabella).

It became the chief town of the Hirpini after Beneventum had become a Roman colony. Sulla captured it in 89 B.C. by setting on fire its wooden breastwork, and new fortifications were erected. Hadrian, who repaired the Via Appia from Beneventum to this point, made it a colony; it has ruins of city walls, aqueduct, baths and amphitheatre; nearly 400 inscriptions have been found. Two different routes to Apulia diverged at this point, one (Via Aurelia Aeclanensis) leading through the modern Ariano to Herdonie, the other (the Via Appia of the Empire) passing the Lacus Ampsanctus and going on to Aquilonia and Venusia.

See Ashby and Gardner, *Papers of the British School at Rome*, viii. 108 sqq.

AEDESIUS (d. A.D. 355), Neoplatonist philosopher, was born of a noble Cappadocian family. He migrated to Syria, attracted by the lectures of Iamblichus, whose disciple he became. He taught at Pergamum, his chief disciples being Eusebius and Maximus.

See Ritter and Preller, 552; Ritter's *Geschichte der Philosophie*; T. Whittaker, *The Neoplatonists* (1901).

AEDICULA, a small house or temple, especially the Roman household shrine of the Lares and Penates.

AEDILES, the magistrates at Rome who had care of the temples (*aedes*). Created in the same year as the tribunes of the people (494 B.C.), they were plebeians, elected, two in number, by the *Concilium Plebis*. Intended as assistants to the tribunes, they exercised police functions and had power to inflict fines. They also managed the plebeian and Roman games. In 367 B.C. an extra day was added to the Roman games. The patricians offered to bear the expense if admitted to the aedileship. Accordingly two "curule" aediles (*see* CURULE) were appointed by the *Comitia Tributa*, at first patricians, then patricians and plebeians in turn and lastly from either class. They managed the Roman and Megalesian games, cared for the patrician temples and issued edicts for the markets. The curule aediles ranked higher than the plebeian, but in time their functions became practically identical.

These functions fell under three heads: (1) Care of the city—repair, etc., of temples, sewers and aqueducts; traffic regulation and precautions against fire; control of baths and taverns, and general supervision of public morals. (2) Care of provisions—testing of quality and of weights and measures; purchase of corn for disposal in emergencies at a low price. (3) Care of the games—organization of the public games and control of those given by private individuals (*e.g.* at funerals). These were often used by ambitious persons as a means of gaining popularity.

In 44 B.C. Caesar added two patrician aediles, called *Cereales*, for the care of the corn supply. Under Augustus the juridical functions of the office and the care of the games were transferred to the praetor, while its city responsibilities were limited by the appointment of a *praefectus urbi*. In the 3rd century A.D. it disappeared altogether.

See W. E. Heitland, *The Roman Republic* (1923), pp. 157–158; J. E. Sandys, *Companion to Latin Studies* (1921) (useful bibliography), pp. 321, 345, 385; A. H. J. Greenidge, *Roman Public Life* (1901).

AEDUI (i-dōō-ē), HAEDUI or HEDUI, a Gallic people of Gallia Lugdunensis, who inhabited the country between the Arar (Saône) and Liger (Loire). Their territory thus included the greater part of the modern departments of Saône-et-Loire, Côte d'Or and Nièvre. According to Livy (v. 34), they took part in the expedition of Bellovesus into Italy in the 6th century B.C. Before Caesar's time they had attached themselves to the Romans, and were honoured with the title of brothers and kinsmen of the Roman people. When the Sequani (*q.v.*), their neighbours on the other side of the Arar, subjugated them, the Aedui sent Divitiacus, the druid, to Rome to appeal for help, but his mission was unsuccessful. On his arrival in Gaul (58 B.C.), Caesar restored their independence. In spite of this, the Aedui joined the Gallic coalition against Caesar (*B.G.* vii. 42), but after the surrender of Vercingetorix at Alesia (*q.v.*) were glad to return to their allegiance. Augustus dismantled their native capital Bibracte (*q.v.*) on Mont Beuvray, and substituted a new town with a

SKETCH MAP OF THE AREA OF AEGEAN CIVILIZATION

The map shows both modern and classical names. The chief centres of Aegean civilization were in Crete and in the Peloponnese, but its influence extended over a much greater area, including the Aegean islands and parts of the coast of Asia Minor. Its middle period may, with some confidence, be placed 2,000 years before Christ, and its duration covered at least 3,000 years.

half-Roman, half-Gaulish name, Augustodunum (mod. Autun). During the reign of Tiberius (A.D. 21), they revolted and seized Augustodunum, but were soon put down (Tacitus, *Ann.* iii. 43-46). The Aedui were the first of the Gauls to receive from the Emperor Claudius the distinction of the *ius honorum*. See *MUNICIPIUM*.

See A. E. Desjardins, *Géographie de la Gaule* ii. (1876-93); T. R. Holmes, *Caesar's Conquest of Gaul* (1899).

AEGADIAN ISLANDS (Ital. *ISOLE EGADI*; anc. *AEGATES INSULAE*), small mountainous islands off the west coast of Sicily, scene of the defeat of the Carthaginian fleet by C. Lutatus Catulus in 241 B.C., which ended the First Punic War. Favignana (Aegusa), the largest (pop. 5,828 in 1921), lies 10 m. S.W. of Trapani; Levanzo (Phorbantia) 8 m. W.; Maritimo, the ancient *Ἰερά νῆσος*, 15 m. W. of Trapani, is now reckoned in the group.

AEGEAN CIVILIZATION, the general term for the prehistoric civilization, previously called "Mycenaean" because its existence was first brought to popular notice by Heinrich Schliemann's excavations at Mycenae in 1876, or "Minoan" when Sir Arthur Evans' explorations in Crete from 1899 onwards showed its main source. Subsequent discoveries, however, have made it clear that Crete was its chief centre in its earlier stages, and Mycenae, or the mainland at least, in its later stages; and, accordingly, it is more usual now to adopt a wider geographical title for this culture, which is that of Greece and the Aegean basin in the bronze age.

I. HISTORY OF DISCOVERY AND DISTRIBUTION OF REMAINS

Mycenae and Tiryns are the two principal sites on which evidence of a prehistoric civilization was remarked by the classical Greeks. The Cyclopean walls of the citadel of Mycenae, its gate with heraldic lions, the great "treasury of Atreus" and the galleries of Tiryns had borne silent witness for ages before Schliemann's time; but they were supposed only to speak to the Homeric, or at farthest a rude Heroic beginning of purely Hellenic, civilization. Only when Schliemann exposed the contents of the graves which lay just inside the gate (see *MYCENAE*), scholars recognized the advanced stage of art to which prehistoric dwellers in the Mycenaean citadel had attained. A good deal of other evidence was available before 1876, but had not been collated and seriously studied. Although it was recognized that certain tributaries, represented, e.g., in the 18th dynasty tomb of Rekhmara at Egyptian Thebes as bearing vases of peculiar forms,

were of some Mediterranean race, neither their precise habitat nor the degree of their civilization could be determined while so few actual prehistoric remains were known in the Mediterranean lands. Nor did the Aegean objects which were lying obscurely in museums in 1870, or thereabouts, provide a sufficient test of the real basis underlying the Hellenic myths of the Argolid, the Troad and Crete, to cause these to be taken seriously. Both at Sévres and Neuchâtel Aegean vases had been exhibited since about 1840, the provenance being in the one case Phylakope in Melos, in the other Cephalonia. Ludwig Ross, by his explorations in the Greek islands from 1835 onwards, called attention to certain early intaglios, since known as "island gems"; but it was not till 1878 that C. T. Newton demonstrated these to be no strayed Phoenician products. In 1866 primitive structures were discovered in the island of Therasia by quarrymen extracting pozzolana for the Suez canal works; and when this discovery was followed up on the neighbouring Santorin (Thera), by representatives of the French school at Athens, much pottery of a class now known to belong to the transition from the middle to the late bronze age, and many stone and metal objects, were found and dated by the geologist Fouqué, somewhat arbitrarily, to 2000 B.C., by consideration of the superincumbent eruptive stratum. Meanwhile, in 1868, tombs at Ialysus in Rhodes had yielded to M. A. Biliotti many fine painted vases of styles which were called later the 3rd and 4th "Mycenaean"; but these, bought by John Ruskin, and presented to the British Museum, were supposed to be of some local Asiatic fabric of uncertain date.

Schliemann's Excavations.—Even H. Schliemann's first excavations at Hissarlik in the Troad did not excite astonishment. But the "Burnt City" of his second stratum, revealed in 1873, with its fortifications and vases, and a hoard of gold, silver and bronze objects, which the discoverer connected with it, began to arouse a curiosity which was destined to spread far. As soon as Schliemann came on the royal "shaft graves" at Mycenae three years later, light poured from all sides on the prehistoric period of Greece. The character of both the fabric and the decoration of the Mycenaean objects was not that of any well-known art. A wide range in space was proved by the identification of the island gems and the Ialysus vases with the new style, and a wide range in time by collation of the earlier Theraean and Hissarlik discoveries. A relation between objects of art described by Homer and the Mycenaean treasures was generally allowed, and a correct opinion prevailed that, while certainly posterior, the civilization

of the *Iliad* was reminiscent of the Mycenaean. Schliemann got to work again at Hissarlik in 1878, and greatly increased our knowledge of the lower strata, but did not recognize the Aegean remains in his "Lydian" city of the 6th stratum, which were not to be fully revealed till Dörpfeld resumed the work at Hissarlik in 1892 after the first explorer's death. But by laying bare in 1884 the upper stratum of remains on the rock of Tiryns (*q.v.*), Schliemann made a contribution to our knowledge of prehistoric domestic life which was amplified two years later by Chr. Tsountas's discovery of a similar palace at Mycenae. Work at Tiryns was not resumed till 1905, when it was proved, as had long been suspected, that earlier strata dating back to the beginning of the bronze age lie below the palace cleared by Schliemann. From 1877 dates the finding of Mycenaean sepulchres outside the Argolid, from which, and from the continuation of Tsountas's exploration of the buildings and lesser graves at Mycenae, a large treasure, independent of Schliemann's princely gift, has been gathered into the National museum at Athens.

Between this date and the end of the century many isolated tombs of the beehive type and cemeteries of rectangular rock-cut chamber tombs were explored in different districts of Greece. Chamber tombs were found in Attica, at Spata, Markopoulo and Alyke, and in Argolis at Nauplia, and near the Argive Heraeum, and some late graves in Salamis. Beehive tombs, already rifled, but retaining some of their furniture, were excavated at Dimeni in Thessaly, Menidi and Thoricus in Attica, Orchomenus in Boeotia, and Kampos in Laconia. The richest tomb of all was cleared at Vaphio in Laconia in 1889, and this produced, in addition to a fine series of engraved gems and miscellaneous goldsmith's work, two splendid golden cups chased with scenes of bull hunting, and fragments of large vases painted in a bold florid style. These latter, with similar fragments from the Argive Heraeum, Thoricus, and Mycenae itself, remained an enigma till the excavation of Cnossus revealed the "Palace" style. The exploration of famous classical sites showed too that many of these, with the notable exception of Olympia, had been important centres of culture in Aegean times. Thus the sanctuary at Delphi, the Heraeum by Argos and the Acropolis of Athens all yielded their quota of what were still called Mycenaean objects and the last site boasts a fortification wall similar in style to those of Mycenae and Tiryns with column bases and foundations of a "palace." A Cyclopean acropolis and "palace" were explored on the island of Goulas in Lake Copais, the prehistoric dykes of which were now surveyed. Mycenaean remains came to light in most parts of Greece, but except for Eleusis, Aegina and Thoricus, where little was done, no inhabited sites were touched. At these last three sites pottery of new types was found which we now know to be pre-Mycenaean; but this and the discovery by Wide in 1894 in a barrow at Aphidna of burials containing similar wares remained almost unnoticed. Similarly some early rock-cut tombs with peculiar hand-made pottery found in the American excavations at Corinth in 1896 did not fall into their right context till the discoveries at Korakou, near Corinth, almost 20 years later.

Excavation Outside Greece.—Meanwhile prehistoric research had begun to extend beyond the Greek mainland. Certain central Aegean islands, Antiparos, Ios, Amorgos, Syros and Siphnos, were all found to be singularly rich in evidence of the early Aegean period. The series of Syran-built graves, containing crouching corpses, is the most representative known in the Aegean. Exceptionally rich cemeteries of the same date have been explored in Naxos, and Paros has yielded in addition to early graves some remains of the middle period. Delos too has proved an unexpected source of early Aegean culture. Melos, long marked as a source of early objects, but not systematically excavated till taken in hand by the British school at Athens in 1896, yielded at Phylacope remains of all the Aegean periods, except the Neolithic. Numerous cemeteries with late Aegean pottery have been found in Rhodes. A map of Cyprus in the later Bronze Age (such as is given by J. L. Myres and M. O. Richter in *Catalogue of the Cyprus Museum*) shows more than 25 settlements in and about the Mesaoréa district alone, of which one, that at Enkomi, near the site of Salamis, has yielded the richest Aegean treasure in precious

metal found outside Argolis. E. Gjerstad (*Studies on Prehistoric Cyprus*) has since added to the number of prehistoric sites in the island, the relationship of which to the general Aegean culture is gradually becoming clearer. In Asia Minor a cemetery at Yortan in Mysia and Korte's excavations at Gordium in Phrygia have yielded pottery similar to that from the early strata of Hissarlik. Exploration of south-western Asia Minor has also brought to light remains of the prehistoric age; but though pottery of late Aegean style is found along the coast and ceramic specimens of Aegean appearance have often been brought back from many districts of Anatolia, the connections of Asia Minor and of Hissarlik (Troy) still seem, so far as the early and middle Aegean periods are concerned, to lie outside the Aegean area proper (*see TROAD*). In Egypt in 1887 W. M. F. Petrie found painted sherds of Cretan style at Kahun in the Fayum, and farther up the Nile, at Tell el-Amarna, chanced on bits of no fewer than 800 Aegean vases in 1889. Much material from subsequent excavations has accumulated to demonstrate that Egypt and the Aegean were in contact from early dynastic times. There have now been recognized in the collections at Cairo, Florence, London, Paris and Bologna several Egyptian imitations of the Aegean style which can be set off against the many debts which the centres of Aegean culture owed to Egypt. Two Aegean vases were found at Sidon in 1885, and many fragments of Aegean and especially Cypriote pottery have been turned up during recent excavations of sites in Philistia and Palestine. Indeed the typical Philistine pottery is derived from the latest Aegean fabric. South-eastern Sicily, ever since P. Orsi excavated the Sicel cemetery near Lentini in 1877, has proved a mine of early remains, among which appear in regular succession Aegean decorative motives from the period of the second stratum at Hissarlik. Vases of the last Aegean period have also been found. Aegean objects too have been reported from Sardinia, although the Aegean influence formerly thought to have been observed in Spain, is now discredited or at least considered much overrated.

One land, however, has eclipsed all others in the Aegean by the wealth of its remains of all the prehistoric ages; viz., Crete, so much so that, for the present, we must regard it as the fountain-head of Aegean civilization, and probably for long its political and social centre. The island first attracted the notice of archaeologists by the remarkable archaic Greek bronzes found in a cave on Mt. Ida in 1885, as well as by epigraphic monuments such as the famous law of Gortyna; but the first undoubted Aegean remains reported from it were a few objects extracted from Cnossus by Minos Kalokairinos of Candia in 1878. These were followed by important discoveries made in the southern plain (Messará) by F. Halbherr. W. J. Stillman and H. Schliemann both made unsuccessful attempts at Cnossus, and A. J. Evans, coming on the scene in 1893, travelled in succeeding years about the island picking up trifles of unconsidered evidence, which gradually convinced him that greater things would eventually be found. He obtained enough to enable him to forecast the discovery of written characters, till then not suspected in Aegean civilization. The revolution of 1897-98 opened the door to wider knowledge, and much exploration has ensued, for which *see CRETE*.

Further Mycenaean Investigations.—The success of the excavations in Crete naturally caused fresh attention to be paid to Mycenaean remains on the mainland. At Thebes the ruins of the "House of Cadmus" were found by Keramopoullos and yielded many fragments of brilliant frescoes and a store of inscribed vases of the latest period; while close to the city, chamber tombs, stored with vases and other funeral furniture, were excavated. At Orchomenos the Mycenaean stratum was explored by Furtwängler and the underlying strata, which reach down to the neolithic deposits, began to reveal for the first time the pre-Mycenaean history of the mainland. Wares of the early and middle Aegean periods were unearthed at Aegina and the later continuance of the work there has much enlarged our knowledge and shown that the town was protected by a wall. Imported Cretan ware of the middle period has also come to light. At Tiryns many fragments of frescoes from the palace were found, and in the strata beneath the palace floor, reaching down to bed rock,

7. Minyan goblet from Lianokladi
8. Early Cycladic sauceboat
9. Middle Helladic dish from Mycenae
10. Queen's cup in gold, silver and niello belonging to Professor Persson

remains of the middle and early periods appeared. Further beehive tombs were excavated at Kakovatos at the Messenian Pylos and at Tiryns, but the last had unfortunately been completely plundered at least by Roman times. More evidence for the last period came in from Argos, where the middle period also appeared, Achaea, Aetolia, Locris, and Cephalonia showing that culture all over Greece in the late bronze age had been more or less uniform.

Meanwhile in Thessaly discoveries were being made which were to give a new aspect to the pre-history of Greece. Here rich deposits of painted neolithic pottery were found at Dimini and Sesklo by Tsountas, who cleared some small beehive tombs of the transitional period between the bronze and iron ages at Marmariane. Further systematic excavation of other sites in Thessaly by British archaeologists and researches by Soteriades in Boeotia and Phocis showed that the neolithic pottery of the Greek mainland was totally different from that of Crete and therefore that the underlying basis for the bronze age in these two main spheres of Aegean culture was by no means the same. This was supported by the results obtained by Dörpfeld in Leucas, where he found wares of all three periods (early, middle and late) and neolithic pottery with painted decoration closely akin to the Thessalian. Euboea produced tombs of the early bronze age, showing a striking likeness both to the wares of the Cyclades and to those of the mainland, and more tombs of the late period which indicate that the results obtained in this island coincide with those from elsewhere. Even before the war the American excavators had obtained hints that Corinth was likely to prove fertile in pre-historic remains, but not till 1915 was any great success won. Since that year the Americans under the leadership mainly of Blegen and Miss Walker have rewritten the early history of the mainland. A series of discoveries and excavations has shown that neolithic wares similar to those of Thessaly are to be found in the Peloponnese, where Corinth, Nemea, the Argive Heraeum and Arcadia have all yielded relics of this period. Further, largely as the result of the excavation of Korakou, a prehistoric port on the Gulf of Corinth near Lechaëum, supported by fruitful work at Zygouries (near Cleonae), Nemea and the Argive Heraeum, it has been possible to obtain a clear view of the three stages of the bronze age on the mainland.

The Aegean Area.—Traces of the early and middle bronze ages have also appeared in Laconia, and the German work at Amyclae has yielded many relics of the late period. At Asine, near Nauplia, a Swedish expedition under Persson has achieved brilliant results and recovered remains of all three periods. The same expedition at Dendra, near Midea, has excavated an unplundered beehive tomb which shows the burial ritual and found treasures richer than those of Vaphio. There is a splendid gold cup chased with a design of octopuses and dolphins, a gold and silver cup adorned with bulls' heads, silver cups, weapons of bronze, engraved sealstones of wondrous size, and pottery which dates the tomb to about 1350 B.C., the last period. Nearby is a chamber tomb, with a hoard of 33 bronze vessels, which, though empty of human remains, seems to have been a cenotaph and throws much light on the cult of the dead. At Mycenae the British work directed by Wace has found remains of all three periods of the bronze age, including a rich series of tombs of the last period, and established the history of the shaft graves found by Schliemann. The palace has been re-explored and, with the Lion Gate and walls, been found to date from the latter part of the last period, from 1400 B.C. The beehive tombs, also re-examined, can be dated with some degree of probability, and the finest, such as the Treasury of Atreus are seen to be contemporary with the Lion Gate. These results are confirmed by the renewed work of the Germans at Tiryns under Karo and Kurt Müller, who find that the palace and the walls, with three stages at least, are approximately contemporary with those of Mycenae. The Swedish finds at Dendra and in the beehive tombs of Bodia, in Messenia, agree with these conclusions, which all tend to show that after the fall of Knossos, about 1400 B.C., Mycenae as the chief stronghold of the mainland succeeded to the Aegean empire and spread Aegean culture far and wide.

Further work in Boeotia at Eutresis and other sites has extended our knowledge of the houses and culture of the two first periods, and on the Acropolis of Athens itself neolithic pottery of the Thessalian type has come to light as well as pottery of the early bronze age. The latest revelation comes from Samos, where bronze age pottery of the middle and late periods, it is said, has been discovered. Thus on the one hand new discoveries have emphasized the uniform and widespread character of the Aegean culture throughout the area, and on the other hand the latest finds on the mainland indicate considerable divergence between it and Crete. The last point is of vital importance in considering the historical and ethnological problems of Greece in the Aegean or pre-historic age. The "Aegean Area" now covers the Archipelago with Crete and Cyprus, the Hellenic peninsula with the Ionian isles, and western Anatolia. Evidence is also coming in from the Macedonian coast. Offshoots are found in the western Mediterranean, in Sicily, Italy, Sardinia, and in the East in Palestine and Egypt. About the Cyrenaica we are still insufficiently informed.

II. GENERAL NATURE OF THE EVIDENCE

For details of monumental evidence the articles on CRETE, MYCENAE, TIRYNS, TROY, CYPRUS, etc., must be consulted. The most representative site explored up to now is Knossos, which has yielded the most various and the most continuous evidence from the Neolithic age to the twilight of classical civilization. Next in importance are in Crete, Phaestus, Agia Triada, Mochlos, Vasilike, Tylissus, Gournia, Mallia and the tombs of Mesara; on the mainland, after Mycenae, Tiryns, Thebes, Asine, Korakou and the other sites already mentioned, are Agia Marina, Lianokladi and Tsangli; in the islands, Phylacope in Melos, and on the Anatolian littoral Hissarlik (Troy).

A. The *internal* evidence at present available comprises:—

(1) *Structures.*—Ruins of palaces, palatial villas, houses, built dome- or cist-graves and fortifications (Aegean isles, Greek mainland and north-west Anatolia), but not distinct temples; small shrines, however, and *temenê* (religious enclosures, remains of one of which were probably found at Petsofa, near Palaikastro, by J. L. Myres in 1904) are represented on intaglios and frescoes. From like sources and from inlay-work we have also representations of palaces and houses.

(2) *Structural Decoration.*—Architectural features, such as columns, friezes and various mouldings; mural decoration, such as fresco-paintings, coloured reliefs and mosaic inlay.

(3) *Furniture.*—(a) *Domestic*, such as vessels of all sorts and in many materials, from huge store-jars down to tiny unguent pots; culinary and other implements; thrones, seats, tables, etc., these all in stone or plastered terra-cotta; (b) *Sacred*, such as models or actual examples of ritual objects; of these we have also numerous pictorial representations; (c) *Funerary*; e.g., coffins in painted terra-cotta.

(4) *Artistic Fabrics*, e.g., plastic objects, carved in stone or ivory, cast or beaten in metals (gold, silver, copper and bronze), or modelled in clay, faience, paste, etc. No trace has yet been found of large free sculpture, but many examples exist of sculptors' smaller work. Vases of all kinds, carved in marble or other stones, cast or beaten in metals or fashioned in clay, the latter in enormous number and variety, richly ornamented with coloured schemes, and sometimes bearing moulded decoration. Examples of painting on stone, opaque and transparent. Engraved objects in great number; e.g., ring-bezels and gems; and an immense quantity of clay impressions, taken from these.

(5) *Weapons, tools and implements*, in stone, clay and bronze, and at the last iron, sometimes richly ornamented or inlaid. Numerous representations also of the same. No actual body-armour, except such as was ceremonial and buried with the dead, like the gold breastplates in the circle-graves at Mycenae.

(6) *Articles of personal use*, e.g., brooches (*fibulae*), pins, razors, tweezers, etc., often found as dedications to a deity; e.g., in the Dictaeon cavern of Crete. No textiles have survived.

(7) *Written documents*; e.g., clay tablets and discs (so far in Crete only), but nothing of more perishable nature, such as skin, papyrus, etc.; engraved gems and gem impressions; legends writ-

ten with pigment on pottery (rare); characters incised on stone or pottery. These show two main systems of script (*see* CRETE).

(8) *Excavated tombs*, of either the pit or the grotto kind, in which the dead were laid, together with various objects of use and luxury, without cremation, and in either coffins or *loculi* or simple wrappings.

(9) *Public works*, such as paved and stepped roadways, bridges, systems of drainage, etc.

B. There is also a certain amount of *external* evidence to be gathered from:—

(1) Monuments and records of other contemporary civilizations; *e.g.*, representations of alien peoples in Egyptian frescoes; imitation of Aegean fabrics and style in non-Aegean lands; allusions to Mediterranean peoples in Egyptian, Hittite, Semitic or Babylonian records.

(2) Literary traditions of subsequent civilizations, especially the Hellenic, such as, *e.g.*, those embodied in the Homeric poems, the legends concerning Crete, Mycenae, etc.; statements as to the origin of gods, cults and so forth, transmitted to us by Hellenic antiquarians such as Strabo, Pausanias, Diodorus, Siculus, etc.

(3) Traces of customs, creeds, rituals, etc., in the Aegean area at a later time, discordant with the civilization in which they were practised and indicating survival from earlier systems. There are also possible linguistic and even physical survivals to be considered.

III. GENERAL FEATURES OF AEGEAN CIVILIZATION

The leading features of Aegean civilization, as deduced from the evidence must be stated very briefly.

(1) **Political Organization.**—The great Cretan palaces and the fortified citadels of Mycenae, Tiryns and Hissarlik, each containing little more than one great residence, and dominating lower towns of meaner houses, point to monarchy at all periods. Independent local developments of art before the middle of the 2nd millennium B.C. suggest the early existence of independent units in various parts, of which the strongest was the Cnossian. After that date the evidence goes strongly to show that one political dominion was spread for a brief period, or for two brief periods, over almost all the area (*see* later). The great number of tribute tallies found at Cnossus perhaps indicates that the centre of power was there for some time.

(2) **Religion.**—The fact that shrines have so far been found within palaces and not certainly anywhere else indicates that the kings kept religious power in their own hands; perhaps they were themselves high-priests. Religion in the area seems to have been essentially the same everywhere from the earliest period; viz., the cult of divine principles, resident in dominant features of nature (sun, stars, mountains, trees, etc.) and controlling fertility. This cult passed through an aniconic stage, from which fetishes survived to the last, these being rocks or pillars, trees, weapons (*e.g.*, *bipennis*, or double war-axe, shield), etc. When the iconic stage was reached, about 2000 B.C., we find one divine spirit represented as a goddess with a subordinate young god, as in many other eastern Mediterranean lands. The god was probably son and mate of the goddess, and the divine pair represented the genius of reproductive fertility in its relations with humanity. The goddess at times appears, with doves, as uranic, at others with snakes, as chthonic. In the ritual fetishes, often of miniature form, played a great part: all sorts of plants and animals were sacred; sacrifice (not burnt, and human very doubtful), dedication of all sorts of offerings and *simulacra* invocation, etc., were practised. The dead were objects of a sort of hero-worship especially on the mainland. This early nature-cult, explains many anomalous features of Hellenic religion, especially in the cults of Artemis and Aphrodite (*see* CRETE).

(3) **Social Organization.**—There is a possibility that features of a primeval matriarchate long survived; but there is no certain evidence. Of the organization of the people under the monarch we are ignorant. There are so few representations of armed men that it seems doubtful if there can have been any professional military class. Theatral structures found at Cnossus and Phaestus,

within the precincts of the palaces, were perhaps used for shows or for sittings of a royal assize, rather than for popular assemblies. The Cnossian remains contain evidence of an elaborate system of registration, account-keeping and other secretarial work, which perhaps indicates a considerable body of law. The life of the ruling class was comfortable and even luxurious from early times. Fine stone palaces, richly decorated, with separate sleeping apartments, large halls, ingenious devices for admitting light and air, sanitary conveniences and marvellously modern arrangements, for supply of water and for drainage, attest this fact. Even the smaller houses, after the Neolithic period, seem also to have been of stone, plastered within. After 1600 B.C. the palaces in Crete had more than one storey, fine stairways, bath-chambers, windows, folding and sliding doors, etc. In this later period, the distinctions of blocks of apartments in some palaces has been held to indicate the seclusion of women in *harems*, at least among the ruling caste. Cnossian frescoes show women grouped apart, and they appear alone on gems. Flesh and fish and many kinds of vegetables were evidently eaten, and wine and beer were drunk. Vessels for culinary, table and luxurious uses show an infinite variety of form and purpose. Artificers' implements of many kinds were in use, bronze succeeding obsidian and other hard stones as the material. Seats are found carefully shaped to the human person. There was evidently olive- and vine-culture on a large scale. Chariots were in use in the later period, as is proved by the pictures of them on Cretan tablets and at Mycenae, Tiryns and Vaphio, and therefore the horse was known. Main ways were paved. Sports, probably more or less religious, are often represented; *e.g.*, bull-fighting, dancing, boxing and armed combats.

(4) **Commerce** was practised to some extent in very early times, as is proved by the distribution of Melian obsidian over most of the Aegean area and by the Nilotic influence on early Minoan art. We find Cretan vessels exported to Melos, Egypt and the Greek mainland. Melian vases came in their turn to Crete. After 1600 B.C. there is very close intercourse with Egypt, and Aegean things find their way to all coasts of the Mediterranean (*see* below). No traces of currency have come to light, unless certain axe-heads too slight for practical use, had that character; but standard weights have been found, and representations of ingots. The Aegean written documents have not yet proved (by being found outside the area) epistolary correspondence with other lands. Representations of ships are not common, but several have been observed on Aegean gems, gem-sealings and vases. There are also leaden and clay models of boats. They are vessels of low free-board, with masts. Familiarity with the sea is proved by the free use of marine motives in decoration.

(5) **Treatment of the Dead.**—The dead in the earlier period were laid (so far as we know at present) within cists constructed of upright stones. These were sometimes inside caves and occasionally clay coffins were used. After the burial the cist was covered in with earth. A little later, in Crete, bone pits seem to have come into use, containing the remains of many burials. Possibly the flesh was boiled off the bones at once ("scarification"), or left to rot in separate cists awhile; afterwards the skeletons were collected and the cists re-used. The royal shaft graves at Mycenae are an elaboration of the simple cist grave and the circle surrounding them finds a parallel in the grave rings at Leucas. Chamber tombs built in the early period occur in Crete and rock-cut tombs of the same general type approached by a horizontal or slightly inclined way with the sides converging above are very common on the mainland and in Rhodes in the last period, and are often found in Crete where small clay coffins containing skeletons in a crouching posture are usual. Circular ossuaries which some believe to have been roofed with vaults, occur in Crete in the early period and last into the beginning of the middle period; but the great beehive tombs of Mycenae and the mainland belong to the last period (from about 1500 B.C. onwards) and the finest, such as the treasury of Atreus, to the concluding phase of the bronze age after the fall of Crete about 1400 B.C. Sometimes in Crete at the end of the middle period the dead were trussed up and thrust head foremost into

large jars for burial. On the mainland at a slightly earlier date children are found buried in jars, and sometimes in place of stone cists the dead were surrounded by walls of crude brick or covered with fragments of large store jars. At no period do the Aegean dead seem to have been burned. Weapons, food, water, unguents and various trinkets were laid with the corpse at all periods. In the Mycenae circle an altar seems to have been erected over the graves, and on the mainland at least there are definite traces of the worship of the dead. A painted sarcophagus, found at Hagia Triada, also possibly shows a hero-cult of the dead.

(6) **Artistic Production.**—Ceramic art reached a specially high standard in fabric, form and decoration by the middle of the 3rd millennium B.C. in Crete. The products of that period compare favourably with any potters' work in the world. The same may be said of fresco-painting, and probably of metal work. Modelling in terra-cotta, sculpture in stone and ivory, engraving on gems, were following it closely by the beginning of the 2nd millennium. After 2000 B.C. all these arts revived, and sculpture, as evidenced by relief work, both on a large and on a small scale, carved stone vessels, metallurgy in gold, silver and bronze, advanced farther. This art and those of fresco- and vase-painting and of gem engraving stood higher about the 15th century B.C. than at any subsequent period before the 6th century. The manufacture, modelling and painting of faience objects, and the making of inlays in many materials were also familiar to Aegean craftsmen, who show in all their best work a strong sense of natural form and an appreciation of ideal balance and decorative effect, such as are seen in the best products of later Hellenic art. Architectural ornament was also highly developed. The richness of the Aegean capitals and columns may be judged by those from the "Treasury of Atreus" now set up in the British Museum; and of the friezes we have examples in Mycenaean and Cnossian fragments, and Cnossian paintings. The magnificent gold work of the later period, preserved to us at Mycenae, Dendra and Vaphio, needs only to be mentioned. It should be compared with stone work in Crete, especially the steatite vases with reliefs found at Hagia Triada. On the whole, Aegean art, at its two great periods, in the middle of the 3rd and 2nd millennia respectively, will bear comparison with any contemporary arts.

IV. ORIGIN, NATURE AND HISTORY OF AEGEAN CIVILIZATION

The evidence, summarized above, though very various and voluminous, is not yet sufficient to answer all the questions which may be asked as to the origin, nature and history of this civilization, or to answer any but a few questions with absolute certainty.

A. Distinctive Features.—The fact that Aegean civilization is distinguished from all others, prior or contemporary, not only by its geographical area, but by leading organic characteristics, has never been in doubt since its remains came to be studied seriously and impartially. The truth was indeed obscured for a time by persistent prejudices in favour of certain alien Mediterranean races long known to have been in relation with the Aegean area in prehistoric times; e.g., the Egyptians and especially the Phoenicians. Others put forward "Achaeans" from the north as its authors. But such claims to the authorship of the Aegean remains grew fainter with every fresh Aegean discovery and every new light thrown on their own proper products; with the Cretan revelations they ceased altogether to be considered except by a few Homeric enthusiasts. Briefly, we now know that the Aegean civilization developed these distinctive features: (1) An *indigenous script* expressed in characters of which only a very small percentage are identical, or even obviously connected, with those of any other scripts. This is equally true both of the pictographic and the linear Aegean systems. Its nearest affinities are with the "Asiatic" scripts, preserved to us by Hittite, Cypriote and south-west Anatolian (Pamphylian, Lycian and Carian) inscriptions. But neither are these affinities close enough to be of any practical aid in deciphering Aegean characters, nor is it by any means certain that there is parentage. The Aegean script may be, and probably is, prior in origin to the "Asiatic"; and it may equally well be
